AIRCRAFT ALLOCATION TABLE

This table gives, for each delivered aircraft, the cross reference between:

- The Manufacturing Serial Number (MSN).
- The Fleet Serial Number (FSN) of the aircraft as known by AIRBUS S.A.S.
- The registration number of the aircraft as known by AIRBUS S.A.S.
- The aircraft model.

M[1]	MSN	FSN	Registration Number	Model
	0040		ET-ATQ	350-941
	0043		ET-ATR	350-941
	0089		ET-ATY	350-941

M(1)	MODIFICATION	Linked SB	Incorp. Date	Title
	L04011		21 MAY 19	LANDING GEAR - LANDING GEAR MANAGEMENT SYSTEM - INTRODUCE REMOTE BRAKING CONTROL UNIT (RBCU) STANDARD H4-3
	Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB			
E	L04027	32-P037 00	21 MAY 19	LANDING GEAR - LANDING GEAR MANAGEMENT SYSTEM - INTRODUCE BCS SOFTWARE STANDARD S5B.
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
E	L06001	42-P013 00	21 MAY 19	FUEL - FUEL QUANTITY AND MANAGEMENT SYSTEM (FQMS) - DEFINE AND INSTALL FQMS V5.1 SOFTWARE STANDARD.
	Applicable to: ET-ATQ, ET-AUC, ET-AVB, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
E	L06006	42-P013 00	21 MAY 19	FUEL - FUEL QUANTITY AND MANAGEMENT SYSTEM (FQMS) - DEFINE AND INSTALL FQMS V5.1.1 SOFTWARE STANDARD.
	Applicable to: ET-ATQ, ET-AUC, ET-AVB, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L31465		10 NOV 16	AIR CONDITIONING - COCKPIT AIR DISTRIBUTION - Remove Cockpit Restrictor Valve in S.13/14
	Applicable to: ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L41091		02 AUG 17	AIR CONDITIONING-LOWER DECK CARGO COMPARTMENT VENTILATION:DEFINE AND INSTALL LOWER DECK FORWARD CARGO COMPARTMENT VENTILATION AND TEMPERATURE CONTROL
	Applicable to: ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L41105		04 MAY 16	AIR CONDITIONING - HUMIDIFICATION: DEFINE AND INSTALL COCKPIT HUMIDIFICATION SYSTEM
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB			
	L41114		06 MAY 15	COMMUNICATIONS - HF SYSTEM - Define and install a second HF system
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP			
	L41135		04 MAY 16	FUEL - REFUEL/DEFUEL SYSTEM - Define and Install refuel/defuel coupling on LH wing
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP			
	L41136		06 MAY 15	FUEL - JETTISON SYSTEM: Define and install Jettison Fuel System
	Applicable to: ALL			
	L41142		06 MAY 15	INDICATING/RECORDING SYSTEMS - HEAD UP DISPLAY (HUD): Define and install dual HUD
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC

M(1)	MODIFICATION	Linked SB	Incorp. Date	Title
	L41151		06 MAY 15	NAVIGATION - MULTI MODE RECEIVER (MMR) FUNCTIONS - Activate GLS function in the MMR.
	Applicable to: ALL			
	L41152		06 MAY 15	NAVIGATION - MULTI MODE RECEIVER (MMR) FUNCTIONS - Activate Satellite Landing System (SLS) in the MMR
	Applicable to: ALL			
	L41155		06 MAY 15	NAVIGATION - AUTOMATIC DIRECTION FINDING (ADF) - Define and install single ADF
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB			
	L41157		06 MAY 15	NAVIGATION - AUTOMATIC DIRECTION FINDING (ADF) - Define and install second ADF
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB			
	L41159		06 MAY 15	NAVIGATION - VOR/MARKER: Define and install VOR2/DME2
	Applicable to: ET-ATQ, ET-ATR			
	L41208		06 MAY 15	Air Conditioning - Commercial Equipment Ventilation - Define And Install Isolation Valve ISO1 For IFE Center Rack Ventilation
	Applicable to: ALL			
	L41387		08 NOV 18	LIGHTS - EXTERIOR - Define and Install Integrated Tail Cone Light and Single FWD Strobe Light
	Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L41612		06 MAY 15	Miscellaneous - Additional certification items - Certify 15 Knots Tailwind operation at Take-Off (RR ENGINES)
	Applicable to: ALL			
	L41830	31-P015 01	10 NOV 16	INDICATING/RECORDING SYSTEMS - CONTROL AND DISPLAY SYSTEM (CDS) - Define and install CDS S4 standard
	Applicable to: ALL			
	L41831	22-P006 01	04 AUG 16	AUTO FLIGHT - FLIGHT MANAGEMENT (FM) - Define FMS S4 standard
	Applicable to: ALL			
	L41838	22-P012 01	02 AUG 17	AUTO FLIGHT - Define and install Automatic Emergency Descent function
	Applicable to: ALL			
	L41839	42-P005 01	04 AUG 16	INDICATING/RECORDING SYSTEMS - FWS - ACQUISITION/INTERFACE - Define and install FWS S4/2.0 standard
	Applicable to: ALL

M(1)	MODIFICATION	Linked SB	Incorp. Date	Title
	L41917		06 MAY 15	LANDING GEAR - WHEELS AND BRAKES - Define and install Messier Bugatti (MBD) Wheels and Brakes
	Applicable to: ALL			
	L41944		06 MAY 15	INDICATING/RECORDING SYSTEMS - FLIGHT WARNING SYSTEM (FWS)- Activate Dual Operator Customized ECAM Database (OCED)
	Applicable to: ALL			
	L41953	22-P012 01	04 MAY 17	FLIGHT CONTROLS - PFCS - CONTROL INPUTS - Define new SBTU with EMER DESCENT push-button
	Applicable to: ALL			
	L42048		26 JAN 16	ELECTRICAL POWER - BATTERY MAIN GENERATION - Define and install Li-Ion Batteries system with a single exhaust pipe per side
	Applicable to: ALL			
	L42209		04 AUG 16	INDICATING/RECORDING SYSTEMS - INTEGRATED CONTROL PANELS (ICP) - Remove « No smoking » toggle switch from ICP LOWER CENTER
	Applicable to: ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L42260		06 MAY 15	NAVIGATION - AIRCRAFT ENVIRONMENT SURVEILLANCE SYSTEM (AESS): Define & install ATSAW Step 2A activation based on AESS EIS standard
	Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP			
	L42278		06 AUG 15	LANDING GEAR - WHEELS AND BRAKES - Introduce S3B software Standard for BCS (Braking Control System)
	Applicable to: ALL			
	L42332	32-P022 01	12 JUL 17	LANDING GEAR - STEERING - Introduce Wheel Steering Control System (WSCS) Software (S4)
	Applicable to: ALL			
	L42425		06 MAY 15	INDICATING/RECORDING SYSTEMS - CENTRAL WARNING SYSTEMS ¿ Introduce ATQC V2 for EIS
	Applicable to: ALL			
	L42430		06 MAY 15	INDICATING/RECORDING SYSTEMS - FWS - ACQUISITION/INTERFACE - Define and install FWS S3/5.0 standard
	Applicable to: ALL

M(1)	MODIFICATION	Linked SB	Incorp. Date	Title
	L42454		04 MAY 17	HYDRAULIC POWER - Increase robustness of HYDRAULICS architecture to improve ATA42 OR define wiring impacts for CRDC
	Applicable to: ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L42471	42-P003 01	04 AUG 16	HYDRAULIC POWER - Define new HMCA S4.0 software
	Applicable to: ALL			
	L42492		04 MAY 16	INDICATING/RECORDING SYSTEMS - INTEGRATED CONTROL PANELS (ICP)- Define and install ICP-LOWER CTR S3.2 configuration 1 with toggle switches re-oriented
	Applicable to: ET-ATQ, ET-ATR			
	L42495	42-P012 01	21 MAY 19	FLIGHT CONTROLS - PRIMARY FLIGHT CONTROL SYSTEM (PFCS) - Activate Take Off Monitoring (TOM) function
	Applicable to: ALL			
	L42544		06 MAY 15	FLIGHT CONTROLS - PRIMARY FLIGHT CONTROL SYSTEM (PFCS) - INTRODUCE FCGS 6.1 SW STD
	Applicable to: ALL			
	L42552		05 NOV 15	ICE AND RAIN PROTECTION - ICE DETECTION - Define and install AICF S3.1 standard
	Applicable to: ALL			
	L42571	28-P006 01	04 AUG 16	FUEL - FUEL QUANTITY AND MANAGEMENT SYSTEM (FQMS) - Define FQMS V4 Software Standard
	Applicable to: ALL			
	L42655		04 AUG 16	NAVIGATION - VOR/MARKER - Define and install VOR2/DME2 and uninstall the 50 ohms load
	Applicable to: ET-ATY, ET-AUA, ET-AUB, ET-AUC			
	L42665		09 MAY 18	FLIGHT CONTROLS - SPOILER - Introduce new std of Spoiler EBHA to solve undue active mode.
	Applicable to: ALL			
	L42666	24-P024 01	04 AUG 16	ELECTRICAL POWER - AC MAIN GENERATION - Define and install GCU S4
	Applicable to: ALL			
R	L42669		09 MAY 18	INDICATING/RECORDING SYSTEMS - FWS - ACQUISITION/INTERFACE - Activate ETC code n° 27SP Undue active mode on spoiler EBHA
	Applicable to: ALL			
	L42746	22-P008 01	04 MAY 17	AUTO FLIGHT - GENERAL - Upgrade BTV-ROPS function to Step 3 with all runway states
	Applicable to: ALL

M(1)	MODIFICATION	Linked SB	Incorp. Date	Title
	L42771		08 FEB 18	ICE AND RAIN PROTECTION - WINDSHIELD RAIN PROTECTION - Remove rain repellent system (Equipments only)
	Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L42782		22 NOV 17	NAVIGATION - VOR/MARKER - Define and install VOR2 receiver and uninstall 50 ohms load
	Applicable to: ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L42820		22 NOV 17	NAVIGATION - DISTANCE MEASURING EQUIPMENT (DME) - .Define and Install DME2 interrogator
	Applicable to: ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L42834		08 FEB 18	INDICATING/RECORDING SYSTEMS - HEAD UP DISPLAY (HUD) - Define and install Dual HUD compliant with optimized complete provisions
	Applicable to: ET-AVB			
	L42865		21 MAY 19	LIGHTS - EXTERIOR - Define and Install 3HID (Landing, Take-Off and RTO-Taxi lights) and 1HID (WES and Logo lights) in LED technology
	Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L42875	27-P013 01	12 JUL 17	FLIGHT CONTROLS - PRIMARY FLIGHT CONTROL SYSTEM (PFCS) - Define and Install FCGS SW X8.0.2 standard
	Applicable to: ALL			
	L42959		20 FEB 18	NAVIGATION - RADIO ALTIMETER - Define and install DLRA S3.2 standard
	Applicable to: ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L42973		12 MAY 16	LANDING GEAR - PARKING BRAKING - INTRODUCE NEW PARK BRAKE SELECTOR VALVE (PBSELV) CHECK VALVES
	Applicable to: ALL			
	L42980		08 FEB 18	ELECTRICAL POWER - BATTERY MAIN GENERATION - Define and Install Ni-Cad Batteries
	Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB			
	L43001		04 AUG 16	INDICATING/RECORDING SYSTEMS - FWS - ACQUISITION/INTERFACE - Activate ETC code 22TS - Inhibit TOS Pack 2 alerts
	Applicable to: ALL			
	L43174		08 AUG 19	NAVIGATION - SENSORS, POWER SUPPLY AND SWITCHING - Remove SSA probes and replace them by obturators
	Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

AIRCRAFT CONFIGURATION SUMMARY

Ident.: GEN-ACS-00022827.0001001 / 09 MAR 16
Applicable to: ALL

For awareness and for the specified aircraft, the following table provides the flight crew with a list of optional aircraft systems and functions related to flight and aircraft operations.

Ident.: GEN-ACS-00022828.0001001 / 09 MAR 16
Applicable to: ALL

Name	System	Installed

Ident.: GEN-ACS-00022832.0001001 / 09 MAR 16
Applicable to: ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

ADF	NAV	No

Ident.: GEN-ACS-00022832.0003001 / 09 MAR 16
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB

ADF (2 receivers)	NAV	Yes

Ident.: GEN-ACS-00024231.0002001 / 27 JUN 17
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD

Battery Type - Ni-Cad	ELEC	No

Ident.: GEN-ACS-00024231.0001001 / 27 JUN 17
Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

Battery Type - Ni-Cad	ELEC	Yes

Ident.: GEN-ACS-00023275.0001001 / 27 JUN 17
Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

Battery Type - Li-Ion	ELEC	No

Ident.: GEN-ACS-00023275.0002001 / 27 JUN 17
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD

Battery Type - Li-Ion	ELEC	Yes

Ident.: GEN-ACS-00022833.0001001 / 09 MAR 16
Applicable to: ALL

FMS - Continuous Descent Approach (CDA)	AUTO FLT	No

Ident.: GEN-ACS-00022834.0003001 / 09 MAR 16
Applicable to: ALL

GLS	NAV	Yes

Ident.: GEN-ACS-00024693.0001001 / 09 MAR 18
Applicable to: ALL

HPFD	CDS	No

Ident.: GEN-ACS-00022835.0001001 / 09 MAR 16

SLS	NAV	Yes

IF INSTALLED TABLE

Ident.: GEN-IFIT-00022829.0001001 / 09 MAR 16
Applicable to: ALL

The "If Installed" Table below provides a list of optional systems and functions of the aircraft. For most of the optional systems or functions associated with the "if installed" ◁ symbol in the FCOM, the table indicates if the optional systems or functions are installed, or not installed.

Note: *Highly customized options such as cabin installations are not covered in the following table.*

Ident.: GEN-IFIT-00022830.0001001 / 09 MAR 16

MAIN FCOM CHANGES

Applicable to: ALL

Ident.: GEN-GMAIN-00020946.0001001 / 28 APR 14

INTRODUCTION

PURPOSE

The purpose of the MAIN FCOM CHANGES section is to provide general information about the latest FCOM revisions, and to highlight the main changes.

L12

Note: *In addition, each Documentary Unit (DU) highlights the reason(s) for change, and contains revision bars to indicate the revised sections.*
For more information, Refer to GEN FCOM Revision Management.

TIMEFRAME

The MAIN FCOM CHANGES section is updated on a monthly basis, regardless of the revision cycle that is applicable to each Operator.
The subjects in the MAIN FCOM CHANGES are categorized by month, but include revision information only from the previous 6 months.

5 Ident.: GEN-GMAIN-00025533.0001001 / 07 JUL 20

JULY 2020

PROCEDURES - ABNORMAL PROCEDURES

Several Temporary Documentary Units (TDU) associated with Abnormal procedures are modified into classical DU in order to be in line with the new definition of the TDU published in January 2020.
For more information about the TDU standard definition, *Refer to GEN TDU General Description*.

PROCEDURES - ABNORMAL AND EMERGENCY PROCEDURES - OIS

Correction of the OIS CAPT + F/O OIS DISPLAY FAULT ECAM alert in order to reflect the ECAM actions that are displayed on the WD.
Since the FWS Standard S4.2, the procedure offers the possibility to perform a reset of the OIS if the failure of the display is caused by the OIS.

6 Ident.: GEN-GMAIN-00025502.0001001 / 10 JUN 20

JUNE 2020

AIRCRAFT SYSTEMS - ENGINES - TEMPORARY ABNORMAL BEHAVIORS

Introduction of a new Temporary Abnormal Behavior “Erroneous Detection of Engine Fuel Leak” to indicate a possible spurious display of the ENG 1(2) FUEL LEAK SUSPECTED ECAM alert in case of fuel flow discrepancy between the engines, due to an engine misbehavior.
This enables to keep the affected engine running if the alert is confirmed spurious.

NORMAL PROCEDURES - STANDARD OPERATING PROCEDURES - DESCENT PREPARATION - ROP

Introduction of a new TDU to modify the tasksharing when a pilot enters a runway shift on the ANF. As the offside ANF is not fully synchronized, the CM2 enters the runway shift, instead of PF.
This avoids a possible spurious ROW/ROP alert and a strong deceleration rate in BTV mode.

NORMAL PROCEDURES - STANDARD OPERATING PROCEDURES - DESCENT PREPARATION - AUTOBRAKE

Introduction of a new TDU to modify the tasksharing when a runway shift is entered during ROW/ROP preparation. After CM2 enters the runway shift, CM2 continues with BTV preparation and arming (if BTV is used).
This ensures a continuous flow and avoids a possible spurious ROW/ROP alert and a strong deceleration rate in BTV mode.

NORMAL PROCEDURES - STANDARD OPERATING PROCEDURES - TASKSHARING

Introduction of a new TDU to take into account the modifications of the "Descent Preparation" tasksharing when a runway shift is entered during ROW/ROP preparation.

NORMAL PROCEDURES - SUPPLEMENTARY PROCEDURES - FLIGHT WITH GEAR DOWN

Modification of the environmental temperature envelope of the A350-900 to ensure that the temperature of the aircraft components exposed to the outside air is above their qualification temperature.

7 Ident.: GEN-GMAIN-00025480.0001001 / 01 JUN 20

MAY 2020

No major change in this revision.

Ident.: GEN-GMAIN-00025469.0001001 / 09 APR 20

APRIL 2020

AIRCRAFT SYSTEMS - ROW/ROP - BTV - TEMPORARY ABNORMAL BEHAVIORS

Introduction of a new Temporary Abnormal Behavior for A350-900 equipped with PRIM P12. On the RWY CONDITION / BRAKING ACTION matrix, the “Too Short Selection” indication (amber and black barber pole) may not appear in front of the WET / GOOD line when the runway is too short.

Ident.: GEN-GMAIN-00025450.0001001 / 05 MAR 20

MARCH 2020

AIRCRAFT SYSTEMS - AFS - FLIGHT MANAGEMENT SYSTEM - TEMPORARY ABNORMAL BEHAVIOR

Introduction of a new Temporary Abnormal Behavior. On ground or in flight, when the distance between two successive waypoints of the flight plan (active or secondary) is less than 2 NM with a predicted speed of more than 250 kt and a course change equal or above 3 °, the FMS may reset as long as the conditions listed above are present.

If this situation is identified by the Flight Crew, they should delete one of the two waypoints in each F-PLN containing these conditions (active, secondary, or uplinked).

PROCEDURES - NORMAL PROCEDURES - SUPPLEMENTARY PROCEDURES - ENGINES - CROSSBLEED ENGINE START

Modification of the temporary (TDU) procedure CROSSBLEED ENGINE START - AFTER START . The time during which the thrust lever is set above idle changes from 1 min to 30 s. This time is sufficient to avoid triggering the ENG STATOR A-ICE VLV CLOSED ECAM alert.

Ident.: GEN-GMAIN-00025411.0001001 / 06 FEB 20

FEBRUARY 2020

AIRCRAFT SYSTEMS - LANDING GEAR - BRAKING SYSTEM - TEMPORARY ABNORMAL BEHAVIOR

Introduction of two Temporary Abnormal Behaviors. In some failure modes of the landing gear lever, the Brake Control System (BCS) may consider the landing gear lever in an erroneous position. Each TAB provides a procedure to be applied in this situation to identify the failure mode.

FCOM PURPOSE

Applicable to: ALL

Ident.: GEN-GPURP-00020640.0001001 / 28 APR 14

GENERAL

The Flight Crew Operating Manual (FCOM) is a support documentation for flight crew.

The purpose of the FCOM is to:
- Provide all necessary operating limitations, procedures, techniques, performance and system information the flight crew needs to safely and efficiently operate the A350 during normal, abnormal and emergency situations.
- Serve directly as a Flight Crew Operating Manual, or as a basis for Operators to develop their own customized Airline Operations Manual, in accordance with applicable requirements
- Serve as a comprehensive reference guide during initial and refresher flight crew training.

Note: *This manual is not designed:*
- *To teach basic piloting skills*
- *To provide basic piloting techniques applicable to jet aircraft , or information, that are considered as basic airmanship for trained flight crews who are familiar with that type of aircraft and its general handling characteristics.*

The Flight Crew Operating Manual (FCOM) complements the Airplane Flight Manual (AFM).
If the FCOM data differs from the AFM data, the AFM remains the reference.

As a supplement to the FCOM, the FCTM may provide additional information that the flight crew should read in conjunction with the FCOM. For more information, *Refer to FCTM/GI FCTM Purpose*.

Ident.: GEN-GPURP-00020800.0001001 / 07 JUL 16

QUESTIONS AND SUGGESTIONS

For any questions or comments related to this manual, the Operator’s Flight Operations Management can contact the Airbus Flight Operations Support and Training Standard department.

FCOM CONTENTS

Ident.: GEN-00020808.0001001 / 03 JAN 20

Applicable to: ALL

The FCOM has four sections:

L12
- Aircraft Systems : This section is divided into ATA chapters for each aircraft system. This section includes a specific description of each system and its associated cockpit interfaces.
  When several layouts are possible for the same cockpit interface (e.g. when the position of the ON/OFF label of a switch changes depending on the aircraft configuration), the FCOM may describe only one typical layout.
- Procedures : This section contains the following chapters:
  - Normal Procedures that include the SOPs and Supplementary Procedures
  - Abnormal and Emergency Procedures
  - Special Operations.

L12
- Limitations : This section provides the aircraft and system limitations that the flight crew must know or refer to in operations.
  This section is divided into aircraft and system-related limitations in a similar way to the ABNORMAL And EMERGENCY PROCEDURES section.
- Performance : This section includes the aircraft performance for each flight phase.

Note: *The Operators are responsible for customizing the structure and the content of their documentation at their convenience, in accordance to their fleet configuration and applicable local requirements.*

In addition, the FCOM has the following chapters, as required:

L12	List of Modifications (LOM)	:	The LOM provides a list of aircraft modifications, also referred to as criteria (Modification Proposals (MPs) and Service Bulletins (SBs), that affect the FCOM. For more information, *Refer to GEN FCOM Revision Management*.
L12	General Summary of Highlights (SOH)	:	The General SOH chapter provides a list of all changes and associated reasons of the FCOM revision. For more information, *Refer to GEN FCOM Revision Management*.
L12	Operations Engineering Bulletins (OEBs)	:	The OEB chapter provides a list and description of all applicable Operations Engineering Bulletins (OEBs). For more information, *Refer to OEB-000 Introduction*.
L12	Temporary Abnormal Behaviors	:	This section provides the list of all abnormal behaviors of the FCOM with a link to access the appropriate FCOM section. For more information, *Refer to GEN TAB General Description*
L12	Temporary Documentary Units (TDUs)	:	The TDU chapter provides a list of all applicable Temporary Documentary Units (TDUs). For more information, *Refer to GEN TDU General Description*.

HOW CAN AN OPERATOR OBTAIN AN UPDATED FCOM?

Ident.: GEN-00020936.0001001 / 13 MAY 14
Applicable to: ALL

Airbus provides the Operator/aircraft owner with a FCOM that corresponds to the aircraft configuration at delivery, and the necessary revisions further to any configuration change associated to Airbus-approved modifications.
The Operator/owner must inform Airbus without delay of the effective changes to the aircraft delivery configuration made through Airbus Service Bulletin (SB). This permits Airbus to provide the Operator/owner with the FCOM revisions/updates.
The Operator/owner must timely report any SB installation to the following address:

e-mail : sb.reporting@airbus.com

Airbus will not provide revisions, and will not take responsibility for any effect on the FCOM:
- Due to modifications installed by third parties without an Airbus SB, and/or
- Due to modifications installed through an Airbus SB, if Airbus is not informed of the SB installation.

FCOM USE AND ORGANIZATION

Applicable to: ALL

Ident.: GEN-GUSEO-00020932.0001001 / 28 APR 14

DOCUMENTARY UNIT (DU)

The FCOM is made of Documentary Units (DU). The DU is the smallest part of information with a technical content.

DU IDENTIFICATION STRIP

The information is available in the OPS LIBRARY consultation toolbar by selecting the “DOC REF” option in the INFO drop down list. Once "DOC REF" is selected, above the title of the DU, the gray identification strip indicates for each DU:

- The DU identification (Id.). Each DU is identified by its unique identification number.
- The DU date. This date corresponds to the date at which the DU has been revised.
- The “Criteria” field that indicates the aircraft configuration to which the DU applies.

Note: *XW stands for Xtra Widebody meaning that this DU is applicable to the A350 family.*

- The "Applicable to" field that provides the list of the aircraft to which the DU applies.

Note: *This field may indicate either MSN or aircraft registration number, depending on customization. When MSN is used, the field may display a range of values, for e.g. 0012-0220 that indicates all MSNs from MSN 0012 up to and including MSN 0220.*

Ident.: GEN-GUSEO-00020843.0001001 / 28 APR 14

INFORMATION TYPES AND LAYERS

The FCOM has technical information that may be used for:

- Flight crew operations in flight, or on ground
- Refresher training.

Therefore, the FCOM is organized in three layers as follows:

- Layer 1: "Need to know"
  Layer 1 presents information that is necessary in the cockpit.
- Layer 2: "Nice to know"
  Layer 2 presents information that is used as a reference, in order to fully understand the logic of the aircraft and pilot interfaces.
- Layer 3: Detailed information.
  Layer 3 provides more detailed explanations, that are not necessarily needed in flight.

The text in each layer appears on a different colored background.

When the flight crew selects a layer of information, it remains selected during the consultation of several documentary units.

Ident.: GEN-GUSEO-00020849.0001001 / 02 MAY 14

HOW TO USE THE FCOM

For more information on the EFB "OPS LIBRARY" application that hosts the FCOM manual, *Refer to DSC-46-OIS-20-80-70 OPS LIBRARY*.

Ident.: GEN-GUSEO-00020852.0001001 / 09 MAR 16

OPTIONAL EQUIPMENT

The legend ◁ (If Installed) indicates that a paragraph or an illustration is applicable only if the related optional equipment is installed.

FCOM REVISION MANAGEMENT

Applicable to: ALL

Ident.: GEN-GREVM-00020882.0001001 / 18 JUN 15

FCOM REVISION CYCLE

The FCOM revision adds, updates, or deletes information. The Operator determines the revision cycle.
When necessary (e.g. need for urgent update), Airbus issues an immediate revision regardless of the revision cycle.

FCOM ISSUE DATE

An issue date identifies each FCOM revision.
The issue date appears at the top of the Navigation Tree of the EFB OPS LIBRARY application.

HIGHLIGHTS AND REVISION MARKS

A vertical bar in the margin of the DU identifies the modified part.
The vertical bar is available in the OPS LIBRARY consultation toolbar by ticking the “REV MARKS” option in the INFO drop down list.
L2 For more information, *Refer to DSC-46-OIS-20-80-70 INFO List*.
L1 The user can display the associated reason of the change by clicking on the bar.
L2 If the change is significant, the reason for the change is in bold.
L1 The General Summary Of Highlights (General SOH) provides a list of all changes and associated reasons of the FCOM revision.

FCOM REVISION CONTENTS

Each FCOM revision contains the following information that is useful to update the FCOM and to identify the changes that the revision has inserted:
- The General SOH
- The List of Modifications (LOM).

GENERAL SUMMARY OF HIGHLIGHTS (GENERAL SOH)

The General SOH chapter provides the list of all the changes inserted by a FCOM revision. For each change, the General SOH provides:
- A link to the applicable part of the manual affected by the change
- The technical reason for each revision.

LIST OF MODIFICATIONS (LOM)

The LOM provides a list of aircraft modifications, also referred to as criteria (Modification Proposals (MPs) and Service Bulletins (SBs), that affect the FCOM.

The LOM also indicates:
- The title of the criteria
- The date of incorporation of the criteria in the FCOM
- The list of aircraft that have the criteria
- The “M” field that may indicate the following Evolution Code:
  - The “E” letter indicates an aircraft effectivity change for the criteria: The list of aircraft to which the criteria applies has changed compared to the previous FCOM revision, by addition or deletion of one or several aircraft
  - The “N” letter indicates new criteria added by this FCOM revision
  - The “R” letter indicates a change in the criteria title or associated SB.

Ident.: GEN-GREVM-00020886.0001001 / 28 APR 14

OPERATIONS ENGINEERING BULLETINS

Operations Engineering Bulletins (OEB) are issued when it is necessary to rapidly transmit technical and procedural information.
The OEB chapter provides a list of all applicable OEBs.
L2 For more information, *Refer to OEB-000 Introduction*.

DEFINITIONS

Ident.: GEN-00020887.0001001 / 03 JUL 20
Applicable to: ALL

8

CAUTION	:	An operating procedure, technique, or information that may result in damage to equipment if not followed.
Daylight operations	:	Period between the beginning of the morning civil twilight and the end of the evening civil twilight relevant to the local aeronautical airspace, or such other period, as may be prescribed by the appropriate Authority.
Extended overwater flight	:	A flight where the aeroplane is operated over water at a distance away from land greater than 400 NM.
Icing conditions	:	Icing conditions exist when OAT on the ground and for takeoff, or TAT in flight is 10 °C (50 °F) or below and visible moisture in any form is present (such as clouds, fog with visibility of 1 sm/1 600 m or less, rain, snow, sleet or ice crystals). Icing conditions also exist when the OAT on the ground and for takeoff is 10 °C (50 °F) or below when operating on ramps, taxiways, or runways where surface snow, ice, standing water or slush may be ingested by the engines or freeze on engines, nacelles or engine sensor probes.
LAND ANSA	:	Land At Nearest Suitable Airport. Consider landing at the nearest suitable airport. *Note:* *The suitability criteria should be defined in accordance with the Operator's policy.*
LAND ASAP	:	Land As Soon As Possible. Land as soon as possible at the nearest airport at which a safe landing can be made. *Note:* *LAND ASAP information is applicable to a time-critical situation.*
Note	:	An operating procedure, technique, or information that is considered essential to emphasize. Information contained in notes may also be safety related.
VMC	:	Under IFR or VFR, the crew must maintain Visual Meteorological Conditions (VMC).

WARNING	:	An operating procedure, technique, or information that may result in personal injury or loss of life if not followed.

TDU GENERAL DESCRIPTION

Ident.: GEN-00025364.0001001 / 03 JAN 20
Applicable to: ALL

A TDU in the FCOM informs the flight crew about a temporary change in a normal Standard Operation Procedure, Advisory or Limitations. The TDU contains the reason for change in order to better understand and memorize this temporary change.

The TDU contains several indications:
- The date of application of the new or revised content
- The reason for change explains why the section is updated with a short general description of the malfunction
- The yellow dash line indicates the affected documentary unit
- When applicable, the arrow link provides a link to the previous content.

TAB GENERAL DESCRIPTION

Ident.: GEN-00025365.0001001 / 03 JAN 20
Applicable to: ALL

A TAB is a description of a system behavior that temporarily deviates from the intended system design and that the flight crew can notice.
The TAB enables the flight crew to better recognize, understand and if applicable, react to the abnormal system behavior in order to avoid any undue operational delay.
When applicable, temporary abnormal behaviors are described in the related section of the Aircraft System in a dedicated product folder identified as "Temporary Abnormal Behaviors".
Each TAB contains a description of the malfunction with an alternative instruction called "Operational recommendation" (if applicable).

OVERVIEW

Ident.: DSC-20-10-00000001.0001001 / 24 APR 14
Applicable to: ALL

The Airbus A350 is a subsonic, medium to long range aircraft designed for commercial transportation of passengers and cargo.

ENGINES

Ident.: DSC-20-10-00016612.0001001 / 24 APR 14
Applicable to: ALL

The aircraft has two high bypass turbofan engines, mounted under the wings.

COCKPIT

Ident.: DSC-20-10-00000088.0001001 / 24 APR 14
Applicable to: ALL

The cockpit has:
- One seat for the captain
- One seat for the first officer
- Two additional seats for the observers.

CABIN

Ident.: DSC-20-10-00000095.0001001 / 01 MAR 17
Applicable to: ALL

The passenger seating layout may vary, depending on Operator requirements.

CARGO

Ident.: DSC-20-10-00000096.0001001 / 24 APR 14
Applicable to: ALL

The aircraft has three cargo compartments:
- Forward cargo compartment
- Aft cargo compartment
- Bulk cargo compartment.

CREW REST COMPARTMENT

Ident.: DSC-20-10-00000097.0002001 / 14 JUN 16
Applicable to: ALL

The aircraft can have two crew rest compartments:
- A Flight Crew Rest Compartment ◁ for the flight crew members
- A Cabin Crew Rest Compartment ◁ for the cabin crew members.

Both types of crew rest compartments are installed in the overhead area with access from the main deck.

Note: *These crew rest compartments may not correspond to the customized configuration of a specific aircraft. For more information on the installed equipment, refer to the relevant chapter's system description.*

MAIN DIMENSIONS

Ident.: DSC-20-20-10-00000098.0001001 / 03 NOV 16
Applicable to: ALL

FUSELAGE

Ident.: DSC-20-20-10-00000099.0001001 / 24 APR 14
Applicable to: ALL

The aircraft fuselage has:
- In the cabin : 8 passengers doors
- In the cargo compartments: 3 cargo doors (forward, aft and bulk cargo doors).

The cabin can have up to 10 seats abreast in each row.

WING

Ident.: DSC-20-20-10-00000513.0001001 / 24 APR 14
Applicable to: ALL

The wing has two engine pylons.

L2 It has an area of 432.1 m^2 (4 652 ft^2) and spans 64.75 m (212.44 ft) with winglet (59 m (194 ft) without winglet).

L1 Each half-wing has the following moving surfaces:
- Two ailerons
- Seven upper wing control surfaces that are used in various combinations as spoilers, air brakes, or lift dumpers
- Seven slat surfaces for high-lift configurations
- Two flap surfaces for high-lift configurations.

The wing is also used as a fuel tank.

TAIL

180 DEGREES TURN ON RUNWAY

Ident.: DSC-20-30-00023473.0001001 / 27 JUN 17
Applicable to: ALL

With the recommended 180° turn technique, on dry runway, the approximate turn width without margin is:
- For the A350-900, 53 m (174 ft)
- For the A350-1000, 59 m (194 ft).

Note: *The flight crew should consider additional margin when the runway is wet or contaminated.*

For more info on the recommended 180° turn technique, *Refer to FCTM/PR-NP-SOP-100 180 degrees Turn on Runway*.

OVERVIEW

Ident.: DSC-21-COND-10-10-00001535.0001001 / 24 APR 17
Applicable to: ALL

The aircraft is equipped with an Air Conditioning System (ACS) supplied by the Bleed Air System (BAS), and a Supplemental Cooling System (SCS) which is electrically powered.

AIR CONDITIONING SYSTEM

The ACS is fully automatic. It provides continuous air renewal, and maintains a constant selected temperature in the cockpit and in the cabin zones.

L3 The control of the ACS functions is hosted in CPIOMs H41 and H42.

L1 Air from the ACS is also used for cargo temperature control.
The BAS supplies two air conditioning packs, with air from the engines, the APU, or the ground air supply. For more information, *Refer to DSC-36-10-10 Overview*. This air is cooled in the packs.

L2 The Air System Control Unit (ASCU) controls the pack. There is one ASCU per pack. The ASCU is a dual-lane controller.
The ASCU controls the Conditioned Service Air Supply (CSAS). The (CSAS) supplies pressurizes and cools air to the Inert Gas Generation System (IGGS). For more information, *Refer to DSC-28-10 Fuel Tank Inerting System*.

L1 This cooled air then flows out of the packs, and is combined with recycled cockpit and cabin air in the Mixer unit.

L2 The mixer unit has two mixing stages: The two premixer stages and the mixer unit. In the premixer, the air from the pack is combined with the recycled air.

L1 Then, hot air from the bleed system is added to the mixed air, to obtain the selected temperature throughout the cockpit and cabin zones.
There are temperature selectors on the overhead panel, and in the cabin on the Flight Attendant Panels (FAPs).
In case both packs fail, the mixer unit can directly receive air from outside the aircraft, through the emergency ram air inlet.

SUPPLEMENTAL COOLING SYSTEM

The aircraft is equipped with a liquid cooling system which supplies cooling to the galleys. For more information, *Refer to DSC-21-COND-10-40 Supplemental Cooling System*.

PACKS

Ident.: DSC-21-COND-10-20-00001536.0001001 / 31 MAY 16
Applicable to: ALL

The packs provide cold air by cooling hot bleed air.
There are two packs, and they operate automatically and independently of each other.
Each pack has two heat exchangers, one cooling unit (or Air Cycle Machines (ACM)), and one pack controller.

L2 The pack controller is part of the Air System Control Unit (ASCU). There is one ASCU per pack.

L1 In the event ACM fails, bleed air is cooled by the heat exchangers only: The pack operates in bypass mode. For more information, *Refer to DSC-21-COND-30 Air Cycle Machine (ACM) Failure*.
The pack controllers each have two independent channels, and each of these channels can control the entire pack.
In the event a pack controller fails, the associated pack is lost.
For each pack, there are two pack valves. Only one is active, the other is in standby. The pack valve regulates the quantity of hot bleed air that flows into each pack. The pack valves are automatically controlled by the pack controller, in accordance with the AIR FLOW selector position.

L2 The active pack valve of a pack will automatically close, if:
- There is not sufficient upstream pressure, or
- The FIRE pb-sw of the associated engine is pressed, or
- The associated PACK pb is set to OFF, or
- The associated pack overheats, and the aircraft is on ground, or
- There is a leak detection, or
- The onside engine starts.

All active pack valves (of both packs) will automatically close, if:
- The DITCHING pb-sw is set to ON, or
- During any engine start, and the crossbleed valve is open, or
- The FIRE pb-sw of any engine is pressed, and the crossbleed valve is opened.

L3 PACK DESCRIPTION

The hot bleed air flows into each pack, via the two pack valves, then enters the primary heat exchanger. This primary heat exchanger precools the air using external air. This external air enters through a ram air inlet door, and is then discharged overboard through a ram air outlet door.

Pack

☐ Outside Air
Pack
Outside Air
Ram Air Inlet Door
Main Heat Exchanger
Hot Air Valve
Pack Valves
Bleed Air
Primary Heat Exchanger
ACM
Pack Outlet
Ram Air Outlet Door
PDHV
TCV

The cooled bleed air then enters the ACM for further cooling.

A Temperature Control Valve (TCV) adjusts the pack outlet temperature, by adding air to the pack outlet flow:

- Below FL 220, air for temperature adjustment comes from the pack valves via the Pack Discharge Heating Valve (PDHV) to prevent ice formation.
- Above FL 220, the air is sufficiently dry. The (PDHV) is full closed, therefore air for temperature adjustment comes from the primary heat exchanger.

For pack operation, the pack controller controls all the above-mentioned valves and doors.

MIXER UNIT

Ident.: DSC-21-COND-10-20-00001537.0001001 / 15 APR 14
Applicable to: ALL

A mixer unit combines cold air from the packs with recycled air from the cabin.

L2 The mixer has two mixing stages: The premixer and the mixer unit. In the premixer, the air from the pack is combined with the recycled air. The premixer is designed to cope with the flow range of recirculation fans and packs, for normal and abnormal operation. It also prevents any ice aggregation.

The cabin air recirculates to reduce the bleed air demand from the packs.

L1 There are four recirculation fans that recirculate cabin air to the mixer unit.

L2 For more information about cabin air recirculation, *Refer to DSC-21-VENT-10-30 Cabin Air Recirculation*.

Cool Air
Cold Air

L3 The recirculation fans are in the underfloor area of the deck.

The recirculation fans are controlled by the ASCU.

L1 On ground, when the packs are off, the mixer unit can obtain cold air through the Low Pressure (LP) ground inlets that are connected to the ground carts.

In case both packs fail in flight, the mixer unit can obtain external air through an emergency ram air inlet. For more information, *Refer to DSC-21-COND-10-20 Emergency Ram Air*.

TRIM AIR SYSTEM

Ident.: DSC-21-COND-10-20-00001538.0001001 / 21 SEP 16
Applicable to: ALL

The trim air system adjusts the temperature of the air in each cockpit and cabin zone. Temperature is adjusted by adding hot air from the bleed system to air from the mixer unit. Hot air is added via two hot-air valves and one trim air valve per zone.

L3 The hot-air valves regulate and shut off the hot-air pressure in the trim air system.

Distribution to the cockpit and cabin zones is made via:

- Two hot-air manifolds
  Each hot-air valve feeds one of the manifolds.
  The two manifolds are interconnected by a Trim Air Shut-Off Valve (TASOV).
  The TASOV is closed, but it opens, in case one hot-air valve fails.
  Associated with the following ECAM alert: COND HOT AIR 1(2) FAULT (*Refer to procedure*).
- Trim air valves
  There is one trim air valve for each one of the cockpit and cabin zones. Each trim air valve adds hot bleed air, from the hot-air manifold, to the air that comes from the mixer unit, to obtain the selected temperature in its assigned zone.

The ASCUs control the temperature. Each ASCU controls one-half of the temperature sensors.

EMERGENCY RAM AIR

Ident.: DSC-21-COND-10-20-00001539.0001001 / 23 APR 14
Applicable to: ALL

An emergency ram air inlet ventilates the cockpit and cabin, in the event that both packs fail.
The RAM AIR pb-sw on the AIR panel activates the emergency ram air. When set to ON, air from outside the aircraft flows through the emergency ram air inlet, to the mixer unit, to continue ventilating and cooling both the cockpit and cabin.

L3 The ram air inlet is on the belly fairing.

L1 The ram air inlet opens, only if differential pressure is less than 2 PSI.

L3 If differential pressure is more than 2 PSI, a check valve, downstream of the emergency ram air inlets, will not open. Therefore, no air will be supplied to the mixer unit.

Intentionally left blank

COCKPIT AND CABIN ZONES

Ident.: DSC-21-COND-10-30-00001540.0001001 / 29 MAY 17
Applicable to: ALL

TEMPERATURE REGULATION

The flight crew can:
- Select the cockpit temperature with the COCKPIT selector on the AIR panel
- Select the cabin temperature with the CABIN selector, if the temperature of each cabin zone cannot be selected from the Flight Attendant Panels (FAPs)
- Set the CABIN selector to PURS SEL. In this case, the cabin crew can directly select the temperature of each cabin zone from the FAPs.

L2 The temperature selection ranges from 18 °C to 30 °C.

L3 The pack controller automatically controls the pack outlet temperature to set the temperature of the mixer unit to the lowest cabin zone temperature demand. Therefore, the zone with the lowest heating demand does not receive any trim air.

The pack controller regulates the outlet temperature of its associated pack by adjusting:
- The Temperature Control Valve (TCV)
- The ram air inlet
- The ram air outlet
- The Pack Discharge Heating Valve (PDHV)

Each trim air valve adjusts the temperature of its assigned cockpit and cabin zone.

L1 FLOW REGULATION

The flight crew can use the AIR FLOW selector on the AIR panel to adjust the flow of cold air from the packs, and recirculated air from the cabin.

L2 If only one pack operates, or if the APU supplies bleed air, the pack controller automatically adjusts the airflow to high (HI) demand, regardless of the selection on the AIR FLOW selector.

L1 AUTOMATIC MODE

When the flight crew sets the AIR FLOW selector to NORM, the airflow in the cabin/cockpit is automatically controlled, depending on the number of passengers entered on the MFD, the aircraft flight level, and the temperature regulation of the forward cargo compartment ❄ on the CARGO AIR COND panel.

L2 The airflow in the cockpit and cabin is automatically controlled by:
- The pack controllers, that control the pack valves
- The ventilation controllers, that control the rotation speed of the cabin fans.

L1 MANUAL MODE

When the flight crew sets the AIR FLOW selector to one of the following positions, the airflow in the cockpit/cabin is manually selected:

- AIR FLOW selector set to MAN: The pack airflow is at a default value
  L2 The default value corresponds to an airflow rate for a typical three-class cabin layout with all seats occupied.
- L1 AIR FLOW selector set to LO: The pack airflow is 80 % of the MAN value.
  The selection of the LO air flow with more than 340 cabin occupants is not permitted
- AIR FLOW selector set to HI: The pack airflow is equal to or more than 120 % of the MAN value.

BULK CARGO COMPARTMENT

Ident.: DSC-21-COND-10-30-00001541.0001001 / 03 JUL 20
Applicable to: ALL

1 The bulk cargo compartment has a heating system.
L2 The aft ventilation controller controls this system.
L1 Some air from the cabin recirculates into the bulk cargo compartment for ventilation and temperature control. This air is extracted by the bulk cargo extraction fan.
The TEMP REGUL selector on the cargo AIR COND panel controls the minimum air temperature in the bulk cargo compartment.
If the temperature is lower than the minimum air temperature set on the TEMP REGUL selector, an electrical heater heats the air that flows into the bulk cargo compartment.

Note: *The bulk cargo temperature control system cannot cool down the temperature.*

Two isolation valves (one inlet and one outlet isolation valve) permit the isolation of the bulk cargo compartment. These valves are manually controlled using the BULK ISOL VALVES pb-sw on the CARGO AIR COND panel.

Note: *In case of SMOKE AFT/BULK CARGO SMOKE ECAM alert:*
- *The isolation valves close automatically*
- *The heater and the extraction fan stop.*

FWD CARGO COMPARTMENT VENTILATION AND TEMPERATURE REGULATION ◅

Ident.: DSC-21-COND-10-30-00001542.0001001 / 03 JUL 20
Applicable to: ALL

2 The forward cargo compartment has a temperature regulation system, that uses air from the air conditioning system.

L2 The forward ventilation controller controls this system.

L1 Some air from the air conditioning system flows into the forward cargo compartment for ventilation and temperature regulation. This air is extracted by the forward cargo extraction fan.

L2 The temperature of the forward cargo compartment is regulated with air from the:
- Cabin
- Mixer unit
- Trim air system.

L3 A trim air valve is assigned to the forward cargo compartment.

L1 The flight crew selects the temperature of the forward cargo compartment with the FWD TEMP REGUL selector on the CARGO AIR COND panel.

If necessary, it is possible to isolate the forward cargo compartment, by closing the three isolation valves (two inlet isolation valves and one outlet isolation valve) of the forward cargo via the FWD ISOL VALVES pb-sw on the CARGO AIR COND panel.

Note: *In case of SMOKE FWD CARGO SMOKE ECAM alert:*
- *The isolation valves close automatically*
- *The extraction fan stops.*

SUPPLEMENTAL COOLING SYSTEM

Ident.: DSC-21-COND-10-40-00001633.0001001 / 30 APR 14
Applicable to: ALL

The Supplemental Cooling System (SCS) is a fully electrical system which supplies cooling to the galleys.

L3 The control of the SCS function is hosted in CPIOMs H43 and H44.

L1 The SCS has:

- Two cooling units that cool the fluid of the system.
  L2 The Vapor Cycle Refrigeration Unit (VCRU) cools the coolant who supplies the galleys.
- L1 One distribution unit that supplies this coolant to the galleys.
  L2 The Coolant Distribution Module (CDM) supplies the coolant to the galleys.

L1 If one cooling unit fails, the performance of the SCS will be degraded.
Provided that COOLG pb-sw is set to AUTO, the SCS operates as soon as the aircraft is electrically powered.

MAN

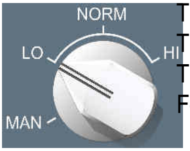
The airflow in the cabin/cockpit is automatically controlled.
The pack airflow is automatically controlled, depending on the number of passengers entered on the MFD, the aircraft flight level, and the temperature regulation of the forward cargo compartment ❄ on the CARGO AIR COND panel.
For additional information, *Refer to Flow Regulation / Automatic Mode*.

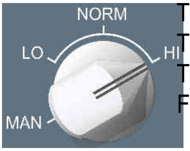
L12



NORM
LO
HI
MAN

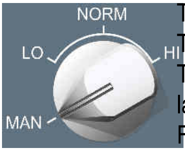
The airflow in the cabin/cockpit is in manual mode.
The pack airflow is reduced.
The pack airflow is 80 % of the MAN value.
For additional information, *Refer to Flow Regulation / Manual Mode*.

L12



The airflow in the cabin/cockpit is in manual mode.
The pack airflow is increased.
The pack airflow is equal to or more than 120 % of the MAN value.
For additional information, *Refer to Flow Regulation / Manual Mode*.

L123



The airflow in the cabin/cockpit is in manual mode.
The pack airflow is at a default value.
The default value corresponds to an airflow rate for a typical three–class cabin layout with all seats occupied.
For additional information, *Refer to Flow Regulation / Manual mode*.

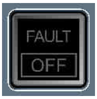
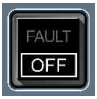
PACK 1(2) PB-SW

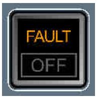


The pack is on, and automatically regulated.



The pack is off.

L12



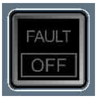
Comes on:

- When any pack valve position disagrees with the requested position, or
- When the pack overheats, or
  Associated with the following ECAM alert: AIR PACK 1(2) OVHT (*Refer to procedure*).
  The FAULT light goes off, when the overheat disappears.
- When the pack is failed, or

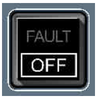
  Associated with one of the following ECAM alerts:
  - AIR PACK 1(2) FAULT (*Refer to procedure*), or
  - AIR PACK 1+2 FAULT (*Refer to procedure*).
- When there is a bleed leak on one pack.
  Associated with the following ECAM alert: AIR PACK 1(2) LEAK (*Refer to procedure*).

Ident.: DSC-21-COND-20-10-00001552.0001001 / 15 APR 14

HOT AIR 1(2) PB-SW

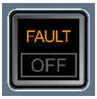


The hot-air valve operates, and is automatically-controlled.



The hot-air valve is closed.

L12



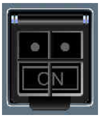
An overheat is detected in the applicable duct.

Associated with one of the following ECAM alerts:
- COND HOT AIR 1(2) FAULT (*Refer to procedure*), or
- COND DUCT OVHT (*Refer to procedure*).

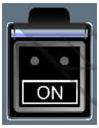
The FAULT light goes off, when the temperature decreases below 60 °C, and the HOT AIR 1(2) pb-sw is reset (set to OFF and then pressed again).

Ident.: DSC-21-COND-20-10-00001553.0001001 / 07 MAY 18

RAM AIR PB-SW



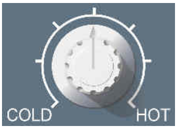
The ram air inlet is closed.



Comes on:
- When the differential pressure is less than 2 PSI, and provided the DITCHING pb-sw, on the CABIN PRESS panel, is not set to ON: The ram air inlet will open, and each outflow valve will open to approximately 50 %.
- If the differential pressure is more than, or equal to, 2 PSI: Each outflow valve will continue to operate normally. The ram air inlet will open but the check valve downstream of the emergency ram air inlet will not open. Therefore, no air will be supplied to the mixer unit.

Ident.: DSC-21-COND-20-10-00001554.0001001 / 01 JUN 16

COCKPIT SEL

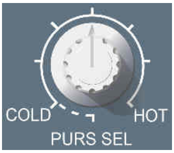


The cockpit temperature is 24 °C.
Each gradation corresponds to 2 °C.

Note: *Any selection change makes the system blow colder, or hotter air into the cockpit. This may result in temporary discomfort for the flight crew. To reach a stabilized temperature in the cockpit, the air conditioning system needs approximately 20 min: 10 min are necessary for cockpit temperature adjustment, and 10 min are necessary to compensate heat dissipation from the cockpit systems. After selecting a temperature value, wait until the cockpit temperature stabilizes, before selecting a new temperature.*

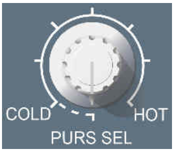
Ident.: DSC-21-COND-20-10-00001555.0001001 / 19 SEP 14

CABIN SEL



The cabin temperature is 24 °C.
Each gradation corresponds to 2 °C.

Note: *Any selection change makes the system blow colder, or hotter air into the cabin. This may result in temporary discomfort for the passengers. To reach a stabilized temperature in the cabin, the air conditioning system needs approximately 20 min: 10 min are necessary for cabin temperature adjustment, and 10 min are necessary to compensate heat dissipation from the cabin systems. After selecting a temperature value, wait until the cabin temperature stabilizes before selecting a new temperature.*



Cabin temperature regulation is only controlled from the Flight Attendant Panel (FAP).

OVERVIEW

Ident.: DSC-21-VENT-10-10-00001621.0001001 / 09 MAR 16
Applicable to: ALL

The aircraft has a fully automatic ventilation system for:
- The cockpit and cabin
- The Flight Crew Rest Compartment ◁ (FCRC)
- The Cabin Crew Rest Compartment ◁ (CCRC)
- The bulk cargo compartment
- The forward cargo compartment ◁
- The aft cargo compartment ◁
- The avionics bay
- The IFE and Connectivity center rack, and
- The pack bays.

L3 The ventilation control and monitoring is performed by the Ventilation Control System (VCS) application software which is hosted on CPIOMs H41 and H42. In normal operation, one CPIOM is active and the other one is in standby.

In addition, there are several pairs of CRDCs that:
- Gather and convert analog/discrete sensor signals to digital signal for transfer to the VCS via the avionics network.
- Send some analog/discrete signals for VCS directly to some aircraft systems, as backup in the case of VCS CPIOMs loss or avionics network failure.

Intentionally left blank

COCKPIT VENTILATION

Ident.: DSC-21-VENT-10-25-10-00019984.0001001 / 15 APR 14
Applicable to: ALL

The cockpit is automatically ventilated, with air from the mixer unit.
If necessary, the flight crew can manually force the cockpit ventilation.

In addition, each flight crew can locally increase the airflow, for the following purposes:
- Windshield defogging
- Lateral window defogging, and lateral individual ventilation
- Foot ventilation.

Ident.: DSC-21-VENT-10-25-10-00019985.0001001 / 30 JUL 15
Applicable to: ET-ATQ, ET-ATR

COCKPIT HI VENTILATION MODE

The flight crew can manually increase the airflow which supplies the cockpit.
On ground, the flight crew can also use the forced ventilation to defog the windshields and lateral windows.
The flight crew triggers the cockpit forced ventilation with the CKPT HI VENT pb-sw on the AIR panel.

L2 The cockpit HI VENT valve moves to the fully open position and all bypass valves, which supply the individual air outlets, are commended to fully open.

Ident.: DSC-21-VENT-10-25-10-00019986.0001001 / 15 APR 14
Applicable to: ALL

WINDSHIELD DEFOGGING

The flight crew can manually force the windshield defogging, with the WINDSHIELD DEFOG pb-sw on the AIR panel.

Ident.: DSC-21-VENT-10-25-10-00019987.0001001 / 15 APR 14
Applicable to: ALL

LATERAL WINDOW DEFOGGING AND LATERAL INDIVIDUAL VENTILATION

Each flight crew can manually adjust the airflow:
- To defog their onside lateral window, and
- To supply the lateral individual air outlet.

The airflow is adjusted with the LAT/VENT DEFOG selector on the onside CAPT(F/O) INDIVIDUAL VENT panel.
Each flight crew can increase the temperature of this airflow, with an electrical heater controlled from a dedicated switch on the onside CAPT(F/O) INDIVIDUAL VENT panel.

Ident.: DSC-21-VENT-10-25-10-00019988.0001001 / 15 APR 14
Applicable to: ALL

FOOT VENTILATION

Each flight crew can manually adjust the airflow which goes around the onside rudder pedals.
The airflow is adjusted with the FOOT VENT selector on the onside CAPT(F/O) INDIVIDUAL VENT panel.
Each flight crew can increase the temperature of this airflow, with an electrical heater controlled from a dedicated switch on the onside CAPT(F/O) INDIVIDUAL VENT panel.

CABIN AIR RECIRCULATION

Ident.: DSC-21-VENT-10-30-00001629.0001001 / 15 APR 14
Applicable to: ALL

There are four recirculation fans that recirculate cabin air to the mixer unit (*Refer to Mixer Unit*).

LAVATORY AND GALLEYS AIR EXTRACTION

Ident.: DSC-21-VENT-10-30-00001630.0001001 / 23 APR 14
Applicable to: ALL

In some cabin areas (e.g. lavatories, galleys) to avoid bad smells, air is extracted and then directly discharged overboard.

L3 On ground, or when the differential pressure is less than a precise value:
- The air is discharged overboard via the outflow valve
- The extraction fan operates
- The isolation valve is closed.

In flight, when the differential pressure is more than a precise value:
- The air is discharged directly overboard through an assigned air outlet, via differential pressure
- The extraction fan automatically stops
- The isolation valve automatically opens.

The air outlet is on the skin of the aft part of the aircraft.

L1 *Note:* *When the DITCHING pb-sw is set to ON, the isolation valve will close.*

AFT CARGO COMPARTMENT VENTILATION ⩤

Ident.: DSC-21-VENT-10-40-00016500.0001001 / 09 MAR 16
Applicable to: ALL

The aft cargo compartment is automatically ventilated, with air from the air-conditioning system.

L2 Air flows into the aft cargo compartment, via two cargo inlet isolation valves.
An extraction fan then extracts this air, via an outlet isolation valve, and discharges this air overboard through the outflow valve.

L1 If necessary (e.g. smoke is detected in the cargo area), it is possible to isolate the aft cargo compartment, via the AFT ISOL VALVES pb-sw on the CARGO AIR COND panel.

BULK CARGO COMPARTMENT VENTILATION

Ident.: DSC-21-VENT-10-45-00001635.0001001 / 29 NOV 18
Applicable to: ALL

The bulk cargo compartment is automatically ventilated.

L2 Some air from the cabin flows into the bulk cargo compartment via an inlet isolation valve.
An extraction fan then extracts air, via an outlet isolation valve, and discharges this air overboard through the outflow valve.

L1 Heating is possible for the bulk cargo (*Refer to Temperature and Flow Regulation*).
Two isolation valves (one inlet and one outlet) permit the isolation of the bulk cargo compartment.
Theses valves are manually controlled using the BULK ISOL VALVES pb-sw on the CARGO AIR COND panel (*Refer to CARGO AIR COND panel*).

System Description

AVIONICS VENTILATION DESCRIPTION

Applicable to: ALL

Ident.: DSC-21-VENT-10-60-10-10-00001622.0001001 / 04 MAY 16

AVIONICS VENTILATION

The avionics ventilation system cools the electrical and electronic equipment in the avionics bay and in the cockpit panels.
There are two avionics ventilation circuits: The left (L) and the right (R) circuit. Both the L and R circuits cool the cockpit panels, and the avionics bay.

The avionics ventilation system:
- Uses recirculated air from the cabin
- Cools the various cockpit panels and electronic equipment with the recirculated air, and
- Extracts the recirculated air.

L2 The recirculated air is discharged overboard, when the aircraft is on ground with engines not running.
If not, the recirculated air is blown into the bilge area.

L3 The batteries are ventilated during the flight by cabin air that is extracted and discharged overboard via differential pressure.

L2 BLOWING FANS

There are two blowing fans, that blow recirculated air from the cabin in the various cockpit panels and electronic equipment. Each avionics ventilation circuit has one blowing fan.

L3 For both avionics ventilation circuits, the air is first filtered, before it enters the blowing fan.

L2 Both blowing fans automatically operate when the aircraft is powered by electricity. The active CPIOM monitors and controls both blowing fans.

The air flow and temperature in both avionics ventilation circuits are monitored.

Ident.: DSC-21-VENT-10-60-10-10-00020481.0001001 / 09 MAR 16

AVIONICS GROUND COOLING UNIT ⋪

On ground, the avionics ground cooling system cools the air that is blown in the avionics bay and the cockpit panels. The ground cooling system has two units, one for each avionics ventilation circuit.
The two units operate independently.
When the GND COOLG AVNCS pb-sw is set to AUTO, the ground cooling system will activate automatically if the temperature of the air is too high, and the air conditioning is OFF.

L3 This occurs when air temperature is more than 27 °C.

L1 The avionics ground cooling system uses the same cooling circuits, as those used to provide supplemental cooling to the galley.

L3 Each cooling unit is controlled by its own controller.

Ident.: DSC-21-VENT-10-60-10-10-00001625.0001001 / 15 APR 14

L2 BACKUP VALVES

Each ventilation circuit has one backup valve.
If the blowing fans cannot correctly cool the avionics bay, the backup valve of the affected circuit automatically opens. This enables air from the air conditioning system, to cool the avionics systems.

L3 The backup valve opens if:

- The associated blowing fan fails
- The airflow in the ventilation circuit is not sufficient. For example: The associated filter is clogged.

L2 The air from the air conditioning system comes directly from the mixer unit.
The cabin and cockpit air conditioning and ventilation system continue to operate normally.

Ident.: DSC-21-VENT-10-60-10-10-00001626.0001001 / 15 APR 14

EXTRACTION FAN

Two extraction fans extract air from the avionic bay and cockpit panels, either through the inboard valve, or through the overboard valve.
The extraction fan operate, when the aircraft is electrically-powered. The extraction fan is monitored and controlled by the active CPIOM.

L2 The CPIOM of the ventilation control system also:

- Controls the display of an ECAM alert and/or a dispatch message when a failure is detected, and
- Displays the indications related to the avionics ventilation system on the COND SD page.

Ident.: DSC-21-VENT-10-60-10-10-00001627.0001001 / 15 APR 14

OVERBOARD VALVE

L3 Air is discharged overboard through the overboard valve by the extraction fan, or by differential pressure.

L1 The overboard valve opens:
- Automatically, on ground, with the engines not running.
- Manually, in flight, in the case of failure in the avionics ventilation, when the AVNCS EXTRACT pb-sw on the VENT panel is set to OVRD (For more information on this configuration, *Refer to Override Configuration* In such cases, the valve partially opens.

L3 The overboard valve partially opens, when its small flap opens.

Ident.: DSC-21-VENT-10-60-10-10-00016099.0001001 / 15 APR 14

INBOARD VALVE

When the overboard valve is closed, the inboard valve opens.

L3 Air is discharged overboard by the extraction fan through the inboard valve, then through the outflow valve.

L1 *Note:* *When the DITCHING pb-sw is set to ON, the overboard valve will close, regardless of the AVNCS EXTRACT pb-sw selection (Refer to Ditching).*

Abnormal Operations

OVERRIDE CONFIGURATION

Ident.: DSC-21-VENT-10-60-20-00001628.0001001 / 15 APR 14
Applicable to: ALL

In flight, when the AVNCS EXTRACT pb-sw on the VENT panel is set to OVRD:
- The overboard valve partially opens, and
- Air is extracted and discharged through the overboard valve and inboard valve.

The inboard valve remains open only if the extract fans are running.

L2 The ECAM requests the flight crew to set the AVNCS EXTRACT pb-sw to OVRD, when:
- The VENT AVNCS EXTRACT FAULT alert triggers on the ECAM (*Refer to procedure*)
- The VENT AVNCS OVBD VLV FAULT alert triggers on the ECAM (*Refer to procedure*)
- The SMOKE L(R) AVNCS SMOKE alert triggers on the ECAM (*Refer to procedure*).

COMMERCIAL EQUIPMENT VENTILATION

Ident.: DSC-21-VENT-10-65-00020896.0001001 / 09 MAR 16
Applicable to: ALL

The commercial equipment ventilation system provides cooling air to commercial equipment such as In-Flight Entertainment (IFE) center rack and Connectivity rack.

L2 It also maintains the air extraction from the Cabin Crew Rest Compartment ◁ (CCRC).

L1 Ambient air next to the rack is extracted and drawn through the rack inlet and a filter unit. Then, two extraction fans blow the air into the bilge area, in front of the aft outflow valve: This ensures that smoke contaminated air is not recirculated inside the fuselage.

L2 The two extraction fans are mounted in parallel branches. Only one fan is operating while the second fan is in stand-by.

Intentionally left blank

PACK BAY VENTILATION

Ident.: DSC-21-VENT-10-70-00001632.0001001 / 30 APR 14
Applicable to: ALL

A ventilation system cools the two pack bays, and is fully automatic.

L3 The pack bay areas are ventilated by external air.

- In flight, external air flows into each pack bay area, through an air inlet. Both air inlets are in the forward belly fairing.
- On ground, two blowing fans ventilate both pack bay areas. These blowing fans are pneumatically-operated.
  Bleed air, from any available bleed supply, flows through two supply valves and drives both fans.
  The ASCU controls the blowing fans.

Air is discharged overboard, through a grid on each side of the pack bay.

OVERVIEW

Ident.: DSC-21-PRESS-10-00001677.0001001 / 09 APR 14
Applicable to: ALL

In normal operation, the pressurization system is fully automatic. Cabin air pressure is regulated to provide maximum passenger comfort.
The cabin pressure regulation is performed via the automatic control of the outflow valves during all flight phases, from takeoff to landing.

L2 During cruise the cabin altitude is regulated to remain below 6 000 ft.

L1 If necessary, the flight crew can manually operate the pressurization system, by selecting a cabin altitude target, and/or a cabin vertical speed.

1 To regulate the cabin pressure the pressurization system has:
- Two identical, independent and automatic controllers
- One manual controller
- Two outflow valves.

L3 In automatic and manual mode the pressurization system :

- Prevent the positive and negative differential pressure from going too high.
- Prevent the cabin altitude from going too high.
  The two outflow valves close when the cabin altitude exceeds 14 000 ft in automatic mode and 15 000 ft in manual mode.

Note: However, if the cabin altitude exceeds 9 550 ft, the ECAM will trigger the CAB PRESS EXCESS CAB ALT ECAM alert on the WD.

Ident.: DSC-21-PRESS-10-10-00001679.0001001 / 24 APR 14

AUTOMATIC CONTROL MODE

In automatic mode (when the CABIN ALT MODE pb-sw and CABIN V/S MODE pb-sw are set to AUTO), one Outflow valve Control Unit (OCU) automatically controls the cabin altitude target, and the cabin vertical speed.
There are two OCUs. OCU1 computes the cabin pressure targets and provides corresponding commands to OCU2. Both OCUs drive their corresponding outflow valve, more open or closed, in order to reach the demanded pressure target. If one OCU fails the other one takes over the control of the two outflow valves.

L2 If the differential pressure exceeds the maximum limit of the electronic differential pressure protection, the master OCU is shut off and the remaining OCU takes over control to recover, and opens the two outflow valves. This limit is equal to 9.65 PSI.

L1 For more information on the normal operation of the pressurization system, *Refer to DSC-21-PRESS-30 Automatic Operation*.
In order to automatically control the cabin pressure, each OCU uses the FMS flight plan (including the landing elevation), together with current outside air pressure, and air conditioning system status.

Note: The landing elevation is necessary to be in automatic mode.

L2 The OCUs use an internal pressure sensor to determine the cabin altitude and cabin vertical speed.

Each OCU receives data from the following systems:

- The Flight Management System (FMS)

L3 The OCUs use the following data:

  - QNH at destination
  - Landing elevation
  - Remaining time to top of descent
  - Remaining time to destination.

L2 - The (ADIRS)

L3 The OCUs use the following data:

  - Corrected average static pressure
  - Barometric correction
  - Aircraft altitude
  - Calibrated Air Speed (CAS).

L2 - The landing gear

L3 The OCUs use the status of the landing gears (on ground position).

L2 - The engines

L3 The OCUs use the following data:

  - Engines running
  - Engines at takeoff power.

L2 - Air conditioning system

L3 The OCUs use the following data:

  - Status of each pack
  - Actual flow from each pack
  - Position of the Emergency Ram Air Inlet (ERAI).

L2 - The doors

L3 The OCUs use the door status (all doors closed, and latched).

L2 - The Ventilation Control System

L3 The OCUs use the following data:

  - Flow ratio
  - Position of the air extraction valve(s) in the cabin
  - Position of the avionics overboard valve.

Note: *For all system, data is received via the avionics network, and the CPIOMs H41 and H42.*

Ident.: DSC-21-PRESS-10-10-00015884.0001001 / 09 APR 14

MANUAL CONTROL MODE

If the automatic control system of the two OCUs fails, or in case of loss of the landing elevation, the flight crew can manually control the cabin pressure.

L2 In manual mode (when the CABIN ALT MODE pb-sw, or the CABIN V/S MODE pb-sw are set to MAN), the Semi-Automatic Control Unit (SACU) uses internal cabin pressure and differential pressure sensors, and the external pressure coming from the ISIS.

L1 Cabin vertical speed and/or cabin altitude target can be selected by the flight crew on the CABIN PRESS panel.

Refer to DSC-21-PRESS-40 Manual Operation

Ident.: DSC-21-PRESS-10-10-00001680.0001001 / 23 APR 14

OUTFLOW VALVES

There are two outflow valves:
- One is in the forward part of the aircraft
- One is in the aft part of the aircraft.

L2 The outflow valves are below the flotation line.

L1 The outflow valves control the cabin pressure, by regulating air outflow.

L2 Note: *When the RAM AIR pb is set to ON, both packs are off, and the differential pressure is less than 2 PSI, the system automatically opens the outflow valves to approximately 50 %, to ensure the ventilation of the cockpit and cabin.*

Ident.: DSC-21-PRESS-10-10-00001681.0001001 / 27 OCT 14

NEGATIVE RELIEF VALVE

The aircraft is equipped with one negative relief valve, that operates mechanically with differential pressure. The negative relief valve prevents the negative differential pressure from going too high. The negative relief valve is installed on the right side of the forward part of the aircraft, above the flotation line.

L3 The negative relief valve mechanically-opens, in order to not exceed the maximum negative differential pressure, which is equal to -0.725 PSI.

Ident.: DSC-21-PRESS-10-10-00001682.0001001 / 09 APR 14

OVERPRESSURE RELIEF VALVE

In the event that the pressurization system fails, one independent overpressure relief valve automatically prevents positive and negative cabin pressure from going too high.
This valve is located in the rear pressure bulkhead.

L3 The overpressure relief valve automatically opens when the differential pressure is below –0.725 PSI or above 10.29 PSI.

AUTOMATIC OPERATION

Applicable to: ALL

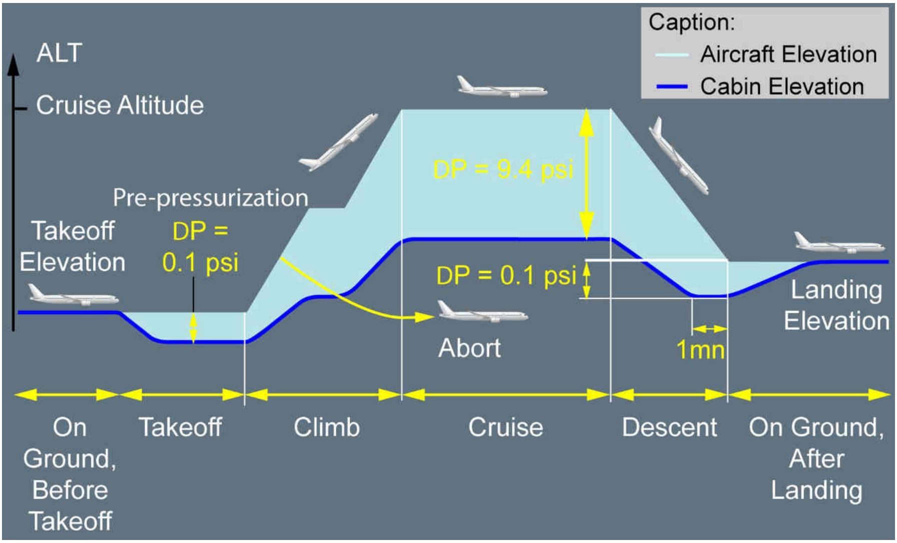
Ident.: DSC-21-PRESS-30-10-00001708.0001001 / 09 APR 14

When the cabin pressurization system is automatically controlled (CABIN ALT MODE pb-sw and CABIN V/S MODE pb-sw are both set to AUTO), the two Outflow valve Control Units (OCUs) operate to automatically control cabin air pressurization, as follows:

PRESSURIZATION FLIGHT PROFILE

Pressurization Flight Profile



ALT
Cruise Altitude
Caption:
Aircraft Elevation
Cabin Elevation
Pre-pressurization
Takeoff Elevation
DP = 0.1 psi
DP = 9.4 psi
DP = 0.1 psi
Abort
1mn
Landing Elevation
On Ground, Before Takeoff
Takeoff
Climb
Cruise
Descent
On Ground, After Landing

Ident.: DSC-21-PRESS-30-10-00001709.0001001 / 09 APR 14

ON GROUND, BEFORE TAKEOFF

Before takeoff, all outflow valves open, to ensure there is no differential pressure between the air inside the aircraft and the external air.

Ident.: DSC-21-PRESS-30-10-00001710.0001001 / 09 APR 14

TAKEOFF

During takeoff, the Cabin Pressure Control System (CPCS) pressurizes the aircraft to provide a smooth variation of the cabin vertical speed at liftoff.

The aircraft is pressurized at a rate of –300 ft/min: This ensures a differential pressure of 0.1 PSI at liftoff.

L12

Note: *On ground, if at least one door is not closed and locked at takeoff power application, the two OCUs will prevent the cabin from pressurization by maintaining the two outflow valves open.*
Associated with the following ECAM alert: CAB PRESS INHIBITED BY DOORS (Refer to procedure).

L3 PRESSURIZATION TAKEOFF PHASE

The pressurization takeoff phase occurs, when:
- All doors are closed and latched
- The main landing gear is compressed
- Engines are at takeoff power.

Ident.: DSC-21-PRESS-30-10-00001711.0001001 / 09 APR 14

CLIMB

During climb, the cabin vertical speed is determined to reach the scheduled cabin altitude at the top of climb defined by the FMS cruise level.
L2 The cabin vertical speed is limited to +400 ft/min.

L3 PRESSURIZATION CLIMB PHASE

The pressurization climb phase stars from the liftoff when the main landing gear is no longer compressed.

Ident.: DSC-21-PRESS-30-10-00001712.0001001 / 09 APR 14

CRUISE

During cruise, the cabin altitude is regulated not to exceed 6 000 ft.
L2 This corresponds to a differential pressure of approximately 9.4 PSI between the cabin altitude and the aircraft altitude.

Ident.: DSC-21-PRESS-30-10-00001713.0001001 / 02 MAY 14

DESCENT

During descent, the cabin vertical speed is controlled, to ensure that the cabin altitude reaches an altitude slightly below the landing elevation prior to landing.
L2 The cabin pressure reaches the landing field pressure +0.1 PSI.
This ensures that the aircraft is still pressurized at landing, and provides a smooth variation in cabin altitude if a go-around is performed.
When the aircraft is above 25 000 ft, the cabin vertical speed is limited to -250 ft/min. When the aircraft is below 25 000 ft, the cabin vertical speed is limited to -300 ft/min.

L3

PRESSURIZATION DESCENT PHASE

The pressurization descent phase occurs:
- Less than 1 min before top of descent if AP and NAV mode are engaged
- 1 000 ft below the cruise altitude if AP or NAV mode is not engaged.

Ident.: DSC-21-PRESS-30-10-00001714.0001001 / 09 APR 14

ON GROUND, AFTER LANDING

At touchdown, all outflow valves open, to remove the residual differential pressure.

L3 Residual differential pressure removal takes less than 90 s.

PRESSURIZATION GROUND PHASE

The pressurization ground phase occurs, when the aircraft touches down (main landing gear compressed).

Ident.: DSC-21-PRESS-30-10-00001715.0001001 / 23 APR 14

L2

ABORT

If the aircraft does not climb after takeoff, the cabin altitude will automatically stop climbing.
The cabin pressure is set back to the takeoff altitude pressure as soon as the aircraft lifts off.

L3

PRESSURIZATION ABORT PHASE

The pressurization abort phase occurs, when:
- The aircraft is at takeoff phase or climb phase
- The aircraft altitude is less than 5 000 ft above the aircraft altitude at takeoff
- The aircraft vertical speed is less than +250 ft/minfor 30 s.

Ident.: DSC-21-PRESS-30-10-00020941.0001001 / 06 MAY 14

L2

HIGH ALTITUDE AIRPORT

During the climb phase, after a takeoff from a high altitude airport, the cabin altitude decreases in order to reach the scheduled cabin altitude.
During the descent phase, before a landing at a high altitude airport, the cabin altitude increases in order to reach an altitude slightly below the landing elevation. At touchdown, all outflow valves open, to remove the residual differential pressure.

MANUAL OPERATION

Ident.: DSC-21-PRESS-40-00001717.0001001 / 09 APR 14
Applicable to: ALL

If the automatic pressurization system fails, the flight crew can control the cabin pressure, by using the manual pressurization system.
The manual pressurization system operates independently of the automatic pressurization system.
L2 To obtain the desired cabin altitude and vertical speed, the manual pressurization system uses external pressure from the ISIS, as well as cabin pressure.

L1 There are two manual pressurization modes that can be combined:
- The cabin altitude manual pressurization mode, when activating the CABIN ALT MODE pb-sw to MAN
- The vertical speed manual pressurization mode, when activating the CABIN V/S MODE pb-sw to MAN.

When manual pressurization mode is activated, if no altitude or cabin vertical speed is selected on the CAB ALT TRGT selector or the V/S TRGT selector:
- The cabin altitude remains steady, and
- The cabin vertical speed is set at 0 ft/min.

CABIN ALTITUDE TARGET MANUAL PRESSURIZATION MODE

The flight crew selects the cabin altitude target on the CAB ALT TRGT selector.

If the vertical speed manual pressurization mode is not activated, the default vertical speed is:
- In descent: -300 ft/min
- In climb: +500 ft/min.

CABIN VERTICAL SPEED MANUAL PRESSURIZATION MODE

If the cabin vertical speed is selected on the CAB V/S TRGT selector (between -1 500 ft/min and +2 500 ft/min), the cabin altitude will change in accordance with the selected vertical speed, until the cabin altitude target is reached.

Note: The cabin altitude selection has priority over the vertical speed selection.

DITCHING

Ident.: DSC-21-PRESS-40-00001718.0001001 / 03 JUL 20
Applicable to: ALL

1 To prepare for ditching, the flight crew sets the guarded DITCHING pb-sw, on the CABIN PRESS panel, to ON. This closes all the valves, inlets and outlets located below the flotation line.

L2 These valves, inlets and outlets are:

- The two outflow valves
- The avionics overboard valve
- All the cargo isolation valves
- The two pack valves
- The pack ram air inlet and outlet
- The emergency ram air inlet.

ABNORMAL CABIN ALTITUDE INCREASE IN CLIMB DUE TO OFV ERRONEOUSLY OPEN

Ident.: DSC-21-PRESS-45-00024946.0001001 / 03 JAN 19
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYB

DESCRIPTION

In climb, an outflow valve may be abnormally in the fully open position without detection by the Cabin Pressure Control System (CPCS). The affected OFV is indicated as fully open in green on the CAB PRESS SD page. This is due to a specific failure mode of the automatic CPCS.

As a result, the effects in the cockpit are all of the following:
- The cabin altitude increases quickly, as indicated on the CAB PRESS SD page or CRUISE page (with a CAB V/S at almost the same V/S as the aircraft)
- After liftoff, when the CAB V/S reaches +1 800 ft/min, the cabin V/S needle and digital indication pulse in green on the CAB PRESS SD page
- When the CAB ALT reaches 8 300 ft, both the cabin altitude needle and digital indication pulse in green on the CAB PRESS SD page. For high altitude airports (with airport altitude above 8 000 ft), this ECAM advisory is triggered if aircraft altitude is above 25 000 ft
- When the CAB ALT reaches 9 550 ft, the CAB PRESS EXCESS CAB ALT alert is triggered on the WD. For high altitude airports, this alert is triggered on the WD when the cabin altitude reaches runway elevation +1 000 ft.

The flight crew should consider the below procedure to prevent the triggering of the CAB PRESS EXCESS CAB ALT alert and a possible abortion of the mission.

PROCEDURE

In climb, if the CAB ALT or CAB V/S ECAM advisory pulses, the flight crew should consider a CAB PRESS CTL MODE RESET (*Refer to [RESET] CAB PRESS Reset Table*).

L2 The flight crew can also access the reset procedure via the FCOM [ADV] ECAM ADVISORY (*Refer to PRO-ABN-ABN-ADV CAB PRESS Advisories*).

Intentionally left blank

GENERAL

Ident.: DSC-22-27-10-10-00014840.0001001 / 24 APR 14
Applicable to: ALL

The following reference speeds are used to compute the operating speeds:
- VS1G
- VMCG
- VMCA
- VMCL
- VMU
- VD/MD
- VRA/MRA
- VREF.

VS1G

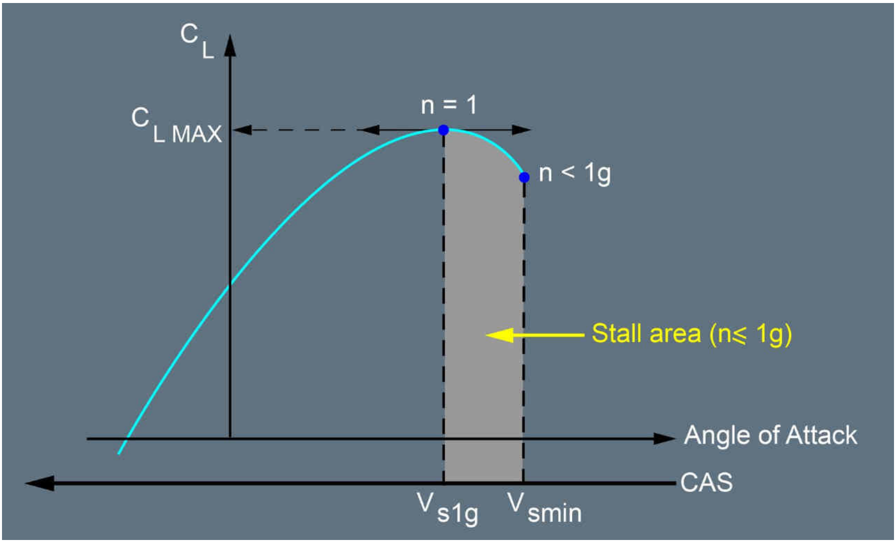
Ident.: DSC-22-27-10-10-00001735.0001001 / 04 DEC 14
Applicable to: ALL

DEFINITION

VS1G is the stall speed of the aircraft with a load factor of 1 g, at idle thrust.
VS1G is the reference speed used for the computation of the operating speeds (VLS, S, F, VREF).

L3 On a conventional aircraft, the reference stall speed, VSMIN, corresponds to a conventional stall (i.e. when lift suddenly collapses). At the moment of a conventional stall, the load factor is always below 1 g. As a consequence, VSMIN is below VS1G.

VS1G



Thanks to the high angle of attack protection (that the flight crew cannot override), the Airworthiness Authorities have reconsidered the definition of stall speed. As a consequence, VSMIN = 0.94 * VS1G.

L1 DISPLAY

VS1G is not displayed in the cockpit.

L2 COMPUTATION

The PRIMs compute VS1G.

VS1G depends on:
- The position of the slats and flaps
- The aircraft weight and CG
- The aircraft altitude
- The position of the landing gear.

The FMS also computes the VS1G, for performance predictions, and characteristic speeds computation.

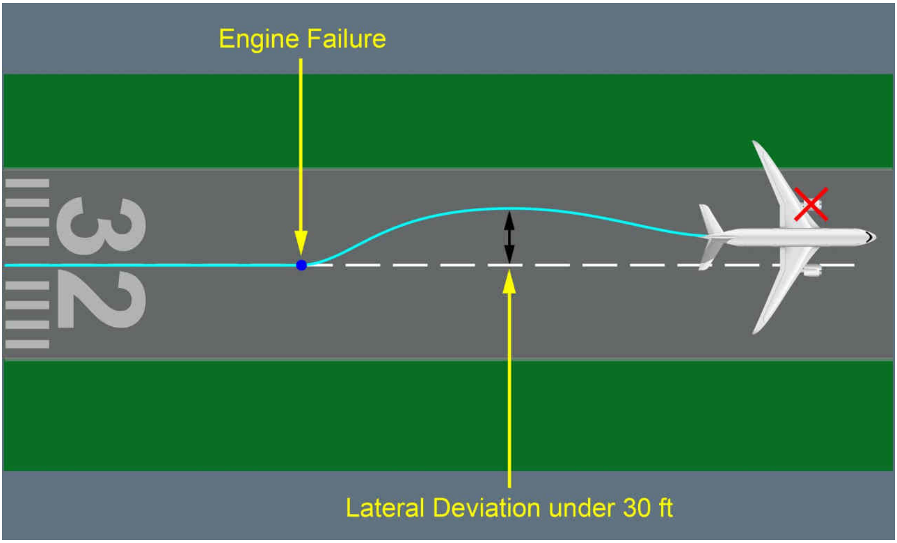
VMCG

Ident.: DSC-22-27-10-10-00001744.0001001 / 06 MAY 15
Applicable to: ALL

DEFINITION

VMCG is the minimum speed on ground during takeoff at which the use of only the primary flight controls permits to control the aircraft, after a sudden failure of one engine with the other engine at takeoff thrust.
During the recovery maneuver, the path of the aircraft must not deviate from the runway centerline by more than 30 ft.

VMCG



DISPLAY

VMCG is not displayed in the cockpit.

L2 COMPUTATION

VMCG is not computed.
VMCG is determined during flight tests.
VMCG is used for takeoff speed computation.
Refer to LIM-AG-SPD Minimum Control Speeds

VMCA

Ident.: DSC-22-27-10-10-00001745.0001001 / 06 MAY 15
Applicable to: ALL

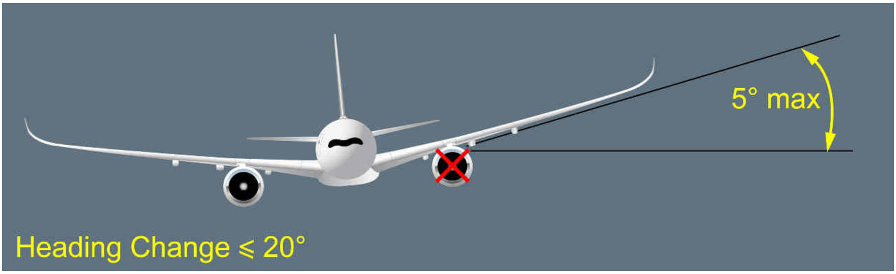
DEFINITION

VMCA is the minimum speed in flight at which the aircraft can be controlled with a maximum bank angle of 5 °, after a sudden failure of one engine with:

- The other engine at takeoff power
- The landing gear up
- The slats and flaps in the takeoff configuration.

During the recovery maneuver, the heading change must not exceed 20 °.

VMCA



DISPLAY

VMCA is not displayed in the cockpit.

L2 COMPUTATION

VMCA is not computed.
VMCA is determined during flight tests.
VMCA is used for takeoff speed computation.
Refer to LIM-AG-SPD Minimum Control Speeds

VMCL

Ident.: DSC-22-27-10-10-00001746.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VMCL is the minimum speed in flight, at which the aircraft can be controlled with a maximum bank angle of 5 °, after a sudden failure of one engine with:
- The other engine at go-around power
- The landing gear up
- The slats and flaps in the approach configuration.

DISPLAY

VMCL is not displayed in the cockpit.
However, VMCL limits VLS.

L2 COMPUTATION

VMCL is not computed.
VMCL is determined during flight tests.
Refer to LIM-AG-SPD Minimum Control Speeds

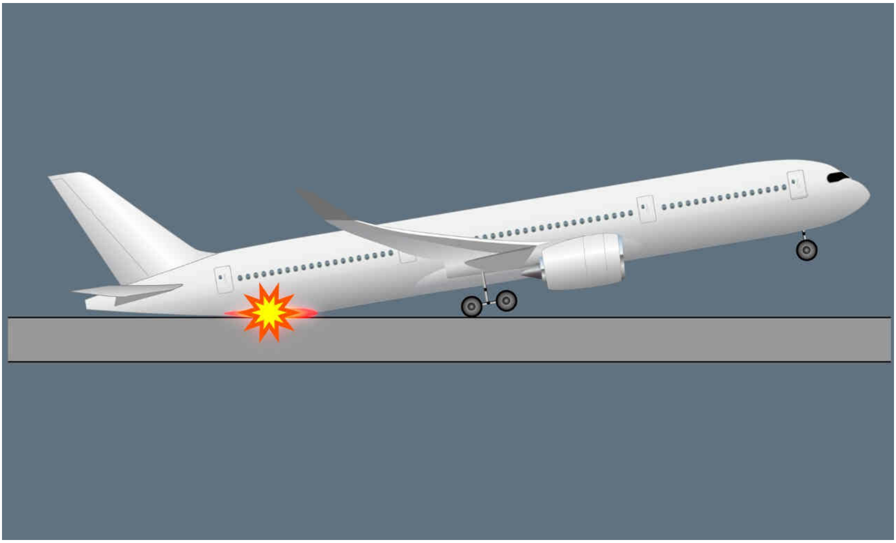
VMU

Ident.: DSC-22-27-10-10-00001748.0001001 / 08 JUL 19
Applicable to: ALL

DEFINITION

VMU is the minimum speed at which the aircraft can safely lift off and continue the takeoff.
A takeoff at a speed below VMU may result in a tail strike.

VMU



L3 To demonstrate VMU during flight tests, at low speed, the pilot maintains full back stick until the tail touches the ground. This pitch attitude is maintained until the aircraft lifts off.

L1 DISPLAY

VMU is not displayed in the cockpit.

L2 COMPUTATION

VMU is not computed. It is determined during flight tests.
VMU is used for takeoff speed computation.

VD/MD

Ident.: DSC-22-27-10-10-00014842.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VD/MD is the maximum structural speed of the aircraft.

DISPLAY

VD/MD is not displayed.

L2 COMPUTATION

VD/MD is not computed. It is determined during flight tests.

VRA/MRA

Ident.: DSC-22-27-10-10-00014843.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VRA/MRA is the recommended turbulence penetration airspeed.

DISPLAY

VRA/MRA is not displayed in the cockpit.
The FMS displays the maximum turbulence penetration speed in the MAX TURB field on the CRZ panel of the FMS PERF page.(*Refer to DSC-22-FMS-20-20-20 PERF Page*). The maximum turbulence speed is above VRA/MRA.

L2 COMPUTATION

VRA/MRA is not computed.

VREF

Ident.: DSC-22-27-10-10-00001755.0001001 / 02 OCT 14
Applicable to: ALL

DEFINITION

VREF is used to compute the landing performance with failure(s).

DISPLAY

VREF is not displayed on the PFD.
VREF is displayed on the APPR panel of the FMS PERF page. (*Refer to DSC-22-FMS-20-20-20 PERF Page*)

L2 COMPUTATION

VREF is equal to the VLS of CONF FULL.

Intentionally left blank

GENERAL

Ident.: DSC-22-27-10-20-00014841.0001001 / 24 APR 14
Applicable to: ALL

The following operating speeds are displayed in the cockpit on the airspeed scale of the PFD or on the MFD:
- VLS
- GREEN DOT
- F
- S
- VFE
- VFE NEXT
- V1
- VR
- V2
- VAPP
- VMO/ MMO
- VMAX
- $V\alpha_{prot}$
- $V\alpha_{max}$
- $V\alpha_{sw}$
- VLE/MLE
- VLO/MLO.

In addition, the following speeds are displayed on the speeds placard in the cockpit:
- VFE
- VLE/MLE
- VLO/MLO.

VLS

Ident.: DSC-22-27-10-20-00001736.0001001 / 06 MAY 15
Applicable to: ALL

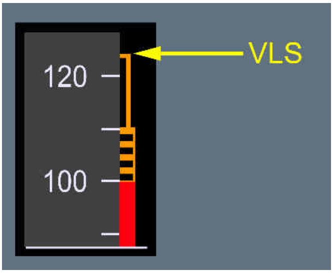
DEFINITION

VLS is the lowest selectable speed.
If the flight crew inadvertently set a speed below VLS, the auto-thrust limits the speed to VLS.
VLS provides a margin against stall at low speeds, and toward buffet at high Mach number.

DISPLAY

VLS is displayed on the airspeed scale on the PFD.

VLS



VLS is displayed in flight only.

L3 VLS appears three seconds after liftoff and disappears at touchdown.

L1 *Note:* *The FMS also computes the VLS. It is displayed on the APPR panel of the FMS PERF page (Refer to DSC-22-FMS-20-20-20 PERF Page).*

L2 COMPUTATION

The PRIMs compute the VLS displayed on the PFD.

VLS depends on:
- Vs1g
- The flight phase (takeoff, after slats/flaps retraction, cruise, landing or go-around)
- The position of the speed brakes.

DURING TAKEOFF

VLS is the highest of:
- 1.13 * Vs1g, or
- The minimum of V2/1.05 and 1.05 * VMCA

DURING ALL OTHER FLIGHT PHASES

As soon as the flaps configuration changes (crew action on lever or activation of the ARS), the computation of the VLS becomes the following:

- In CONF 1, after flaps auto retraction, VLS is the highest of:
  - 1.18 * Vs1g
  - VMCL
- In all other configurations, VLS is the highest of:
  - 1.23 * Vs1g

    Note: *Between 1.19 * Vs1g and 1.26 * Vs1g with slats or flaps jammed or failed depending on the slats/flaps configuration.*
  - VMCL

SPEED BRAKE EFFECT

When the speed brakes are extended, VLS increases.
This increase is a function of the slats/flaps configuration and the speed brakes extension.
For full speed brakes extension, the following is added to VLS:

CONF	VLS increase
0	Between 0 kt and 34 kt depending on weight and altitude
1	27 kt
1+F	Between 26 kt and 32 kt depending on altitude
2	Between 26 kt and 32 kt depending on altitude
3	Between 17 kt and 21 kt depending on altitude
3+S	Between 16 kt and 20 kt depending on altitude
FULL	16 kt

For speed brakes extension between 0 and FULL, the VLS increase is determined by linear interpolation.
In the case of failure of one or more pairs of spoilers, the VLS increase is limited in accordance with the number of spoilers that remains operative.

GREEN DOT

Ident.: DSC-22-27-10-20-00001737.0001001 / 24 APR 14
Applicable to: ALL

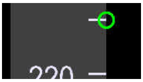
DEFINITION

Green dot is an optimized speed. It is an approximation of the best lift to drag ratio.
Flying at green dot speed provides the best climb gradient.

Green dot is:
- The final takeoff speed
- The managed speed target speed, in CONF 0, when the approach phase of the FMS is active
- The drift down speed, in the case of an engine failure.

DISPLAY

Green dot speed is displayed on the airspeed scale of the PFD.



Green dot speed is displayed in flight, when the FLAPS lever is at 0.

Note: The FMS also computes the green dot speed. It is displayed on the T.O, APPR, and GA panels of the FMS PERF page (Refer to DSC-22-FMS-20-20-20 PERF Page).

L2 COMPUTATION

The PRIMs compute Green dot speed:

Green dot depends on:
- The aircraft altitude
- The aircraft gross weight.

F

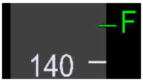
Ident.: DSC-22-27-10-20-00001739.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

F is:
- At takeoff or go-around: The minimum recommended speed at which the flaps can be retracted from CONF 2, CONF 3 to CONF 1+F
- During approach: The managed speed target, when in CONF 2 or CONF 3.

DISPLAY

F is displayed on the airspeed scale of the PFD.



F is displayed in flight, when the FLAPS lever is at 2 or 3.

L3 If the takeoff is performed in CONF 2 or CONF 3, F appears three seconds after liftoff.

L1 *Note:* *The FMS also computes F. It is displayed on the T.O, APPR, and GA panels of the FMS PERF page (Refer to DSC-22-FMS-20-20-20 PERF Page).*

L2 COMPUTATION

The PRIMs compute F:.

AT TAKEOFF

$F = \max(1.18 * Vs1g_{CONF\ 1+F}; VMCL + 5\ kt)$

IN APPROACH IN CONF 2

$F = 1.38 * Vs1g_{CONF\ 2}$ with the following limits:

- $F_{min} = VMCL + 15\ kt$
- $F_{max} = VFE_{CONF3} - 5\ kt$

IN APPROACH IN CONF 3

$F = 1.32 * Vs1g_{CONF\ 3}$ with the following limits:

- Fmin = VMCL +10 kt
- $Fmax = VFE_{CONF\ FULL} - 5\ kt$

S

Ident.: DSC-22-27-10-20-00001738.0001001 / 24 APR 14
Applicable to: ALL

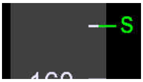
DEFINITION

S is:

- At takeoff or go-around: The minimum recommended speed at which the slats and flaps can be retracted from CONF 1+F or CONF 1 to CONF 0
- During approach: The managed speed target, when in CONF 1 or CONF 1+F.

DISPLAY

S is displayed on the airspeed scale of the PFD.



S is displayed in flight, when the FLAPS lever is at 1.

L3 If the takeoff is performed in CONF 1+F, S appears three seconds after liftoff.

L1 *Note:* *The FMS also computes S. It is displayed on the T.O, APPR, and GA panels of the FMS PERF page (Refer to DSC-22-FMS-20-20-20 PERF Page).*

L2 **COMPUTATION**

The PRIMs compute S.

AT TAKEOFF

$S = 1.21 * Vs1g_{\text{CONF } 0}$

IN APPROACH

$S = 1.21*Vs1g_{\text{CONF } 0}$ with the following limits:

- $S_{\text{min}} = \text{VMCL} + 20$ kt
- $S_{\text{max}} = \text{VFE}_{\text{CONF } 2} - 5$ kt

VFE

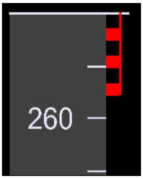
Ident.: DSC-22-27-10-20-00001749.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VFE is the maximum speed with the slats or flaps extended.
There is one VFE per configuration.
Refer to LIM-AG-SPD Maximum Flaps/Slats Speeds

DISPLAY

The VFE is displayed on the airspeed scale of the PFD.



The VFE for each slats/flaps configuration is also displayed on the speeds placard in the cockpit.

L2 The display of the VFE is based on:
- The actual position of the slats and flaps during retraction
- The position of the FLAPS lever during extension

When the slats or flaps are jammed, the display of the VFE is based on the actual position of the slats and flaps. The VFE that corresponds to the abnormal configuration is also displayed on the ECAM.

COMPUTATION

The VFEs are not computed. They are included in the PRIMs.

Note: *The overspeed warning is independent of the display of the VFE.*
When all PRIMs are failed, the VFE is not displayed, but the overspeed warning remains available.

VFE NEXT

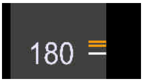
Ident.: DSC-22-27-10-20-00001750.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VFE NEXT is the VFE of the next more extended configuration.
The aim of VFE NEXT is to remind the flight crew the maximum speed at which they can extend the next configuration during approach.

DISPLAY

VFE NEXT is displayed on the airspeed scale of the PFD.



VFE NEXT is displayed in flight, below 20 000 ft.
L2 When the slats or flaps are jammed, the display of the VFE NEXT is based on the actual position of the slats and flaps.

COMPUTATION

VFE NEXT is not computed. It is included in the PRIMs.

V1

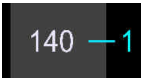
Ident.: DSC-22-27-10-20-00001752.0001001 / 24 APR 14
Applicable to: ALL

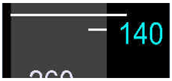
DEFINITION

V1 is the maximum speed at which the crew can decide to reject the takeoff, and is ensured to stop the aircraft within the limits of the runway.

DISPLAY

V1 is displayed on the airspeed scale of the PFD .





If V1 is outside of the visible airspeed scale, its value is displayed at the top of the airspeed scale.

An auto call-out announces when the speed reaches V1.

V1 (Synthetic Voice)

L2 COMPUTATION

V1 is not computed by the aircraft systems.
The crew inserts V1 on the T.O panel of the FMS PERF page.(*Refer to DSC-22-FMS-20-20-20 PERF Page*)

VR

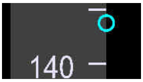
Ident.: DSC-22-27-10-20-00001753.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VR is the speed at which the pilot rotates in order to reach V2 before a height of 35 ft.

DISPLAY

VR is displayed on the airspeed scale of the PFD. It is represented by a blue dot.



L2 COMPUTATION

VR is not computed by the aircraft systems.
The crew inserts VR on the T.O panel of the FMS PERF page (*Refer to DSC-22-FMS-20-20-20 PERF Page*).

V2

Ident.: DSC-22-27-10-20-00001754.0001001 / 24 APR 14
Applicable to: ALL

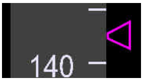
DEFINITION

V2 is the takeoff safety speed.

L2 V2 is determined in order to:
- Be reached before 35 ft, after rotation at VR, in the case of an engine failure
- Ensure a minimum climb gradient during the second segment
- Ensure a sufficient margin toward stall and VMCA. V2 must be above
  - 1.13 * Vs1g
  - 1.10 * VMCA

L1 DISPLAY

V2 is displayed on the airspeed scale of the PFD.



L2 COMPUTATION

V2 is not computed by the aircraft systems.
The flight crew inserts V2 on the T.O panel of the FMS PERF page (*Refer to DSC-22-FMS-20-20-20 PERF Page*).

VAPP

Ident.: DSC-22-27-10-20-00001756.0001001 / 03 DEC 15
Applicable to: ALL

DEFINITION

VAPP is the final approach speed.

DISPLAY

VAPP is not displayed on the PFD.
The VAPP is displayed on the APPR panel of the FMS PERF page. (*Refer to DSC-22-FMS-20-20-20 PERF Page*)

L2 The flight crew can update the VAPP on the APPR panel of the FMS PERF page.
The PRIMs use VAPP for the determination of the managed speed target during the approach. For more information, *Refer to DSC-22-FG-60-20 Introduction*.

COMPUTATION

The FMS computes VAPP.
$VAPP = VLS_{\text{Landing Conf}} + (5 \leq \text{Wind Correction} \leq 15)$

Note: *The Wind Correction is usually 1/3 of the Tower Headwind.*
However, at low landing weight (below 160 t (353 klb)), when VMCL limits VLS, the wind correction may be less than 1/3 of the Tower Headwind.

Note: The VAPP minimum value is VMCL + 5 kt

L3 In the FMS, the VAPP is calculated as the maximum of:
- VMCL + 5 kt
- 1.23*VS1G + (5 ≤ headwind/3 ≤ 15)

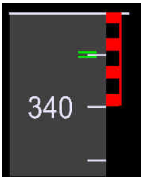
VMO/MMO

Ident.: DSC-22-27-10-20-00001751.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VMO/MMO is the maximum speed in clean configuration.

DISPLAY



L2 COMPUTATION

The ADIRUs compute VMO/MMO.
VMO/MMO is sent to the PRIMs for display.
L3 There is a backup link between the ADIRUs and the CDS, to enable VMO/MMO display when all PRIMs fail.

L2 VMO/MMO is the minimum of:
- VMO
- MMO converted into CAS.

Refer to LIM-AG-SPD Maximum Operating Speed VMO/MMO

VMAX

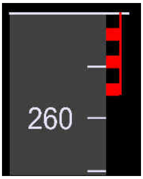
1 Ident.: DSC-22-27-10-20-00001743.0002001 / 03 JUL 20
Applicable to: ALL

DEFINITION

VMAX is the maximum permitted speed.

DISPLAY

VMAX is displayed on the airspeed scale of the PFD.



VMAX is displayed in flight.

L3 VMAX appears one second after liftoff and disappears at touchdown.

L2 COMPUTATION

The PRIM compute VMAX.

VMAX is equal to:

- In clean configuration, with landing gear up :	VMO/MMO *Refer to LIM-AG-SPD Maximum Operating Speed VMO/MMO* *Note:* *The display of the VMAX does not take into account the maximum speed displayed on the ECAM, if any (for example in direct law).*
- In clean configuration, with landing gear down :	VLE/MLE *Refer to LIM-AG-SPD Maximum Speeds with the Landing Gear Extended*
- In high lift configuration, with landing gear up :	VFE *Refer to LIM-AG-SPD Maximum Flaps/Slats Speeds*
- In high lift configuration, with landing gear down :	min (VFE , VLE/MLE)

When all PRIMs are failed, VMAX is equal to VMO/MMO, whatever the aircraft configuration (landing gear or slats/flaps).

V ALPHA PROT

Ident.: DSC-22-27-10-20-00001740.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

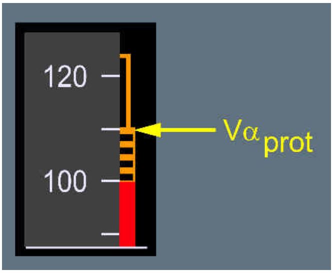
$V\alpha_{prot}$ is the speed at which the angle of attack is α_{prot}.
α_{prot} is the angle of attack at which the angle of attack protection becomes active.
For more information: *Refer to DSC-22-27-20 High Angle of Attack Protection*.

Note: *In the case of dynamic maneuvers, the angle of attack protection may be active at a speed above $V\alpha_{prot}$.*

DISPLAY

$V\alpha_{prot}$ is displayed on the airspeed scale of the PFD.

VαProt



$V\alpha_{prot}$ is displayed in flight, in normal law.

L3 $V\alpha_{prot}$ appears three seconds after liftoff and disappears at touchdown.

L2 COMPUTATION

The PRIMs compute $V\alpha_{prot}$.

$V\alpha_{prot}$varies with:
- The aircraft weight
- The altitude
- The Mach
- The slats/flaps configuration
- The position of the speedbrakes.

V ALPHA MAX

Ident.: DSC-22-27-10-20-00001741.0001001 / 24 APR 14
Applicable to: ALL

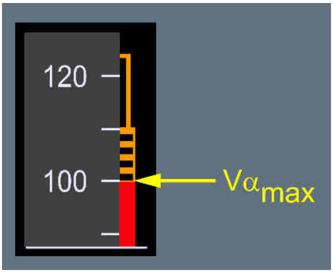
DEFINITION

$V\alpha_{max}$ is the speed at which the angle of attack is α_{max}.
α_{max} is the maximum angle of attack that the aircraft can reach in normal law.

DISPLAY

$V\alpha_{max}$ is displayed on the airspeed scale of the PFD.

Vαmax



$V\alpha_{max}$ is displayed in flight, in normal law.

L3 $V\alpha_{max}$ appears three seconds after liftoff and disappears at touchdown.

L2 COMPUTATION

The PRIMs compute $V\alpha_{max}$.

$V\alpha_{max}$ varies with:
- The aircraft weight
- The altitude
- The Mach
- The slats/flaps configuration
- The position of the speedbrakes.

V ALPHA SW

Ident.: DSC-22-27-10-20-00001742.0001001 / 24 APR 14
Applicable to: ALL

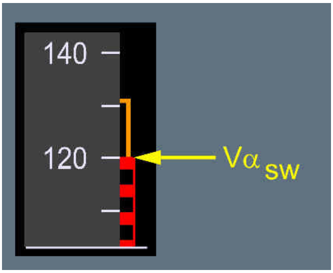
DEFINITION

$V\alpha_{sw}$ is the speed at which the angle of attack is α_{sw}.
α_{sw} is the angle of attack at which the stall warning is triggered.

DISPLAY

$V\alpha_{sw}$ is displayed on the airspeed scale of the PFD.

Vαsw



$V\alpha_{sw}$ is displayed in flight, in alternate or direct law.

L3 $V\alpha_{sw}$ appears three seconds after liftoff and disappears at touchdown.

L1 An audio warning announces the stall.

Stall (Sound and Synthetic Voice)

L2 COMPUTATION

The PRIMs compute $V\alpha_{sw}$.

$V\alpha_{sw}$ varies with:
- The aircraft weight
- The altitude
- The Mach
- The slats/flaps configuration
- The position of the speedbrakes.

Note: *The FWS computes the stall warning, independently of the computation of $V\alpha_{sw}$. If all PRIMs fail, $V\alpha_{sw}$ is lost, but the stall warning remains available.*

VLE/MLE

Ident.: DSC-22-27-10-20-00014844.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VLE/MLE is the maximum speed at which the aircraft can fly with the landing gear extended.

DISPLAY

VLE/MLE is not displayed on the PFD.
VLE/MLE is available on the speeds placard in the cockpit.

L2 COMPUTATION

VLE/MLE is not computed.
Refer to LIM-AG-SPD Maximum Speeds with the Landing Gear Extended

VLO/MLO

Ident.: DSC-22-27-10-20-00014845.0001001 / 24 APR 14
Applicable to: ALL

DEFINITION

VLO/MLO is the maximum speed to operate the landing gear.

DISPLAY

VLO/MLO is not displayed on the PFD.
VLO/MLO is available on the speeds placard in the cockpit.

L2 COMPUTATION

VLO/MLO is not computed.
Refer to LIM-AG-SPD Maximum Speeds with the Landing Gear Extended

Intentionally left blank

GENERAL

Ident.: DSC-22-27-20-00001757.0001001 / 24 APR 14
Applicable to: ALL

The protected flight envelope defines the maximum attitude parameters that the aircraft can achieve in normal law.
The AP/FD is available up to the limits of the protected flight envelope. However, when a protection activates (i.e. when the aircraft is out of the normal flight envelope) while the AP is engaged, the protection takes over to control the aircraft and the AP IN PROT message appears on the FMA.

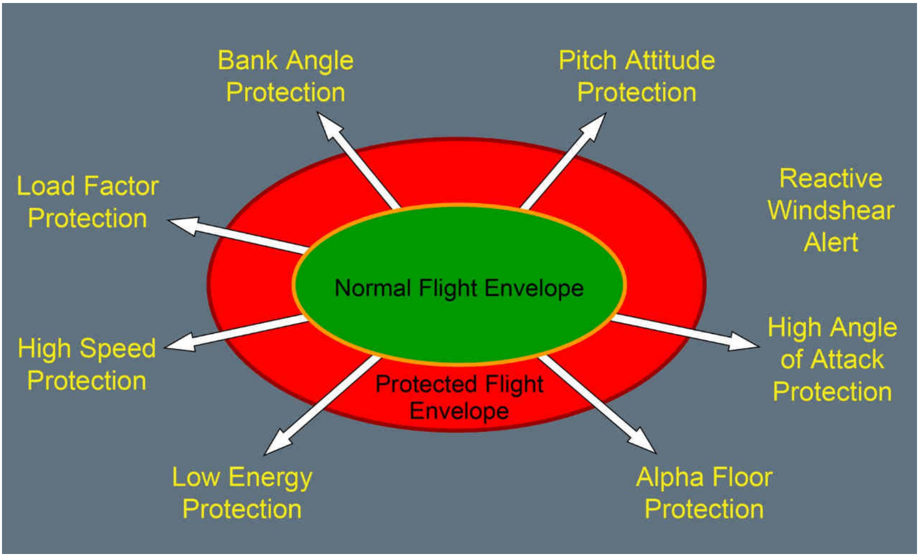
In order to prevent aircraft operation close to the limits of the protected flight envelope and maintain the aircraft in a normal flight envelope, the flight control laws provide protections in order to:
- Give full authority to the flight crew in order to achieve the best possible aircraft performance in manual flight,
- Reduce the risk of over-controlling/over-stressing the aircraft,
- Remain within safe limits.

In the normal flight envelope, the flight control laws enable the same flying techniques than on a conventional aircraft. Maneuvering is possible and may require permanent forces on the controls.

In exceptional circumstances, if one parameter is out of the protected flight envelope:
- The AP/FD, if engaged, disengages,
- The abnormal attitude law activates in order to provide full authority to the crew.

L2 For more information on the abnormal attitude law, *Refer to DSC-27-10-40 Abnormal Attitude Law*.

FE Overview



Bank Angle Protection
Pitch Attitude Protection
Load Factor Protection
Reactive Windshear Alert
Normal Flight Envelope
High Speed Protection
High Angle of Attack Protection
Protected Flight Envelope
Low Energy Protection
Alpha Floor Protection

LOAD FACTOR PROTECTION

Ident.: DSC-22-27-20-00001758.0001001 / 24 APR 14
Applicable to: ALL

The load factor is automatically limited to:
- 2.5 g to -1 g, when the slats are retracted
- 2 g to 0 g, when the slats are extended.

BANK ANGLE PROTECTION

Ident.: DSC-22-27-20-00001759.0001001 / 09 MAR 16
Applicable to: ALL

The maximum achievable bank angle is 67 °(60 ° in high lift configurations).

BANK ANGLE AUDIO INDICATOR

When the bank angle is excessive (risk of engine or wing tip strike) close to the ground, an aural "BANK BANK" is triggered.

Bank, bank (Synthetic voice)
The bank angle alert is available during manual landings, below 100 ft RA.

The bank angle threshold to trigger the aural alert depends on the RA heights.

PITCH ATTITUDE PROTECTION

Ident.: DSC-22-27-20-00001760.0002001 / 08 JUL 19
Applicable to: ALL

NOSE UP

The pitch attitude is limited to 30 ° nose up, progressively reduced to 25 ° at low speed.

NOSE DOWN

The pitch attitude is limited to 15 ° nose down.

PITCH ATTITUDE ALERT

During landing, if the pitch attitude is excessive, when close to the ground, an aural alert "PITCH PITCH" is triggered.

Pitch (Synthetic voice)
The pitch attitude aural alert is available during manual landing, below 50 ft RA.
It is triggered when the pitch attitude is above 10.5 °.
L2 This value corresponds to the maximum achievable geometrical angle on ground, with the landing gear compressed and additional margin.
L1 A tail strike pitch limit also appears on the PFD at landing.
L2 For more information, *Refer to DSC-31-CDS-40-20-30 Tail Strike Pitch Limit*
L1 If a tail strike is detected, the TAIL STRIKE alert is triggered.
L2 For more information, *Refer to PRO-ABN-TAIL_STRK TAIL STRIKE*.

HIGH SPEED PROTECTION

Ident.: DSC-22-27-20-00001761.0001001 / 04 MAY 16
Applicable to: ALL

In normal law, the aircraft is protected against overspeed.

Note: *Whatever the active flight control law, the OVERSPEED warning is triggered 4 kt above VMO, or M 0.006 above MMO (Refer to PRO-ABN-OVERSPEED OVERSPEED).*

The high speed protection activates at a threshold that depends on the acceleration of the aircraft.
The higher the acceleration, the earlier the threshold.
For a normal acceleration, the high speed protection activates when the speed is between VMO/MMO (340 kt/M 0.89) and VMO + 10 kt / MMO + 0.02.
In the case of very high acceleration, the high speed protection activates below VMO/MMO.

L12

Note: *If the AP is engaged in ALT mode, the high speed protection activates halfway between VMO/MMO and VD/MD.*

VD/MD is the design dive speed, which is the maximum structural speed:
- *VD = 375 kt*
- *MD = M 0.96*

For the activation of the high speed protection, the PRIMs compute a load factor threshold. If a load factor lower than this threshold is commanded, the high speed protection activates.

In any case, the load factor demand is limited to:
- The pitch attitude protection (nose up)
- The angle of attack protection.

In addition, when the speed reaches VMO + 5 kt with a positive acceleration, or when the speed reaches VMO + 10 kt:
- The A/THR automatically engages and targets the airspeed bug indicated on the PFD or VMO/MMO, whichever is lower
- The speedbrakes fully extend automatically.

Note: *The speedbrakes automatic extension is inhibited if the flight crew sets the sidestick half forward or beyond.*

When the speed goes below VMO + 2 kt, the speedbrakes retract automatically.
When the speed is at or below VMO, the thrust reverts to manual thrust if the A/THR was not active before the activation of the high speed protection. The level of thrust is set in accordance with the position of the thrust levers.

High Speed Protection

360
340
360
340
320
Speed Stabilized at VD -10kt / MD- .02

In manual flight, the speed target of the high speed protection depends on the sidestick deflection:
- Below VMO/MMO if the sidestick is released
- If the sidestick is full forward:
  - VD - 18 kt / MD - 0.04 with speedbrakes extended
  - VD - 10 kt / MD - 0.02 with speedbrakes not extended.

When the AP is engaged, the speed target of the high speed protection depends on the mode that is engaged:
- Halfway between VMO/MMO and VD/MD in ALT mode
- VMO + 10 kt / MMO + 0.02 in all other modes.

When the high speed protection is active:
- The bank angle is limited to 45°
- The pitch trim position is frozen
- Positive static stability is restored (the pitch attitude increases when the speed increases)
- Positive spiral stability is restored (the bank angle returns to 0° when the sidestick is released).

ANGLE OF ATTACK PROTECTION

Ident.: DSC-22-27-20-00001762.0001001 / 04 DEC 14
Applicable to: ALL

In normal law, the aircraft is protected against stall, in dynamic maneuvers or gusts.
The angle of attack protection activates when the angle of attack exceeds α_{prot}. In any case, the angle of attack cannot exceed α_{max}.

Angle of attack protection activates

When the angle of attack protection is active:
- The pitch control law controls the angle of attack (the angle of attack is proportional to the sidestick deflection) between:
  - α_{max} (Full back stick)
  - α_{prot} (Sidestick at neutral)
- Static stability is restored

- The bank angle is limited by the maximum achievable load factor (The maximum achievable bank angle is above 45 °).
- The pitch trim is frozen in the pitch-up direction.

LOW ENERGY PROTECTION

Ident.: DSC-22-27-20-00001763.0001001 / 04 MAY 16
Applicable to: ALL

The objective of the low energy alert and of the alpha floor function is to protect the flight path angle by providing means to achieve a proper level of energy:

- The low energy alert is the first level of protection. It requires crew action, for manual thrust increase.
- The alpha floor function is the second level of protection. It automatically sets maximum thrust. For more information, *Refer to DSC-22-27-20 Alpha Floor Protection*.

When it is not possible to recover a positive flight path angle using the pitch control, an aural alert “SPEED SPEED SPEED” is repeated every 5 seconds, as long as the energy has not been sufficiently increased.
For more information, *Refer to FCTM/PR-AEP-MISC Low Energy*.

Speed (Synthetic Voice)
The low energy alert is triggered when the speed is between VLS and $V\alpha_{prot}$.

L2 The low energy alert is triggered when the speed is close to $V\alpha_{prot}$, but it can be triggered closer to VLS, in the case of:

- A negative flight path angle, or
- A negative speed trend.

Low Energy Protection

$V\alpha_{prot}$
$V\alpha_{max}$
SPEED SPEED SPEED

L1 The low energy alert will be triggered during deceleration before the activation of α-floor. The delay between the low energy alert and the activation of α-floor depends on the deceleration rate.

In manual flight, the low energy alert is available:
- Below 2 500 ft RA
- Above 100 ft RA for landing, above 200 ft RA for takeoff
- In CONF 2, 3 and FULL

L2 If the slats or flaps are jammed, the low energy alert is available when the aircraft is not in clean configuration.

L1
- In all flight control laws (Normal, Alternate, and Direct)

When the AP is engaged, the low energy alert is available whatever the aircraft altitude and the position of the slats/flaps.

In manual flight or with the AP engaged, the low energy alert is inhibited when:
- At least one engine thrust lever is at TOGA, or
- α-floor is active, or
- The angle of attack has reduced below the warning threshold.

L2 The low energy alert requires the following equipment
- 1 PRIM
- 1 ADIRS

- 1 RA
- 1 FWS

ALPHA FLOOR

Ident.: DSC-22-27-20-00001764.0002001 / 03 JUL 20
Applicable to: ALL

1 To avoid flying at low speed with a low thrust, the α-floor function automatically applies TOGA thrust, when the angle of attack exceeds the α-floor threshold (between α-prot and α-max). TOGA thrust is applied, regardless of the thrust lever position and the A/THR engagement status.
If the A/THR is not active, it automatically activates. The thrust remains at TOGA, as long as the speed is at or below VLS.
The A/THR engages in A.FLOOR mode. For more information on A.FLOOR A/THR mode, *Refer to DSC-22-FG-50-50 ALPHA FLOOR*.

When the speed is above VLS:
- If the A/THR was not active before A.FLOOR mode engagement, the thrust reverts to manual thrust. The level of thrust is set in accordance with the position of the thrust levers.
- If the A/THR was active before A.FLOOR mode engagement, the thrust reverts to the mode where it was before A.FLOOR more engagement.

L2 The α-floor function activates when one of the following conditions is true:
- The angle of attack is above α-floor (α-floor depends on the aircraft's configuration)
- The angle of attack protection is active, and the sidestick deflection is close to full back stick
- The pitch up attitude protection is active, and the sidestick deflection is close to full back stick
- The speed is below VLS -5 kt, and the autopilot is engaged in cruise at an altitude above 25 000 ft.

activates

L1 α-floor is available:

- From liftoff down to 100 ft RA
- In normal law.

α-floor is inhibited if one of the following condition occurs:

- Failure of one engine below 15 000 ft
- The thrust levers are already at TOGA detent
- In clean configuration below 25 000 ft when the speed is above VLS -20 kt with the autopilot engaged
- The AP/FD TCAS mode engaged following a Resolution Advisory, and the thrust levers are at or below the CL detent

L3 If at least one thrust lever is below the CL detent when the TCAS mode engages, the α-floor is inhibited during 5 s to enable the flight crew to set the thrust levers to the CL detent.

L2 The α-floor remains inhibited as long as the TCAS mode is engaged.

L1 - EMER DES mode is engaged.

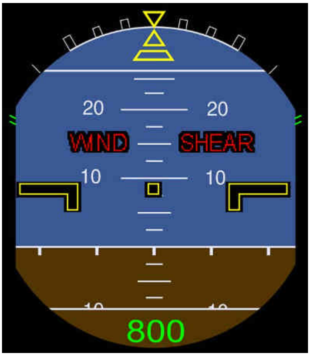
REACTIVE WINDSHEAR DETECTION

Ident.: DSC-22-27-20-00001765.0002001 / 30 JAN 17
Applicable to: ALL

A windshear alert triggers, when the aircraft encounters wind gradients during takeoff and landing, which could reduce the margin toward stall.

The windshear alert consists of:
- A red windshear message displayed on both PFDs.

Windshear



It flashes during 9 s, then remains steady, as long as the windshear is detected.
- An aural WINDSHEAR alert

Windshear (Synthetic Voice)

L2 The PRIMs ensure the reactive windshear detection.

The reactive windshear detection is available:
- During takeoff: From 50 ft or 3 s after liftoff, and until reaching 1 300 ft
- During landing: From 1 300 ft to 50 ft.

It is inhibited if the aircraft is in CONF 0.

OVERVIEW

The Auto Flight System (AFS) includes:

- The Flight Guidance (FG)
  The FG provides guidance in accordance with flight targets selected by the flight crew, or managed by the Flight Management System.
- The Flight Management System (FMS)
  The FMS manages the flight plan, defined by the flight crew, and provides flight parameters to the FG accordingly.

The AFS also includes:

- The Flight Envelope (FE)
- The Flight Control Data Concentrator (FCDC).

Ident.: DSC-22-INT-10-00001769.0001001 / 09 JUL 14

FLIGHT GUIDANCE (FG)

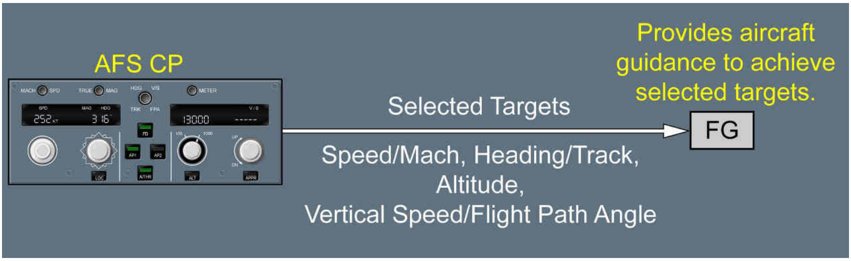
FG OBJECTIVES

The objectives of the FG are to provide lateral and vertical guidance, including speed or Mach control, based on defined targets. These targets can be either selected or managed.

Selected Targets

The flight crew selects the targets via the short-term interface: The AFS Control Panel (CP). Then the FG uses these targets to perform selected guidance.

Selected Guidance

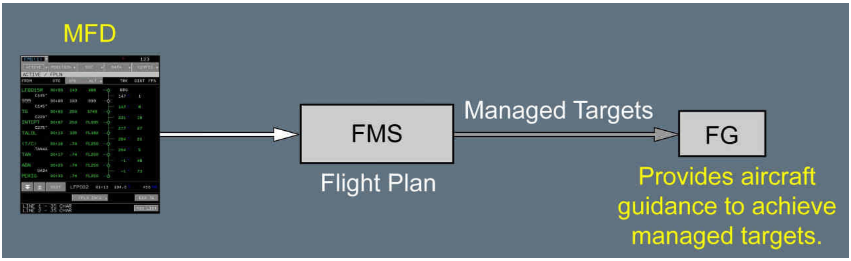


AFS CP
Provides aircraft guidance to achieve selected targets.
Selected Targets
FG
Speed/Mach, Heading/Track,
Altitude,
Vertical Speed/Flight Path Angle

Managed Targets

The flight crew uses the long-term interface, the Multi Function Display (MFD), to prepare the flight plan. The FMS calculates managed targets accordingly. Then the FG uses these targets to perform managed guidance.

Managed Guidance



Selected and Managed Guidance - Combinations

Lateral guidance and vertical guidance can be selected or managed, independently of each other. However, managed vertical guidance is not possible, when selected lateral guidance is used.

L2 The following table outlines the possible combinations:

L12

		Lateral	
		Selected	Managed
Vertical	Selected	Yes	Yes
	Managed	No	Yes

L1 Speed or Mach can be either selected or managed, regardless of lateral and vertical guidance.

AFS CP Philosophy

On the AFS CP, the SPD/MACH, HDG/TRK, V/S / FPA knobs can be turned, pulled, and pushed. This enables the flight crew to:

- Preselect a target: Turn
- Engage a mode that will guide the aircraft to a selected target: Pull
- Arm or engage a mode that will guide the aircraft to a managed target: Push.

L2 The managed mode is not applicable to the V/S / FPA knob.

L1 Here is an example with the SPD/MACH knob.

When in managed guidance, the flight crew can take over control at any time, and change to selected guidance.

FG FUNCTIONS: AP, FD AND A/THR

In order to achieve its objectives (lateral guidance, vertical guidance, including speed or Mach control), the FG uses:

- The Autopilot 1 and/or 2 (AP1 and/or AP2)
  The AP provides flight guidance by calculating pitch, roll, yaw and nosewheel steering orders.
- The Flight Directors 1 and 2 (FD1 and FD2)
  The FDs display guidance orders on the PFDs to assist the flight crew to fly the aircraft manually. When the AP is engaged, the flight crew can use the FD orders to monitor the guidance.
- The Autothrust (A/THR)
  A/THR controls the thrust by sending commands to the engines.

Refer to DSC-22-FG-10 Introduction.

Ident.: DSC-22-INT-10-00001770.0001001 / 28 APR 14

FLIGHT MANAGEMENT SYSTEM (FMS)

LONG-TERM GUIDANCE

The Flight Management System (FMS) provides long-term guidance along the inserted flight plan.
To achieve these long-term objectives, the FMS computes managed targets, that are then sent to the FG.

FMS FUNCTIONS

In addition to long-term guidance, the FMS:
- Provides flight planning and navigation information
- Calculates and optimizes performance data
- Displays information on the MFD, ND and PFD.

Refer to DSC-22-FMS-10-10 Overview.

Ident.: DSC-22-INT-10-00001771.0001001 / 28 APR 14

FLIGHT ENVELOPE (FE)

The FE computes the aircraft normal flight envelope. The FE is used by the FG and by the flight controls to prevent the aircraft from exiting the envelope.
Refer to DSC-22-27-20 General.

Ident.: DSC-22-INT-10-00001772.0001001 / 02 MAY 14

L3 FLIGHT CONTROL DATA CONCENTRATOR (FCDC)

The FCDC:
- Controls the approach capability computed by the PRIMs
  For more information, *Refer to DSC-22-FG-80 General*.
- Interfaces the AP, FD and A/THR with the FWS to enable the associated alerts to be triggered
- Generates maintenance messages for the AFS (FG and FE).
- Computes the aircraft weight and CG independently from the FQMS, via the Weight and Balance Backup Computation (WBBC) function.
  The flight controls and flight guidance functions use the WBBC to consolidate the weight and balance computation in the case of FQMS failure.

The FCDC also performs functions for the flight controls (e.g. monitoring and display of the flight control surfaces position, transmission of flight control parameters to the recorders): *Refer to DSC-27-10-10 FCDC*.
The CPIOM-J hosts two independent FCDC functions.

GENERAL ARCHITECTURE

Applicable to: ALL

Ident.: DSC-22-INT-20-00001768.0001001 / 28 APR 14

GENERAL

The AFS has:

- Three Primary flight control and guidance computers (PRIMs)
- Three Flight Management Computers (FMCs).

The flight crew interfaces with the AFS via:

- One AFS Control Panel
  The AFS CP has a backup, displayed on the MFDs. This backup is referred to as the FCU backup / AUTO FLT page.
- Two Multi Function Displays (MFDs)
- Two Primary Flight Displays (PFDs)
- Two Navigation Displays (NDs)
- One sidestick pushbutton on each sidestick
- Two thrust levers, and two A/THR instinctive disconnect pushbuttons.

General Architecture

FCU Backup
Thrust Levers

Ident.: DSC-22-INT-20-00001773.0001001 / 28 APR 14

PRIMARY FLIGHT CONTROL AND GUIDANCE COMPUTER (PRIM)

There are three PRIMs, that operate the FG. Each PRIM can operate one or both APs, and/or both FDs, and/or the A/THR.
The PRIMs also operate the FE and flight control functions.
For the PRIM architecture for the FG, *Refer to DSC-22-FG-10 Architecture*.

Ident.: DSC-22-INT-20-00001774.0001001 / 28 APR 14

FLIGHT MANAGEMENT COMPUTER (FMC)

There are two FMSs (FMS1 and FMS2), that are using three FMCs: FMC-A, FMC-B and FMC-C.

In normal operation:
- FMC-A operates FMS1
- FMC-B operates FMS2
- FMC-C is on standby, ready to operate FMS1 or FMS2.

Each FMC can operate all the flight management functions.
Refer to DSC-22-FMS-10-20 Other Aircraft Systems.

Ident.: DSC-22-INT-20-00001775.0001001 / 28 APR 14

AFS CONTROL PANEL

The AFS Control Panel is the main interface with the FG. The flight crew can:

- Engage managed or selected guidance
- Select targets for short-term guidance (speed/Mach, heading/track, altitude, vertical speed/flight path angle)
- Engage the AP, FD and A/THR
- Select altitude display in meters
- Select magnetic or true North reference.

In case the AFS CP fails, the MFD FCU BKUP / AFS CP page provides all the AFS CP controls and indicators (For more information, *Refer to DSC-31-CDS-40-70 EFIS CP Backup Function*).

Ident.: DSC-22-INT-20-00001776.0001001 / 28 APR 14

MULTI FUNCTION DISPLAY (MFD)

The MFD is the main interface with the FMS. It is also the interface of the FCU BKUP.
The flight crew can navigate through the MFD pages, and enter or modify data, with the Keyboard and Cursor Control Unit (KCCU).
For more information, *Refer to DSC-31-CDS-70-10 MFD*, and *Refer to DSC-22-FG-90-50 MFD - FCU BKUP Pages*.

Note: *The MFD also displays:*
- *The Air Traffic Control (ATC) Communication pages*
- *The Surveillance (SURV) pages*
- *The checklist menu (C/L) pages*
- *The FCU backup pages.*

Ident.: DSC-22-INT-20-00001777.0001001 / 28 APR 14

PRIMARY FLIGHT DISPLAY (PFD)

The PFD mainly displays:

- Primary flight parameters (bank angle, pitch angle, speed, Mach, heading, track, altitude, vertical speed, flight path vector, velocity vector)
- Selected and managed guidance targets (e.g. speed and altitude targets)
- Armed and engaged modes, landing capability, AP, FD and A/THR engagement status on the Flight Mode Annunciator (FMA)
- Flight Director guidance orders
- Instrument approach information.

Ident.: DSC-22-INT-20-00001778.0001001 / 28 APR 14

NAVIGATION DISPLAY (ND)

The ND mainly displays lateral and vertical parts of flight plans, and their associated navigation information. The flight crew can use the ND to modify the lateral part of the flight plan by using the KCCU.

The flight crew controls the ND display via an EFIS Control Panel, located on the glareshield.

Ident.: DSC-22-INT-20-00001779.0001001 / 28 APR 14

SIDESTICKS PUSHBUTTON

A sidestick pb, located on each sidestick, allows the AP to be disengaged.

When the AP is not engaged, the flight crew uses one of the sidesticks to fly the aircraft.

Ident.: DSC-22-INT-20-00001780.0001001 / 28 APR 14

THRUST LEVERS

The flight crew interfaces with the A/THR via the thrust levers. The detent positions are sent to the PRIMs. Then the A/THR sends thrust commands to the Full Authority Digital Engine Control (FADEC) system. The FADEC system regulates the engine thrusts.

When armed or active, the Autothrust can be disconnected by one of the two instinctive disconnect pushbuttons located on the thrust levers.

Ident.: DSC-22-INT-20-00011567.0001001 / 28 APR 14

FCU BKUP

The FCU backup function is an FCU alternative in case of EFIS CP, or AFS CP failure.

The flight crew can access the FCU backup function via the FCU BKUP pages of the MFD.

L3 The CPIOM J71 and J72 host the FCU backup function.

INTRODUCTION

Ident.: DSC-22-FG-10-00004556.0001001 / 07 NOV 16
Applicable to: ALL

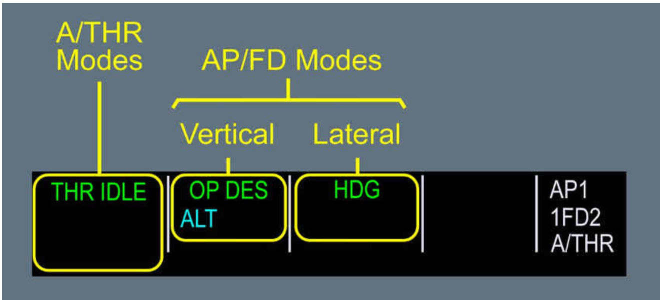
Flight Guidance (FG) operates by using the following modes:
- AP/FD lateral modes
  These modes control the lateral trajectory.
- AP/FD vertical modes

  These modes can control either:
  - The vertical trajectory, or
  - The Speed or Mach.
- A/THR modes

  These modes can control either:
  - The thrust, or
  - The speed or Mach.

Speed or Mach cannot be simultaneously controlled by the AP/FD and the A/THR.
The FG modes appear on the Flight Mode Annunciator (FMA) of the Primary Flight Displays (PFDs).

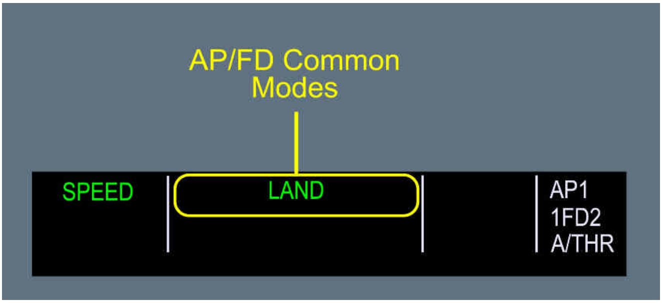
A/THR Modes and AP/FD Modes



Some AP/FD lateral and vertical modes are specifically linked to each other to form common modes. A common mode fulfills the objectives of both a lateral and a vertical mode.

LAND is an example of a common mode:
- The lateral objective is to guide the aircraft along the LOC beam
- The vertical objective is to guide the aircraft along the G/S beam.

AP/FD Common Modes



SELECTED AND MANAGED MODES

Ident.: DSC-22-FG-10-00004557.0002001 / 01 JUN 17
Applicable to: ALL

Guidance is either selected or managed. Therefore, the corresponding modes are also referred to as either selected or managed:

Guidance	Managed Modes	Selected Modes
Lateral	NAV LOC*, LOC LOC B/C*, LOC B/C F-LOC*, F-LOC RWY, RWY TRK GA TRK	HDG, TRACK
Vertical	SRS CLB ALT*, ALT ALT CRZ*, ALT CRZ ALT CST*, ALT CST DES EMER DES G/S*, G/S F-G/S*, F-G/S APP DES TCAS	OP CLB ALT*, ALT ALT CRZ*, ALT CRZ OP DES V/S, FPA

Continued on the following page

Continued from the previous page

Guidance	Managed Modes	Selected Modes
Lateral and Vertical	LAND FLARE ROLL OUT (1)	
Speed or Mach	SPEED, MACH with FMS reference.	SPEED, MACH with AFS CP reference.

(1) *These modes are common modes.*

A selected guidance has always priority over the managed guidance.

INTERACTION BETWEEN AP/FD AND A/THR

Ident.: DSC-22-FG-10-00004558.0002001 / 01 JUN 17
Applicable to: ALL

The AP/FD vertical mode determines the associated A/THR mode:

- When an AP/FD vertical mode controls a speed or Mach target, the A/THR mode controls the thrust.
  L2 The vertical trajectory is a result of speed or Mach, and of thrust.
- L1 When an AP/FD vertical mode controls the vertical trajectory, the A/THR mode controls a speed or Mach target.

  Note: *During ROLL OUT, and during FLARE with the AP on, the A/THR mode controls the thrust at idle.*

- If no AP/FD mode is engaged, when the A/THR engages, the A/THR engages in SPEED or MACH mode, in order to control a speed or Mach target.

AP/FD		A/THR	
Vertical Modes	**Objectives**	**Modes**	**Objectives**
SRS OP CLB CLB OP DES EMER DES DES in idle path	Control of speed or Mach target	THRUST modes	Control of thrust

For information on AP/FD modes, *Refer to DSC-22-FG-70-10 Introduction*.

ARCHITECTURE

Ident.: DSC-22-FG-10-00004559.0001001 / 04 MAY 16
Applicable to: ALL

There are three PRIMs. Each PRIM can operate one or both APs, and/or FDs, and/or A/THR.

To determine which PRIM will operate the engaged AP(s), FDs, and A/THR, each PRIM computes its operational capability, taking into account:
- Manual flight guidance capability,
- Automatic flight guidance capability (e.g. FE, AP, FD, A/THR capabilities).

The Master PRIM is the PRIM that has the best operational capability. The Slave 1 PRIM has the second best operational capability, and the Slave 2 PRIM has the third best.

L2 When all the PRIMs have the same capability, the first PRIM that is electrically supplied is the Master PRIM.

L1 The Master PRIM has the priority to operate AP(s), FDs and A/THR.

If the Master PRIM loses the best operational capability, the engaged AP, FDs and A/THR do not disconnect. They are transferred to the Slave 1 PRIM, and:
- The Slave 1 PRIM becomes the Master PRIM
- The two other PRIMs become Slave 1 PRIM and Slave 2 PRIM.

In the following example, all the PRIMs initially have the same capability, AP2 is engaged, FDs are engaged, A/THR is armed or active, and PRIM1 fails:

GENERAL

Ident.: DSC-22-FG-30-10-00004561.0001001 / 03 DEC 15
Applicable to: ALL

The Flight Director (FD) displays guidance orders on the Primary Flight Displays (PFDs):

- If no AP is engaged, the flight crew can manually fly the aircraft by following FD orders
- If at least one AP is engaged, the flight crew can use the FD to monitor the flight guidance.

There are two FDs, referred to as FD 1 and FD 2.

In normal operation, FD guidance orders appear as the following:

- FD 1 guidance orders appear on the Captain's PFD

L2 To compute guidance orders, the FD 1 uses data displayed on the Captain's side (e.g. FMS 1, MMR 1 in normal operation).

L1
- FD 2 guidance orders appear on the First Officer's side

L2 To compute guidance orders, the FD 2 uses data displayed on the First Officer's side (e.g. FMS 2, MMR 2 in normal operation).

FD DISPLAY

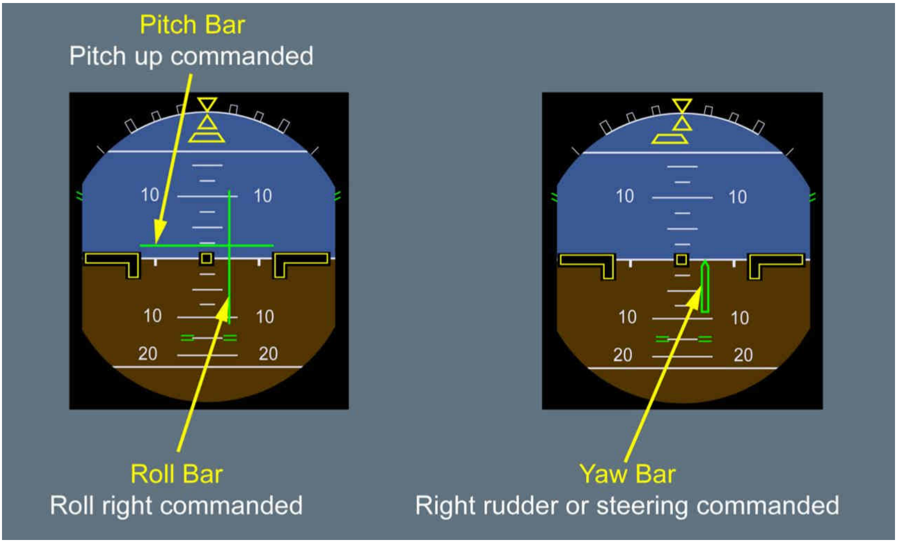
Ident.: DSC-22-FG-30-20-00004562.0002001 / 05 NOV 15
Applicable to: ALL

The pitch, roll, and yaw bars respectively indicate the pitch, roll, and yaw FD guidance orders.

Note: *Independently from FD display, the Flight Path Vector(Velocity Vector) can be displayed on the PFDs. The Flight Path Vector(Velocity Vector) does not indicate guidance orders. The flight crew must not use the Flight Path Vector(Velocity Vector) as guidance orders. However, the Flight Path Vector(Velocity Vector) provides an indication of the aircraft trajectory with respect to the ground reference.*
For definition and display conditions of the Flight Path Vector(Velocity Vector), Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector.

FDS ARE ENGAGED

When the FDs are engaged, the PFDs can display the roll, pitch and yaw bars.



Pitch Bar
Pitch up commanded
10
10
10
10
20
20
Roll Bar
Roll right commanded
10
10
10
10
20
20
Yaw Bar
Right rudder or steering commanded

When the FDs are engaged, the display conditions of the guidance orders are:

- For lateral guidance orders:
  The yaw bar is displayed during takeoff or landing roll. Otherwise, the roll bar is displayed when a lateral mode is engaged.
  L2 The yaw bar only appears in RWY and ROLL OUT.
- L1 For vertical guidance orders:
  The pitch bar is displayed after liftoff when the tail strike pitch limit disappears, and when a vertical mode is engaged.
  L2 With the AP on, the pitch bar disappears in ROLL OUT.
  With the AP off, the pitch bar disappears below 50 ft RA.

L1 FD s ARE NOT ENGAGED

If the FDs are not engaged, the FD bars do not appear on the PFDs.

INTRODUCTION

Ident.: DSC-22-FG-30-30-00004563.0001001 / 06 AUG 14
Applicable to: ALL

FD1 and FD2 engage at the same time.

L3 The FDs are available in normal and alternate laws, only.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-30-30-B-00004566.0001001 / 06 AUG 14

MANUAL ENGAGEMENT

Both FD1 and FD2 manually engage, when the flight crew presses the FD pb on the AFS CP. If no AP was previously engaged, then HDG or TRACK, and V/S or FPA engage. The FD bars flash for 10 s.

Ident.: DSC-22-FG-30-30-B-00004564.0001001 / 09 JUL 19

AUTOMATIC ENGAGEMENT ON GROUND

On ground, the FDs automatically engage at aircraft power-up, when the IRs and ADRs are aligned.

Ident.: DSC-22-FG-30-30-B-00004567.0002001 / 01 JUN 17

AUTOMATIC ENGAGEMENT IN FLIGHT

If not already engaged, FD1 and FD2 automatically engage, if:
- The flight crew engages a go-around, or
- L2 The thrust levers are set to TOGA or FLX during takeoff, or
- L1 The AP/FD TCAS mode engages upon a Resolution Advisory, or
- The EMER DES mode engages.

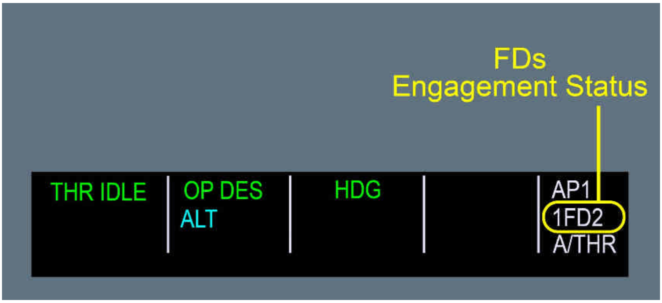
ENGAGEMENT ANNUNCIATION

Ident.: DSC-22-FG-30-30-00004568.0001001 / 03 DEC 15
Applicable to: ALL

When the FDs engage:
- The FD pb on the AFS CP comes on
- 1FD2 appears on both FMAs
- When a mode is active, the PFDs display the FD orders.
  For FD display conditions on PFDs, *Refer to DSC-22-FG-30-20 FD Display*.

The engagement status of the FD appears in the AP, FD, A/THR engagement status column of both FMAs.

FD Engagement



The possible FD messages are:

L12

FMA Message	Meaning
1FD2	FD1 and FD2 are engaged.
1FD-	FD1 and FD2 are engaged but the FD bars are not displayed on FD2. The AIR DATA selector is set on the F/O ON BKUP position. The air data displayed on the PFD of the F/O are not the same compared to the air data used by the FD2 guidance. Associated with the NAV F/O PFD ON BKUP alert (*Refer to procedure*).
-FD2	FD1 and FD2 are engaged but the FD bars are not displayed on FD1. The AIR DATA selector is set on the CAPT ON BKUP position. The air data displayed on the PFD of the CAPT are not the same compared to the air data used by the FD1 guidance. Associated with the NAV CAPT PFD ON BKUP alert (*Refer to procedure*).
No FD message	No FD is engaged.

GENERAL

Ident.: DSC-22-FG-30-40-00015901.0001001 / 06 AUG 14
Applicable to: ALL

FD1 and FD2 disengage at the same time.

When the FDs disengage with no AP engaged:
- Lateral and vertical modes disengage (if they are engaged)
- A/THR automatically reverts to SPEED or MACH mode, if the A/THR is engaged in THRUST mode.

When the FDs disengage with one or two AP engaged:
- The AP lateral and vertical modes remain engaged
- The A/THR mode remains engaged.

MANUAL DISENGAGEMENT

Ident.: DSC-22-FG-30-40-00015900.0001001 / 06 AUG 14
Applicable to: ALL

The flight crew can manually press the FD pb to disengage the FDs.

DISENGAGEMENT OF BOTH FDs

Ident.: DSC-22-FG-30-40-00004569.0001001 / 05 NOV 18
Applicable to: ALL

L2 AP/FD COMMON DISENGAGEMENT

The AP/FDs automatically disengages, if one of the following occurs:

L3
- In ROLL OUT, the difference between the aircraft track and the runway track is more than 20 °
- Both the AFS CP and the AFS CONTROL PANEL page of MFD FCU BKUP are not available. Nevertheless, if the failure occurs when LAND, FLARE, ROLL OUT or go-around is engaged, the AP/FDs remain operative and engaged.

L2
- In the case of an all engine flame out, the AP/FD disconnects when the RAT extends, if the vertical mode is not OP DES. Nevertheless, the AP 1 remains available and the flight crew can engage the AP/FD again.
- In approach, the LOC signal is disturbed (for example LOC beam masking). Nevertheless, as the disturbance may be temporary, the flight crew can engage the AP/FD again.
- The FD and AP become inoperative

Note: *If the FDs are inoperative, the AP is also inoperative.*

L1 **SPECIFIC FDs DISENGAGEMENT**

Both FDs can disengage, when no AP is engaged, if the aircraft speed is either:

- The aircraft speed is 2 kt below VLS in DES, OP DES
  If A/THR is engaged, the A/THR mode reverts to SPEED or MACH, and increases the thrust to recover the speed target. A triple click audio indicator sounds.
- The aircraft speed is 4 kt above VMAX in CLB or OP CLB.
  Associated with the OVERSPEED alert.
  If A/THR is engaged, the A/THR mode reverts to SPEED or MACH, and reduces the thrust to recover the speed target. A triple click audio indicator sounds.
- The thrust levers are set to TOGA and red terrain(obstacle) alerts are triggered.

L2 *Refer to DSC-34-SURV-20-10 Terrain Function*.

DISENGAGEMENT ANNUNCIATION

Ident.: DSC-22-FG-30-40-00004570.0001001 / 03 DEC 15
Applicable to: ALL

When both FDs disengage:

- The FD pb goes off
- 1FD2 , 1FD- or -FD2 message is cleared from the FMA.

PITCH AND ROLL BAR FLASHING

Ident.: DSC-22-FG-30-50-00004571.0001001 / 03 DEC 15
Applicable to: ALL

The pitch and/or roll bars flash for 10 s on both PFDs:

- If an automatic mode reversion to HDG-V/S (TRK-FPA) occurs
  The roll (pitch) bar will flash.
  A triple click audio indicator sounds.
- If all AP and FDs were previously off, and the flight crew engages the FDs.
  HDG-V/S, or TRK-FPA engage. Both pitch and roll bars will flash.

The pitch or roll bar flashes on PFD1(2), if a failure occurs in approach:

- The roll bar flashes, if LOC*, LOC B/C*, F-LOC*, LOC, LOC B/C, F-LOC, LAND or FLARE is engaged, and the MMR1(2) is not able to compute the associated lateral deviation.
  L3 This is applicable above 15 ft RA.
- L1 The pitch bar flashes, if G/S*, F-G/S*, G/S, F-G/S, LAND or FLARE is engaged, and the MMR1(2) is not able to compute the associated vertical deviation.
  L3 This is applicable above 100 ft RA.

L1 The pitch or roll bar(s) stop flashing, when one of the engaged above mode disengages.

L2 The pitch bar flashes, if the flight crew modifies the AFS CP selected altitude during the altitude capture.

L1 Note: *In some cases, AP and FDs disengage at once, or 7 s after the failure. Then, the FDs automatically reengage in HDG-V/S or TRK-FPA. A triple click audio indicator sounds. The FD bars flash for 10 s on both PFDs.*

For more information about FD indication in case of LS transmitter failure during approach, *Refer to DSC-22-FG-100-20 Failure of the LS Transmitter*.

FD FLAG

Ident.: DSC-22-FG-30-50-00006060.0001001 / 06 AUG 14
Applicable to: ALL

If pitch, roll, and yaw orders are not available when the FDs are engaged, a red FD flag flashes on the PFDs, and then remains steady.
When the flag appears, the PFDs bars are not displayed.

FD Flag

GENERAL

Ident.: DSC-22-FG-40-10-00005092.0001001 / 03 DEC 15
Applicable to: ALL

The Autopilot (AP):
- Stabilizes the aircraft around its center of gravity
- Controls the lateral trajectory
- Controls the vertical trajectory, or speed/Mach
- Coordinates with the A/THR
- Performs the automatic landing, or the go-around.

The AP generates:
- Pitch, roll, and yaw orders
- The nosewheel angle.

There are two APs: AP 1 and AP 2.
AP 1 uses system data displayed on Captain's side, and AP 2 uses system data displayed on First Officer's side.

L2 In normal operation, AP 1 uses FMS 1, MMR 1 and AP 2 uses FMS 2, MMR 2. In the case of failure, the AP function can use any system.

Intentionally left blank

INTRODUCTION

Ident.: DSC-22-FG-40-20-00005093.0001001 / 03 DEC 15
Applicable to: ALL

AP1 and AP2 usually engage separately. In some conditions, the flight crew can engage both at the same time.
When the AP engages, the sidesticks are locked in the neutral position, and the force to move the rudder pedals increases. However, the flight crew can always disengage the AP and the locking devices.
The AP engages with the same guidance mode previously used by the FD.
If the FDs were not previously engaged, the AP engages in HDG or TRACK, and V/S or FPA.
L3 The APs are available in normal and alternate law, only.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-40-20-G10-00005095.0001001 / 01 JUN 17

MANUAL ENGAGEMENT OF ONE AP

One AP engages when the flight crew presses the AP1 pb or the AP2 pb on the AFS CP, and the aircraft is in flight for more than 5 s.

L3 The AP engages only if the aircraft pitch, bank angle, and speed are not excessive.

- The pitch is between -30 ° and 50 °
- The bank angle is less than 120 °
- The CAS is between 70 kt and 420 kt.

L2 *Note:* *1. In flight, the flight crew can engage the AP, even if the sidestick or the rudder pedals are deflected.*
However, the AP becomes active only if the flight crew reverts the sidestick and the rudder pedal to the neutral position within 6 s. If not, the AP disengages.
2. AP engagement increases the breakout force on the sidesticks and on the rudder pedals.

Ident.: DSC-22-FG-40-20-G10-00005096.0001001 / 01 JUN 17

MANUAL ENGAGEMENT OF BOTH APs

When one AP is engaged, the flight crew can press the second AP pb to engage the second AP.

However, the second AP can engage, only when one of the following conditions is applicable:
- The following approach modes are armed or engaged:
  - LOC is armed, or LOC* or LOC is engaged, and
  - G/S is armed, or G/S* or G/S is engaged
- L3 LAND can engage
- Go-around is engaged.

L1 When both APs are engaged, AP1 is active, and AP2 is on standby, regardless of the order of AP engagement.

Ident.: DSC-22-FG-40-20-G10-00023933.0001001 / 01 JUN 17

AUTOMATIC ENGAGEMENT OF ONE AP

One AP automatically engages when EMER DES mode automatically engages.
L3 For more information on the AUTO EMER DESCENT function, *Refer to DSC-22-FG-70-60-40 Engagement Conditions*.

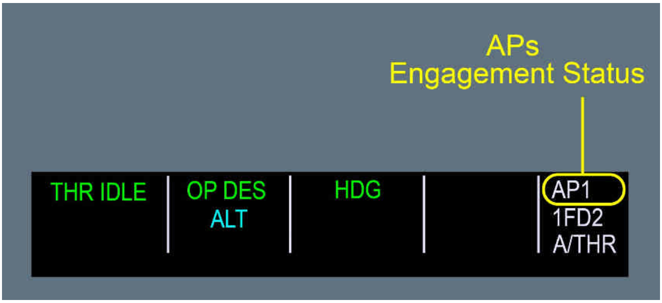
ENGAGEMENT ANNUNCIATION

Ident.: DSC-22-FG-40-20-00005097.0001001 / 06 AUG 14
Applicable to: ALL

When AP1(2) engages:
- The AP1(2) pb comes on
- Both FMAs display:
  - AP1 (AP2)
  - AP1+2, if both APs are engaged.

The engagement status of the AP appears in the AP, FD, A/THR engagement status column of FMAs.

AP Engagement Status



The possible AP messages are:

FMA Message	Meaning
AP1	AP1 is engaged.
AP2	AP2 is engaged.
AP1+2	Both APs are engaged.

Intentionally left blank

MANUAL DISENGAGEMENT

Ident.: DSC-22-FG-40-30-00005098.0001001 / 06 AUG 14
Applicable to: ALL

The AP(s) disengages, when:
- The flight crew presses the sidestick pb on any sidestick
- The flight crew presses the AP 1(2) pb, when AP 1(2) is already engaged
- The flight crew moves a sidestick above a specific threshold

L3 The sidestick deflection goes beyond 5 ° on pitch axis, or 6 ° on roll axis.

L1 - The flight crew moves the rudder pedals above a specific threshold.

L3 The rudder pedal deflection goes beyond 12 °.

L1 Airbus recommends to press the sidestick pb two times to disengage all AP(s) engaged.
L2 One time to disengage the APs, the second time to clear the associated AP OFF alert.
L1 The other ways of disengagement are to be avoided. In particular, the disengagement of the AP(s) with the sidestick, or the rudder pedal deflection is very uncomfortable for passengers.

Note: At the end of the flight, the AP does not automatically disengage.

AUTOMATIC DISENGAGEMENT

Ident.: DSC-22-FG-40-30-00005099.0001001 / 05 NOV 18
Applicable to: ALL

L2 AP/FD COMMON DISENGAGEMENT

The AP/FDs automatically disengages, if one of the following occurs:
- L3 In ROLL OUT, the difference between the aircraft track and the runway track is more than 20 °
- Both the AFS CP and the AFS CONTROL PANEL page of MFD FCU BKUP are not available. Nevertheless, if the failure occurs when LAND, FLARE, ROLL OUT or go-around is engaged, the AP/FDs remain operative and engaged.
- L2 In the case of an all engine flame out, the AP/FD disconnects when the RAT extends, if the vertical mode is not OP DES. Nevertheless, the AP 1 remains available and the flight crew can engage the AP/FD again.
- In approach, the LOC signal is disturbed (for example LOC beam masking). Nevertheless, as the disturbance may be temporary, the flight crew can engage the AP/FD again.
- The FD and AP become inoperative

  Note: If the FDs are inoperative, the AP is also inoperative.

L1 AP SPECIFIC DISENGAGEMENT

The AP automatically disengages, if one of the following occurs:

L2
- The aircraft is on ground, and the first engine starts

L1
- The SRS GA disengages after a go around with both APs engaged
  In this case, AP2 disengages, and AP1 remains engaged.
- After landing, the flight crew performs a touch and go with both thrust levers at or above the FLX/MCT detent

L2 *Note: If the FDs were not previously engaged, they engage.*

- The flight crew engages the AP while the sidestick or the rudder pedals are deflected, and the sidestick or the rudder pedals are still deflected 6 s after AP engagement

L1
- A failure occurs in approach:
  - The lateral deviation is no longer available on both MMRs, when LOC, F-LOC,or LOC B/C is engaged
    L3 This is applicable above 200 ft RA.
    The failure must be confirmed for 7 s.
  - L1 The vertical deviation is no longer available on both MMRs, when G/S, or F-G/S is engaged
    L3 This is applicable above 200 ft RA.
    The failure must be confirmed for 7 s.
  - L1 The lateral or vertical deviation from the MMR is erroneous, or the approach parameters are different in both MMRs when:
    - ■ LOC, LOC B/C, or F-LOC is armed, or
    - ■ LOC, LOC B/C, or F-LOC, is engaged.
    - ■ LAND, FLARE, or ROLL OUT is engaged
  - L2 The difference between the aircraft track and the runway track is more than 7 ° when in LOC, or LAND, and the AP is engaged.
    L3 This is applicable above 100 ft for an erroneous vertical deviation.
    The difference must be confirmed 5 s.
    This is applicable between 700 ft and 200 ft RA

L1 *Note: In all these cases of failure in approach, the FDs remain engaged. However, a reversion to HDG/TRACK and V/S / FPA occurs.*

DISENGAGEMENT ANNUNCIATIONS AND WARNINGS

Ident.: DSC-22-FG-40-30-00005100.0001001 / 06 AUG 14
Applicable to: ALL

When AP1(2) disengages:
- AP1(2) pb goes off
- On both FMAs:
  - If one AP was previously engaged, the AP1 (AP2) message disappears
  - If both APs were previously engaged, the AP2 (AP1) message replaces the AP1+2 message.

Different warnings are triggered, depending on the way of disconnection.

Note: *When both APs are engaged, and only one AP disengages, the warnings is not triggered. However, a triple click occurs if the AP disengages during the approach, and the landing capability is LAND 3 DUAL.*

DISCONNECTION VIA THE sidestick pb

The normal way to disconnect the AP is to press the sidestick pb two times.

When the flight crew presses the sidestick pb for the first time, the following warnings are triggered, and will continue, until the flight crew presses the sidestick pb a second time:
- The AP OFF memo appears on the PFDs and on the WD
- A cavalry charge audio indicator sounds, at low volume
  L3 The maximum duration is 0.8 s.
- L1 The MASTER WARN light comes on.

When the flight crew presses the sidestick pb the second times or the MASTER WARN light, all the above warnings are cleared.

L2 The flight crew must press the sidestick pb a second time or the MASTER WARN light within 1.8 s .

L1 If the flight crew does not quickly press the sidestick pb a second time, the following additional warnings will trigger:
- The cavalry charge audio indicators sounds, at high volume
- The AUTO FLT AP OFF alert is displayed.

L2 The additional warnings is triggered 1.8 s after the sidestick pb is pressed the first time.

L1 When the flight crew presses the MASTER WARN light, or the sidestick pb a second time, the cavalry charge audio indicator stops and the memos disappear, but the AUTO FLT AP OFF remains displayed on the WD.

OTHER WAYS OF DISCONNECTION

If the AP disengages, without any flight crew action on the sidestick pb, the following warnings will trigger:

- The AP OFF memo appears on the PFDs
- A cavalry charge audio indicator sounds, at high volume
- The AUTO FLT AP OFF alert is displayed.

L2 For more information, *Refer to PRO-ABN-AUTO_FLT AUTO FLT AP OFF*.

L1 When the flight crew presses the MASTER WARN light, or the sidestick pb (one time), the cavalry charge stops and the memo disappears, but the alert remains displayed on the WD.

AP IN PROTECTION

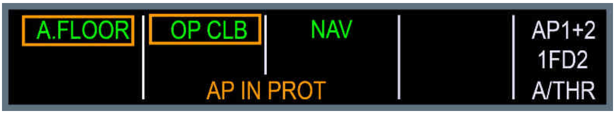
Ident.: DSC-22-FG-40-40-00018680.0001001 / 02 OCT 14
Applicable to: ALL

In abnormal operation, if the aircraft enters the protected flight envelope or if the flight crew engages the AP in the protected flight envelope, the AP/FD remains engaged. However, in the protected flight envelope, the flight control law of the flight envelope protection takes over the autopilot.
When the aircraft exits the protected flight envelope and comes back in the normal flight envelope, the autopilot recovers the current aircraft guidance.
For more information about the flight envelope protection, *Refer to DSC-22-27-20 General*.

ANNUNCIATION

When the AP is in protection mode:
- The AP IN PROT message appears on the FMA, below the lateral and vertical modes
- The FMA displays an amber flashing box around the vertical mode, if the AP is not able to maintain the vertical guidance
- A triple click sounds.

Example of FMA in AP Protection



Intentionally left blank

GENERAL

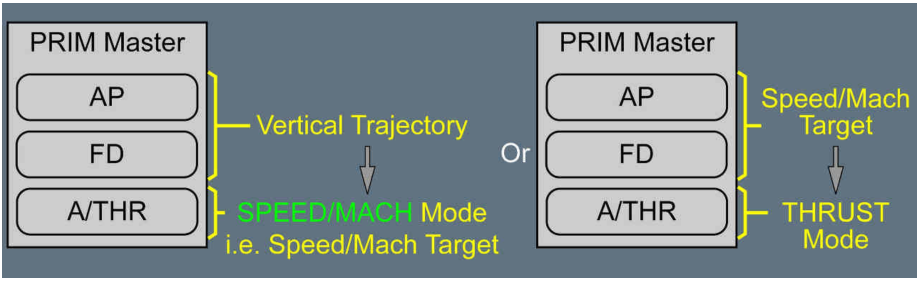
Ident.: DSC-22-FG-50-10-00005660.0001001 / 06 AUG 14
Applicable to: ALL

The autothrust (A/THR) manages the engine thrust.
The A/THR is either armed, active, or disconnected.

When active, two different types of A/THR modes are available:
- The SPEED/MACH mode:
  The A/THR continuously adjusts the thrust in order to maintain a speed/Mach target (e.g. during cruise, and approach).
- The THRUST modes:
  The A/THR controls a fixed thrust, in accordance with the engaged THRUST mode.

The A/THR modes are automatically linked to the AP/FD vertical modes:
- When an AP/FD vertical mode controls the trajectory (e.g. altitude acquire modes, altitude hold modes, V/S / FPA, G/S, F-G/S), the A/THR is in SPEED/MACH mode
- When an AP/FD vertical mode adjusts the aircraft pitch in order to keep a speed/Mach target (e.g. climb, descent), the A/THR is in THRUST mode.

AP/FD / A/THR Interaction



When the A/THR is active, the A/THR thrust target is sent to both FADECs. The FADECs computes thrust commands, in accordance with the aircraft environment and status. The thrust commands are then sent to the engines.
When the A/THR is armed, the FADECs compute the thrust commands in accordance with the thrust lever positions, and the selection of FMS PERF page - T.O panel.
When the A/THR is disconnected, the FADECs compute the thrust commands in accordance with the thrust lever positions.
For more information on thrust control performed by the FADECs: *Refer to DSC-70-10-30-30 Thrust Control*.

A/THR ARCHITECTURE

Ident.: DSC-22-FG-50-10-00005661.0001001 / 06 AUG 14
Applicable to: ALL

Each PRIM can perform the A/THR. Therefore, there are three A/THR channels. The Master PRIM performs the A/THR. For information on Master PRIM, *Refer to DSC-22-FG-10 Architecture*.
To compute A/THR targets, the A/THR uses system data associated to the engaged AP.

L3 In normal operation:
- When AP 1 is engaged, or with no AP, or with both APs engaged, the A/THR uses data from ADIRU 1, and FMS 1
- When AP 2 is engaged, the A/THR uses data from ADIRU 2, and FMS 2.

THRUST LEVERS

Ident.: DSC-22-FG-50-20-00005662.0001001 / 02 OCT 14
Applicable to: ALL

The flight crew uses the thrust levers to:
- Arm, activate, and disconnect the A/THR
- Engage the takeoff and go-around modes
  - L2 For more information about SRS engagement at take off, *Refer to DSC-22-FG-70-20-30 Engagement Conditions*
  - For more information about SRS engagement in go-around, and *Refer to DSC-22-FG-70-90-20 Engagement Conditions*
- L1 Manually control the thrust of each engine, when the A/THR is disconnected

  L2 For more information about the use of the thrust levers when the A/THR is disconnected, *Refer to DSC-70-10-30-30 Thrust Control in Manual Mode*.
- L1 Engage reverse thrust.

The thrust levers have:
- Four detents: 0 (idle), CL, FLX-MCT, TOGA.
- Two instinctive disconnect pushbuttons.

L2 For more information about the thrust levers, *Refer to DSC-22-FG-90-70 Thrust Levers*.

Intentionally left blank

PRELIMINARY CONDITIONS REQUIRED FOR A/THR ARMING OR ACTIVATION

Ident.: DSC-22-FG-50-30-00005663.0001001 / 03 DEC 15
Applicable to: ALL

L2 In order to be able to arm or activate the A/THR, all of the following conditions must be applicable:
- At least one PRIM is available
- The A/THR is not permanently disconnected for the remainder of the flight
- The AFS CP, or the AFS CP page of the FCU backup is available, except in A.FLOOR , go-around, LAND, FLARE or ROLL OUT

L3 - Both FADECs are operative

A/THR ARMING

Applicable to: ALL

Ident.: DSC-22-FG-50-30-GAARM-00005664.0001001 / 03 DEC 15

The flight crew arms the A/THR at takeoff, when the thrust levers are set at the TOGA or FLX-MCT detent, in accordance with the TOGA, FLEX, or DERATED selection on the T.O panel of the FMS PERF page. The A/THR controls the thrust to TOGA, FLEX or DERATED.
When the aircraft reaches the thrust reduction altitude, and the flight crew sets the thrust levers at the CL detent (or FLX-MCT detent, if at least one engine is out), the A/THR activates.
For scenario example, *Refer to DSC-22-FG-50-60 From Takeoff to Thrust Reduction Altitude*.
The A/THR also arms when the flight crew engages a go-around (MAN TOGA) or a soft go-around (MAN GA SOFT) : The flight crew sets the thrust levers at the TOGA detent. Then, in the case of soft go-around, the flight crew retards the thrust levers to the FLX-MCT detent.
In go-around, the A/THR controls the thrust in accordance with the thrust lever position:

- At the TOGA detent, the thrust target is the TOGA thrust
- At the FLX-MCT detent, when TOGA was previously set in the case of soft go-around, the thrust target is a thrust that targets a vertical speed of 2 000 ft/min.

For scenario example, *Refer to DSC-22-FG-50-60 From Soft Go-around to Thrust reduction Altitude*.
When the aircraft reaches the go-around thrust reduction altitude, the flight crew sets the thrust levers at the CL detent (or FLX-MCT detent, if at least one engine is out), and as a consequence the A/THR activates.

Ident.: DSC-22-FG-50-30-GAARM-00005666.0002001 / 01 JUN 17

ARMING CONDITIONS

The A/THR arms, if one of the following occurs:

- SRS TO engages
  For more information, *Refer to DSC-22-FG-70-20-30 Engagement Conditions*.
- SRS GA engages
  For more information, *Refer to DSC-22-FG-70-90-20 Engagement Conditions*.
- The A/THR is disconnected, and the flight crew presses the A/THR pb, when:
  - The thrust levers are:
    - ■ Above CL, when all engines are operative
    - L2 ■ Above FLX-MCT, if one engine is out.
  - L3 The aircraft is above 100 ft RA, or all RAs are failed.
  - LAND or FLARE is not engaged.
- L1 The A/THR is disconnected and the thrust levers are not in the A/THR active range, and:
  - The AP/FD TCAS mode engages due to a resolution advisory alert
  - The EMER DES mode engages.

In addition, when the A/THR is active, it can become armed by a flight crew action on the thrust levers: *Refer to DSC-22-FG-50-30 Effect of thrust lever movement when the A/THR is active*.

Ident.: DSC-22-FG-50-30-GAARM-00005667.0001001 / 08 JUL 20

1 FMA DISPLAY

When the A/THR is armed:

- The FMA displays:
  - The A/THR message on the third line of the fifth column
  - MAN TOGA, MAN FLX +XX, MAN DTO, MAN MCT, MAN THR, or MAN GA SOFT messages on the first and second lines of the first column
    This indication is in a white box.
- The A/THR pb light is on, on the AFS CP.

As long as the A/THR is not active, the A/THR messages on the FMA displays the manual thrust as follows:

Conditions		**Thrust lever position**	**FMA Message** (1)
From takeoff, and until the thrust reduction altitude.	TOGA is selected on the T.O panel of the FMS PERF page.	TOGA (2) (3)	MAN TOGA
	FLX is selected on the T.O panel of the FMS PERF page.	FLX-MCT (3)	MAN FLX +XX
	DERATED is selected on the T.O panel of the FMS PERF page.	FLX-MCT (3)	MAN DTO
In descent, or approach.	The flight crew performs a go-around.	TOGA (3) (4)	MAN TOGA
	The flight crew performs a soft go-around.	TOGA then FLX-MCT(3) (4)	MAN GA SOFT

(1) *The FMA message appears in a white box, on the first and second lines of the first column.*

(2) *If the flight crew sets the thrust levers to FLX-MCT, MAN MCT will appear on FMA.*

(3) *If the flight crew sets the thrust levers between CL and TOGA, but not at the CL, FLX-MCT, or TOGA detent, MAN THR will appear on FMA.*

(4) *If the flight crew sets the thrust levers directly to FLX-MCT and not TOGA then FLX-MCT, the MAN THR will appear on the FMA.*

L2 The following table presents the detailed display conditions of A/THR messages, when the A/THR is not active (manual thrust):

FMA Message	**Display Conditions**
MAN TOGA (1)	One thrust lever is set at the TOGA detent and the associated engine is running.
MAN GA SOFT (1)	All of the following conditions are applicable: - At least one engine is in go-around soft thrust(3) - The thrust levers are above the CL detent, and at or below the FLX-MCT detent. Note: *If an engine fails, or a thrust lever is set to idle, or an engine thrust is not in go-around soft thrust during the go-around, the soft go-around function remains operative on the operative engine, and MAN GA SOFT is still displayed. However, the LVR TOGA appears and requests the flight crew to set the thrust lever of the operative engine at the TOGA detent.*
MAN FLX +XX(1)	All of the following conditions are applicable: - FLX is set on the T.O panel of the FMS PERF page - One thrust lever is at the FLX-MCT detent, and the other thrust lever is at or below the FLX-MCT detent.

Continued on the following page

Continued from the previous page

FMA Message	Display Conditions
MAN DTO(1)	All of the following conditions are applicable: - DERATED is selected on the T.O panel of the FMS PERF page - One thrust lever is at the FLX-MCT detent, and the other thrust lever is at or below the FLX-MCT detent.
MAN MCT(1)	All of the following conditions are applicable: - One thrust lever is at the FLX-MCT detent, and the other thrust lever is at or below the FLX-MCT detent. - MAN FLX +XX, MAN DTO, MAN GA SOFT cannot engage.
MAN THR(2)	One of the following conditions is applicable: - One thrust lever is between the FLX-MCT and TOGA detents, or - Both thrust levers are between the CL and FLX-MCT detents.

(1) *The FMA message appears in a white box.*

(2) *The FMA message appears in an amber box.*

(3) *The GA SOFT mode engages if all the following conditions are applicable when the flight crew sets the thrust levers to TOGA, then to the FLX-MCT detent during the go-around :*
- *The Slats or flaps are extended*
- *Both engines are operative*
- *The aircraft is below the go-around thrust reduction altitude*
- *The aircraft is not performing a touch and go*
- *The aircraft is below 16 000 ft.*

A/THR ACTIVATION

Applicable to: ALL

Ident.: DSC-22-FG-50-30-GAACT-00005665.0001001 / 06 AUG 14

When active, the A/THR controls:
- The thrust, when an A/THR THRUST mode is engaged, or
- The speed/Mach, when the A/THR SPEED/MACH mode is engaged.

The thrust lever positions determine the maximum thrust that the A/THR can command (except in A.FLOOR).

The normal position of the thrust levers is:
- At the CL detent, when all engines are operative
- At the FLX-MCT detent for the operative engine, when the other engine is out.

ACTIVATION CONDITIONS

The A/THR activates, if one of the following occurs:

- The A/THR is armed, and the flight crew sets the thrust levers on the active range:

L13

Engine Condition	**Active Range**
Both engines are operative.	Both thrust levers are above idle, and at or below the CL detent. The A/THR also activates when: - One thrust lever is above the idle detent, and at or below the CL detent, and - The other thrust lever is • At the idle detent, or • Above the CL detent, and at or below the FLX-MCT detent. Note: *In the case of takeoff with FLEX or DERATED selection, the thrust lever must be below the FLX-MCT detent.*
One engine is out. (1)	One thrust levers is above the idle detent, and at or below FLX-MCT detent. If the engine-out occurs during a FLEX or DERATE takeoff, the flight crew activates the A/THR by: 1. Setting the thrust lever of the operative engine below FLX-MCT, 2. Then, settings the thrust lever of the operative engines back to FLX-MCT.

(1) *The thrust lever of the failed engine should be at the idle detent.*

- The A/THR is disconnected, and the flight crew presses the A/THR pb on the AFS CP when:
  - The thrust levers are on the active range,
  - L3 The aircraft is above 100 ft RA, or all RAs are failed
  - LAND or FLARE is not engaged.
- L1 A.FLOOR engages
  For A.FLOOR engagement conditions, Refer to DSC-22-27-20 Alpha Floor Protection.

  Note: *A.FLOOR engages regardless of the initial A/THR status, and the position of the thrust levers.*

- The A/THR is disconnected, the thrust levers are in the active range, and:
  - The AP/FD TCAS mode engages, upon a resolution advisory, or
  - The EMER DES mode engages.

  Note: *If the A/THR is disconnected with the thrust levers above the climb detent, the A/THR arms.*

- The CAS is above VMAX +5 kt in clean configuration, or VFE +9 kt when flaps or slats are extended.

Ident.: DSC-22-FG-50-30-GAACT-00005669.0001001 / 06 AUG 14

DISPLAY

When the A/THR is active:

- The FMA displays:
  - The A/THR message on the third line of the fifth column
  - The A/THR mode in green on the first line of the first column.
- The A/THR pb light is illuminated on the AFS CP.
- The Engine Display (ED) displays the thrust target.
  For more information, *Refer to DSC-70-20 Thrust Rating Mode and Thrust Limit Value*.

Ident.: DSC-22-FG-50-30-GAACT-00005670.0001001 / 28 APR 17

EFFECT OF THRUST LEVER MOVEMENT WHEN THE A/THR IS ACTIVE

A/THR TRANSITION FROM ACTIVE TO ARMED

When the A/THR is active, the A/THR becomes armed as described in the following table:

L13

Engine Condition	Thrust Lever Position
All engines are operative.	All the thrust levers are above the CL detent. Or at least one thrust lever is above the FLX-MCT detent.
One engine is out.	The thrust lever of the operative engine is above the FLX-MCT detent.

When the A/THR becomes armed, the thrust immediately increases, in accordance with the thrust lever position.

A/THR LIMITED

The A/THR limits the engine thrust at the thrust levers position when:

- Both thrust levers are set below the CL detent, and all engines are operative
- One engine is out, and the thrust lever of the operative engine is set below the FLX-MCT detent.

When the thrust is limited, the AUTO FLT A/THR LIMITED alert triggers.

L2 The AUTO FLT A/THR LIMITED alert is repeated every 5 s, until the flight crew moves the thrust levers to the CL detent or FLX-MCT detent (if one engine-out).

L1 The FMA displays THR LVR on the first line of the first column.
LVR CLB or LVR MCT flashes on the third line of the FMA.

L2 LVR CLB flashes on the FMA, when all the following conditions are applicable:
- The position of the thrust levers are not appropriate:
  - Both thrust levers are below the CL detent, or
  - One thrust lever is above CL detent
- Both engines run
- L3 The aircraft is above 100 ft
- No windshear is detected.

L2 LVR MCT flashes on the FMA, when all the following conditions are applicable:
- One engine is out
- The position of the thrust lever of the operative engine is not appropriate:
  - The thrust lever is below the MCT detent, or
  - The aircraft is above the thrust reduction altitude, and the thrust lever is above MCT
- L3 The aircraft is above 100 ft
- No windshear is detected.

L1 ASYMMETRIC THRUST LEVERS

The LVR ASYM message displays on the third line of the first column of the FMA if all the following conditions are met:
- The A/THR is armed or active
- One thrust lever is at the CL detent (if both engines are operative) or FLX-MCT detent (if only one engine is operative)
- The other thrust lever is not on the same position.

L2 This is applicable only above 100 ft.

Intentionally left blank

A/THR DISCONNECTION

Applicable to: ALL

Ident.: DSC-22-FG-50-40-A-00005671.0001001 / 03 JUL 20

1

The A/THR disconnects, if one of the following occurs:

- The flight crew presses one A/THR instinctive disconnect pushbutton

  Note: In normal operation, when the flight crew presses the A/THR instinctive disconnect pb, the engine thrust target is set to the thrust lever position.

- The flight crew sets all the thrust levers at the idle detent
- The flight crew presses the A/THR pb on the AFS CP

L2 This is applicable, if neither LAND nor FLARE is engaged.

L1 - The A/THR becomes inoperative.

L2 One of the preliminary conditions required for A/THR arming or activation is no longer applicable. For more information, *Refer to DSC-22-FG-50-30 Preliminary Conditions Required for A/THR Arming or Activation*.

L3 - Both engines are in N1 unrated mode

L1 - When the airspeed reaches VLS after an A.FLOOR activation, the A/THR disconnects, if not connected before the A.FLOOR activation.

Airbus does not recommend to use the A/THR pb to disconnect the A/THR, in normal operation.

L13

CAUTION	If the flight crew presses, and holds one A/THR instinctive disconnect pushbutton for more than 15 seconds, the A/THR will be disconnected for the remainder of the flight. All A/THR modes, including A.FLOOR will be lost. The A/THR will be recovered at the next aircraft power-up. The A/THR will be recovered, when one of the following occurs: - Five seconds after all engines shutdown - After power-up of all PRIMs and all FADECs.

Ident.: DSC-22-FG-50-40-A-00005673.0001001 / 06 AUG 14

THRUST LOCK FUNCTION

The thrust lock function activates when an A/THR involuntary disconnection occurs.
When the thrust lock function is active, the engines maintain the thrust at the value they had before the A/THR disconnected.
The engines maintain the thrust, until the flight crew moves the thrust levers.

When the thrust lock function is active, the FMA displays the flashing THR LK message on the third line of the first column. The message disappears, when the flight crew moves the thrust levers.

L2 Associated with the following alerts:
- The AUTO FLT A/THR OFF, *Refer to (procedure)*
- The ENG THRUST LOCKED, if the flight crew does not move the thrust levers within 5 s, *Refer to (procedure)*.
  The ENG THRUST LOCKED alert is inhibited during takeoff.

L1 For information on involuntary disconnection, *Refer to DSC-22-FG-50-40 Involuntary Disconnection*.

A/THR DISCONNECTION ANNUNCIATIONS AND WARNINGS

Applicable to: ALL

Ident.: DSC-22-FG-50-40-B-00005672.0001001 / 06 AUG 14

The annunciations and warnings depend on voluntary or involuntary A/THR disconnection.

Ident.: DSC-22-FG-50-40-B-00005674.0001001 / 06 AUG 14

VOLUNTARY DISCONNECTION

A voluntary disconnection occurs when:
- The flight crew presses one A/THR instinctive disconnect pushbutton, or
- The flight crew sets all the thrust levers to idle.

In the case of a voluntary disconnection:
- The A/THR OFF memo appears on the PFDs and on the WD
  L2 The maximum duration is 9 seconds.
- L1 The MASTER CAUT light comes on
  L2 The maximum duration is three seconds.
- L1 The single chime sounds.

The flight crew can press the A/THR instinctive disconnect pushbutton, or the MASTER CAUT light to clear all the associated indicators.

Note: When the aircraft is below 50 ft RA, and the flight crew sets both thrust levers to IDLE, no alert is triggered.

INVOLUNTARY DISCONNECTION

An involuntary disconnection occurs when:
- The flight crew presses the A/THR pb on the AFS CP, or
- The A/THR becomes inoperative.

L2 One of the preliminary conditions required for A/THR arming or activation is no longer applicable: *Refer to DSC-22-FG-50-30 Preliminary Conditions Required for A/THR Arming or Activation*.

L1 In the case of an involuntary disconnection:
- The A/THR OFF memo appears on the PFDs and on the WD
- The AUTO FLT A/THR OFF alert (*Refer to procedure*)
- The MASTER CAUT light comes on
- The single chime sounds
- The thrust lock function activates (*Refer to DSC-22-FG-50-40 THRUST LOCK Function*).

The flight crew can cancel the alert via:
- The A/THR instinctive disconnect pushbutton
- The MASTER CAUTION pb.

The alert also disappears, if the flight crew arms or activates the A/THR.

Intentionally left blank

GENERAL

Ident.: DSC-22-FG-50-50-00005676.0001001 / 06 AUG 14
Applicable to: ALL

When the A/THR is active, an A/THR mode is engaged.
The A/THR modes are: THRUST, SPEED/MACH and RETARD.

THRUST MODES

Applicable to: ALL

Ident.: DSC-22-FG-50-50-A-00005677.0001001 / 06 AUG 14

When the AP/FD vertical mode is SRS, OP CLB, CLB, OP DES, or DES in idle path, the A/THR is in THRUST mode.
When a THRUST mode is engaged, the A/THR commands the thrust. The thrust target depends on the THRUST mode. However, the thrust target can be limited by the thrust lever position, when the thrust levers are below the CL detent (or FLX MCT, when at least one engine is out).

Ident.: DSC-22-FG-50-50-A-00005681.0002001 / 07 MAY 18

THRUST MODE OPERATION

After takeoff, when the aircraft reaches the thrust reduction altitude, LVR CLB flashes on the FMA, asking the flight crew to set the thrust levers to the CL detent. The thrust reduction (THR RED) altitude is displayed on the T.O panel of the FMS PERF page.

L2 The thrust reduction altitude may be below, equal to, or above the ACCEL ALT. Therefore, the thrust reduction altitude can be reached when SRS TO, CLB or OP CLB is engaged.

L1 The following table presents the display conditions of the THRUST modes.

AP/FD Vertical Mode	Additional Conditions	Thrust Lever Position for	THRUST Mode (Displayed on FMA)(1)
SRS TO, CLB, or OP CLB is engaged, and the aircraft is above the thrust reduction altitude	- The aircraft is not in a Noise Abatement Departure Procedure (NADP). - Derated climb is not selected	CL, or FLX-MCT if one engine is out.	THR CLB, or THR MCT if one engine is out.
	- The aircraft is not in a Noise Abatement Departure Procedure (NADP). - A derated climb is selected - The engines apply derated climb thrust.	CL	THR DCLB
SRS TO, CLB, or OP CLB is engaged, and the aircraft is above the thrust reduction altitude	- A Noise Abatement Departure Procedure (NADP) is set. - The altitude is below the NOISE END altitude.	CL	NOISE N1 82% (2)
CLB or OP CLB is engaged, and the aircraft is above the thrust reduction altitude	- A Noise Abatement Departure Procedure (NADP) is selected. - The altitude is above the NOISE END altitude, and - The thrust goes toward the climb thrust, but the climb thrust target is not yet achieved.	CL	THR CLB*(2)
	- A Noise Abatement Departure Procedure (NADP) is selected. - The altitude is above the NOISE END altitude. - The thrust goes toward derated climb thrust, but the derated climb thrust is not yet achieved.	CL	THR DCLB* (2)

(2) *NOISE N1 xx% , THR CLB* , and THR DCLB* are not available, if one engine is out.*

Ident.: DSC-22-FG-50-50-A-00005682.0002001 / 01 JUN 17

L2 DETAILED ENGAGEMENT CONDITIONS

The following table presents the detailed engagement conditions of the THRUST modes, when the A/THR is active:

THRUST Mode (1)	**Engagement Conditions** (2)
THR CLB	All of the following conditions are applicable: - DERATED CLB is not selected on the CLB panel of the FMS PERF page - The aircraft is not in a Noise Abatement Departure Procedure (NADP), or the NADP is completed - SRS TO, CLB, OP CLB, or SRS GA is engaged - The engines apply climb thrust - The engagement conditions of THR LVR are not applicable.

Continued on the following page

Continued from the previous page

THR DCLB*	All of the following conditions are applicable: - A DERATED CLB thrust is set on the CLB panel of the FMS PERF page - A NOISE N1 thrust is set on the T.O panel of the FMS PERF page (or on the CLB panel) - The altitude is above the NOISE END altitude - One thrust lever is on the CL detent, and the other is on or below the CL detent - SRS TO, CLB, OP CLB, or SRS GA is engaged - Both engines are operative - The thrust goes toward the derated climb thrust - The engagement conditions of THR LVR are not applicable.
THR DCLB	All of the following conditions are applicable: - A DERATED CLB thrust is set on the CLB panel of the FMS PERF page - One thrust lever is on the CL detent, and the other is on or below the CL detent. - SRS TO, CLB, OP CLB, or SRS GA is engaged - The engines apply the derated climb thrust - The engagement conditions of THR LVR are not applicable.
NOISE N1 xx%	All of the following conditions are applicable: - A NOISE N1 thrust is set on the T.O panel of the FMS PERF page (or on the CLB panel) - The altitude is below the NOISE END altitude - SRS TO, OP CLB, or CLB is engaged - Both engines are operative - The engagement conditions of THR LVR are not applicable.
THR CLB*	All of the following conditions are applicable: - A NOISE N1 thrust is set on the T.O panel of the FMS PERF page (or on the CLB panel) - The altitude is above the NOISE END altitude - The thrust goes towards the climb thrust, but the climb thrust target is not yet achieved. - CLB, or OP CLB is engaged - Both engines are operative - The engagement conditions of THR LVR are not applicable.
THR DES	All of the following conditions are applicable: - DES is engaged in idle path - The FMS requests a thrust slightly higher than the idle thrust - The engagement conditions of THR LVR are not applicable.

Continued on the following page

Continued from the previous page

THR IDLE	One of the following conditions is applicable: - OP DES, EMER DES, DES in idle path, or the A/THR RETARD mode is engaged For information on the A/THR RETARD mode, *Refer to DSC-22-FG-50-50 RETARD Mode*. - The engagement conditions of THR LVR are not applicable.
THR MCT	All of the following conditions are applicable: - One engine is out - The thrust lever associated to the operative engine is on the MCT detent - SRS TO, CLB, OP CLB, or SRS GA is engaged - The engagement conditions of THR LVR are not applicable.
THR LVR	One of the following condition is applicable: - The most forward thrust lever is above MCT - Both thrust levers are below the CL detent, and SRS TO, OP CLB, CLB, or SRS GA is engaged - The most forward thrust levers is between the CL and MCT detents, and SRS TO, OP CLB, CLB, or SRS GA is engaged
A.FLOOR (with a flashing amber box)	A.FLOOR engages. For A.FLOOR engagement conditions, *Refer to DSC-22-27-20 Alpha Floor Protection*. *Note:* *A.FLOOR can engage, even if the A/THR was not previously armed, or active.*

(1) *The FMA displays the THRUST mode on the first line of the first column.*

(2) *The thrust lever position refers to the thrust lever of operative engine. The thrust lever of an inoperative engine should be at the idle detent.*

SPEED/MACH MODE

Applicable to: ALL

Ident.: DSC-22-FG-50-50-B-00005678.0001001 / 03 DEC 15

With the A/THR active, SPEED or MACH engages when one of the following AP/FD vertical mode is engaged:
- V/S/FPA
- Altitude mode: ALT*, ALT, ALT CST*, ALT CST, ALT CRZ*, ALT CRZ
- DES in geometric path
- Approach mode: G/S*, G/S, F-G/S*, F-G/S, LAND, FLARE (except when RETARD is engaged in autoland below 50 ft)
- TCAS mode engages.

If all APs and all FDs are disengaged and the A/THR is active, the A/THR is in SPEED/MACH.
When the A/THR is in SPEED/MACH, the A/THR adjusts the thrust in order to acquire and hold a speed/Mach target.
The FMA displays SPEED or MACH on the first line of the first column.

The speed/Mach target is:
- Managed, when the target comes from the FMS
  For engagement conditions of managed speed/Mach, *Refer to DSC-22-FG-60-20 Engagement Conditions*.
- Selected, when the target comes from:
  - The SPD/MACH knob of the AFS CP
  - The AFS CONTROL PANEL page of the MFD, if the flight crew activates the AFS backup function and set the SPD to SELECTED.

  For engagement conditions of selected speed/Mach, *Refer to DSC-22-FG-60-30 Engagement Conditions*

The speed/Mach target is always limited by VLS, and VMAX -5 kt. In addition, when the speed/Mach is managed, the speed/Mach does not go below the manoeuvring speed of the current slats/flaps configuration (Green Dot, F, S).
SPEED or MACH engages, in accordance with the speed/Mach switching selection: *Refer to DSC-22-FG-60-40 Speed/Mach Switching*.

Ident.: DSC-22-FG-50-50-B-00005683.0001001 / 07 MAY 18

L2 A/THR SOFT MODE

FUNCTION

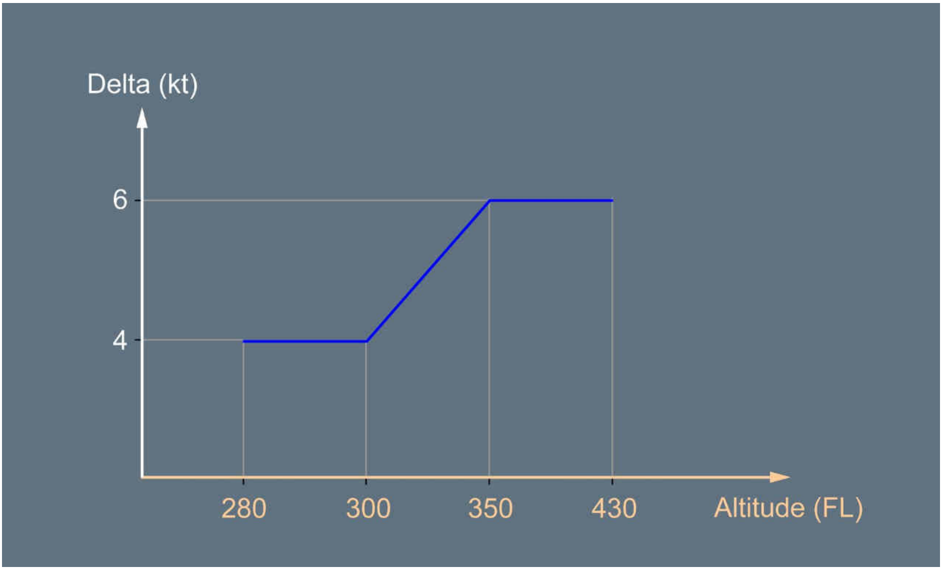
The A/THR soft mode is available when the A/THR is in SPEED/MACH. This mode reduces the thrust variation, specifically in light turbulence. The mode allows slight variation of the speed/Mach.

ACTIVATION

The A/THR soft mode activates, when all of the following conditions are applicable:
- The A/THR is in SPEED/MACH
- The AP is engaged
- ALT, ALT CST or ALT CRZ is engaged
- The aircraft is in clean configuration, the gear is up, and the speed brakes are retracted

- The aircraft is above FL280, and the Mach corresponding to the speed/Mach target is above 0.55
- The aircraft speed is not beyond the speed/Mach target + or - delta.
  However, if the speed/Mach go beyond speed/Mach target + or - delta, and returns inside speed/Mach target + or - delta in less than 30 s, then the soft mode remains engaged.
  Delta depends on the altitude, and is described as follows:

Delta



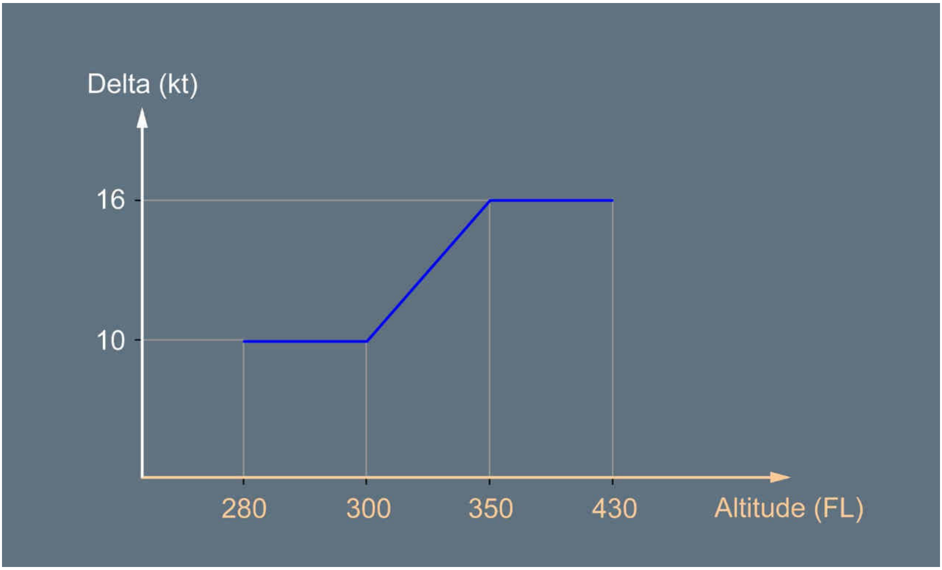
Note: There is no message to indicate that the A/THR soft mode is active.

DEACTIVATION

The A/THR soft mode deactivates, when one of the following occurs:

- One of the conditions required to activate the A/THR soft mode is no longer applicable
- The aircraft speed is greater than VMAX - 5 kt.
- The aircraft speed is beyond the speed/Mach target + or - delta for 4 s.
  Delta depends on the altitude, and is described as follows:

Delta



RETARD MODE

Ident.: DSC-22-FG-50-50-00005679.0001001 / 20 OCT 14
Applicable to: ALL

The A/THR RETARD mode is only available during automatic landing.

The RETARD mode engagement occurs as follows:

1. At least one AP is engaged. The LAND mode, and the A/THR SPEED mode are engaged.
2. FLARE engages.
3. When the aircraft reaches 50 ft RA, the A/THR RETARD mode automatically engages. The FMA displays THR IDLE. The A/THR controls thrust at idle.

4. A RETARD callout triggers at 10 ft RA, asking the flight crew to set the thrust levers to idle.
5. The flight crew sets the thrust levers to idle: The A/THR disconnects, and so RETARD disengages.

Here is an example:

RETARD Mode

L2 If the last AP disengages when RETARD is engaged, RETARD disengages, and SPEED engages.

L1 *Note:* *In manual landing, the RETARD callout triggers at 20 ft RA.*

L2 In manual or automatic landing, the RETARD callout triggers, independently of the thrust levers position.

L1 In manual or automatic landing, if the flight crew does not set the thrust levers to idle:
- The RETARD callout is repeated
- The spoilers will not extend after touchdown, and the autobrake will not activate.
  For more information ground spoiler extension, *Refer to DSC-27-10-10 Ground Spoiler Control*
  For more information on autobrake activation, *Refer to DSC-32-20-10-50 Activation of the Basic Autobrake Mode*.

A/THR MODE REVERSIONS

Applicable to: ALL

Ident.: DSC-22-FG-50-50-C-00005680.0001001 / 06 AUG 14

The following table presents the A/THR mode reversions:

L12

Initial A/THR Mode	**A/THRMode after Reversion**	**Conditions Leading to A/THR Mode Reversion**	**Warning**
THRUST	SPEED/MACH	The aircraft does not follow the speed target: - The aircraft speed is below $VLS - 2$ when DES or OP DES is engaged, or - The aircraft speed is above $VMAX + 4$ when CLB or OP CLB is engaged. *Note:* *If the FD is engaged, the FD also disengages*	A triple click audio indicator sounds. If the aircraft speed goes above $VMAX + 4$, the OVERSPEED alert triggers.
THR NOISE, or THR CLB*	THR CLB	The aircraft does not follow the speed target. The reversion occurs, when: - The aircraft speed is below VLS, or - The aircraft speed is 10 kt below the speed target, or - The flight path angle is below 0.5 °.	A triple click audio indicator sounds.
Whatever A/THR mode. The A/THR can be armed, active, or disconnected.	A.FLOOR	*Refer to DSC-22-27-20 Alpha Floor Protection*.	*Refer to DSC-22-FG-50-50 ALPHA FLOOR*.

Ident.: DSC-22-FG-50-50-C-00005684.0001001 / 08 JUL 19

ALPHA FLOOR

The α-floor protection triggers when the aircraft angle of attack is above a pre-determined threshold function of the configuration. For engagement conditions of A.FLOOR , *Refer to DSC-22-27-20 Alpha Floor Protection*.

When the α-floor protection is triggered:
- The A/THR automatically activates, independently of the previous A/THR engagement status
- The A.FLOOR A/THR mode engages, and the FMA displays A.FLOOR with a flashing amber box on the first line of the first column
- The A/THR commands TOGA thrust, regardless of the thrust lever positions
- When the airspeed reaches VLS, the A/THR mode returns to the previous A/THR active mode, if any.

CAUTION	The A.FLOOR mode will disconnect, if the flight crew manually disconnects the A/THR.

Intentionally left blank

INTRODUCTION

Ident.: DSC-22-FG-50-60-00005685.0001001 / 06 AUG 14
Applicable to: ALL

For scenario examples on A/THR:
- *Refer to DSC-22-FG-50-60 From Takeoff to Thrust Reduction Altitude*
- *Refer to DSC-22-FG-50-60 Noise Abatement Departure Procedure*
- *Refer to DSC-22-FG-50-60 From Soft Go-around to Thrust reduction Altitude*

FROM TAKEOFF TO THRUST REDUCTION ALTITUDE

Ident.: DSC-22-FG-50-60-00005686.0001001 / 13 JAN 15
Applicable to: ALL

The aircraft is on ground, and the flight crew has selected TOGA on the TO panel of the FMS PERF page.
The flight crew sets the thrust levers to TOGA: The A/THR arms, the engines apply TOGA thrust, MAN TOGA appears on the FMA, and SRS TO engages.
When the aircraft reaches the thrust reduction altitude, LVR CLB flashes, and the flight crew sets the thrust levers to CL: The A/THR activates, and THR CLB engages.

NOISE ABATEMENT DEPARTURE PROCEDURE

Ident.: DSC-22-FG-50-60-00005687.0001001 / 06 AUG 14
Applicable to: ALL

When on ground, the flight crew has performed the following selections on the TO panel of the FMS PERF page:
- TOGA
- A NOISE END altitude, a NOISE SPD, and an N1 target in the NOISE THR entry field.
  For more information on the Noise Abatement Departure Procedure, *Refer to DSC-22-FMS-10-50-60 Introduction*.

THR NOISE and THR CLB* are the A/THR modes of the Noise Abatement Departure Procedure. They engage as follows:

TOGA Thrust

FROM SOFT GO-AROUND TO THRUST REDUCTION ALTITUDE

Ident.: DSC-22-FG-50-60-00018973.0001001 / 03 DEC 15

Applicable to: ALL

The flight crew performs a soft go-around when the thrust levers are set to TOGA then to FLX-MCT detent:

1. The flight crew sets the thrust levers to the TOGA detent:
   - The A/THR arms
   - The engines thrust increases to TOGA
   - MAN TOGA appears on the FMA
   - The SRS GA vertical mode engages on the FMA
2. Then, the flight crew sets the thrust levers to the FLX-MCT detent:
   - The A/THR remains armed
   - The engines apply a computed thrust to target a vertical speed of approximately 2 000 ft/min, or TOGA if 2 000 ft/min cannot be reached

- MAN GA SOFT appears on the FMA
- The SRS GA vertical mode remains engaged

3. When the aircraft reaches the thrust reduction altitude, LVR CLB flashes, and the flight crew sets the thrust levers to the CL detent:
   - The A/THR activates
   - THR CLB appears on the FMA.

Note:
- *The soft go-around function is only available with both engines operative. Therefore, if one engine is inoperative, the flight crew must apply and keep TOGA during go-around. Then, to activate the climb phase, the flight crew must set the thrust levers to the FLX-MCT detent.*
- *If an engine failure occurs when the soft go-around function is engaged, LVR TOGA flashes on the FMA.*

GENERAL

Ident.: DSC-22-FG-60-10-00003569.0001001 / 06 AUG 14
Applicable to: ALL

The speed/Mach control is:
- Managed, when the target comes from the FMS
- Selected, when the target comes from the SPD/MACH knob on the AFS CP.

In flight, either the AP/FD or the A/THR can acquire and hold a speed/Mach target (*Refer to DSC-22-FG-10 Selected and Managed Modes*). However, managed speed/Mach control and selected speed/Mach control require that the A/THR is armed or active.

Intentionally left blank

DISPLAY

Ident.: DSC-22-FG-60-20-00003570.0001001 / 06 AUG 14
Applicable to: ALL

When the speed/Mach target is managed, the SPD/MACH window on the AFS CP displays dashes. For more information on SPD/MACH control on the AFS CP, *Refer to DSC-22-FG-90-20 SPD/MACH Window*.

When the speed is managed, the PFD indicates the associated speed/Mach target with a magenta triangle.
For more information on the speed target display on PFD, *Refer to DSC-31-CDS-40-20-40 General Airspeed Indications*.

Note: *If the managed speed target is outside the airspeed envelope, the FG limits the speed target between VLS, and* $VMAX - 5$.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-60-20-00003571.0001001 / 03 DEC 15
Applicable to: ALL

PRELIMINARY CONDITIONS

The Speed/Mach mode can be managed when one of the following conditions is applicable:
- One or two AP is engaged, or
- The FD is engaged, or
- The flight phase of the FMS is the approach phase, or
- F-G/S, G/S, LAND, FLARE, or ROLL OUT is engaged.

ENGAGEMENT OF THE MANAGED SPEED/MACH

In addition to preliminary conditions, the speed/Mach becomes managed, if one of the following occurs:
- On ground, when V2 is inserted on the T.O panel of the FMS PERF page
- SRS TO or SRS GA engages

  Note: *At takeoff, SRS will not engage, if V2 is not available.*

- In flight, the flight crew presses the SPD/MACH knob on the AFS CP, and a managed speed/Mach target is available.
  For more information on the SPD/MACH knob, *Refer to DSC-22-FG-90-20 SPD/MACH Knob*.

If all the APs and FD are off, the managed speed/Mach is only available when the flight phase of the FMS is the approach phase, The A/THR is then in SPEED mode.

L2 Note: *if the flight crew inserts a speed/Mach on the DES panel of the FMS PERF page to replace the ECON DES SPD or MACH, the speed target is still managed.*
For more information on the ECON DES SPD or MACH, Refer to DSC-22-FMS-10-50-30 DES.

MANAGED SPEED/MACH TARGET

Ident.: DSC-22-FG-60-20-00003572.0001001 / 03 DEC 15
Applicable to: ALL

When speed/Mach is managed, the target is defined as follows:

L2 For managed speed/Mach, the lowest target is VLS, and the highest target is VMAX -5 kt.

L123

AP/FD Engaged Mode or FMS Flight Phase	Managed Speed/Mach Target
SRS TO is engaged, and the aircraft is on ground.	V2 If V2 is lost, the managed speed target remains engaged, and equals V2, because the PRIMs memorize the target value at SRS TO engagement.
SRS TO is engaged, and the aircraft is airborne.	V2 + 10 kt Note: *However, the magenta triangle appears on the V2 value, on the PFDs.* If V2 is lost by the FMS, the managed speed target remains engaged, and equals V2 + 10 kt, because the PRIMs memorizes the target value at SRS TO engagement.
SRS TO is engaged, and one engine is out.	Memorized aircraft speed at engine-out detection. The target value is limited by V2 and V2 + 15 kt.
SRS GA is engaged.	Memorized aircraft speed at SRS GA engagement. The lower limit of the target is the VAPP that the PRIMs memorize at 700 ft RA. The higher limit of the target is the lowest value between: - VLS + 25 kt (or VLS + 15 kt in engine-out) - VMAX - 5 kt.

Continued on the following page

Continued from the previous page

- The FMS flight phase is the approach phase In this case, the AP(s) and/or FDs may be on or off Or - F-G/S, G/S, LAND, FLARE or ROLL OUT is engaged	VAPP, corrected from the Ground Speed Mini function *Refer to DSC-22-FG-60-20 Introduction*. Before reaching the landing configuration, the speed will not go below: - Green Dot, in clean configuration - S, in CONF 1 - F, in CONF 2 - F, in CONF 3, when CONF FULL is the landing configuration (as defined in the APPR panel of the FMS PERF page). Note: *When the managed speed target is limited by Green Dot, S, or F, the short-term managed speed appears. The FG uses the short-term managed speed as the current speed/Mach target.* *For more information on the short-term managed speed, Refer to DSC-22-FG-60-20 Short-Term Managed Speed.* The PRIMs memorize the VAPP at 700 ft RA, so if the FMS loses the VAPP below 700 ft RA, the managed speed target will still be computed. The lower limit of the managed speed target is the VAPP that is computed by the FMS, and displayed on the MFD. If the VAPP computed by the FMS is not available, the VAPP is VLS +5. The higher limit of the managed speed target is the VFE NEXT (or VFE - 5 kt in full configuration) of the landing configuration.
For All other cases	The managed speed/Mach target is provided by the FMS: - If NAV is engaged, the managed speed/Mach target will be defined by the speed/Mach profile of the FMS flight plan. All the speed/Mach constraints are taken into account. - If NAV is not engaged, the managed speed/Mach target will be defined by the speed/Mach profile of the FMS flight plan. But the speed/Mach constraints are not taken into account. For information on the speed/Mach profile, *Refer to DSC-22-FG-60-20 FMS Speed/Mach Target*. Note: *The managed speed/Mach target may exceed the flight envelope limits, or the maneuvering speed of the current slats/flaps configuration: The short-term managed speed then appears. The FG uses the short-term managed speed as the current speed/Mach target.* *For more information on the short-term managed speed, Refer to DSC-22-FG-60-20 Short-Term Managed Speed.*

GROUND SPEED MINI FUNCTION

Applicable to: ALL

Ident.: DSC-22-FG-60-20-A-00003573.0001001 / 06 AUG 14

When the aircraft flies an approach in managed speed, the managed speed target, displayed by the magenta triangle on the PFDs, is variable. This managed speed target is VAPP, displayed on the APPR panel of the FMS PERF page, and corrected by the Ground Speed Mini function.

Ident.: DSC-22-FG-60-20-A-00003578.0001001 / 08 JUL 19

GROUND SPEED MINI FUNCTION PRINCIPLE

The Ground Speed Mini function takes advantage of the aircraft inertia, when the wind varies during the approach in order to provide an adequate indicated speed target (i.e. the managed speed target represented by the magenta triangle). When the aircraft flies this indicated speed target, the energy of the aircraft is maintained above a minimum level ensuring standard aerodynamic margins versus stall.
The minimum energy level is the energy level the aircraft will have at touchdown with an indicated airspeed equal to VAPP, and with the wind equal to the tower reported wind as inserted on the APPR panel of the FMS PERF page. The ground speed then equals the Ground Speed Mini.

L2 Ground Speed Mini = VAPP - TOWER HEADWIND COMPONENT

For definition of the TOWER HEADWIND COMPONENT, *Refer to DSC-22-FG-60-20 Managed Speed Target Computation*.

L1 The Ground Speed Mini is not displayed to the flight crew.

During the approach, the FG continuously computes the managed speed target, in order to keep the ground speed at, or above the Ground Speed Mini.

Ident.: DSC-22-FG-60-20-A-00003579.0001001 / 03 DEC 15

L2 MANAGED SPEED TARGET COMPUTATION

The computation of the managed speed target uses the tower headwind component, the current headwind component, and the VAPP.

TOWER HEADWIND COMPONENT

Based on weather airport information, the flight crew enters the MAG WIND on the APPR panel of the FMS PERF page.
The FMS computes the tower headwind component (HD) that is a projection of the MAG WIND on the runway axis. The HD is displayed on the APPR panel of the FMS PERF page.
For more information about FMS WIND entry, *Refer to DSC-22-FMS-20-20-20 Wind Data*.

CURRENT HEADWIND COMPONENT

The projection of the current wind measured by the ADIRS on the aircraft longitudinal axis is the current headwind component (instantaneous headwind).

VAPP

The FMS computes the VAPP, and displays it on the APPR panel of the FMS PERF page.
The VAPP computation takes into account the tower headwind component.
For more information about VAPP computation, *Refer to DSC-22-27-10-20 VAPP*.
The flight crew can modify the VAPP.

MANAGED SPEED TARGET COMPUTATION

The FG continuously computes the managed speed target that is equal to VAPP plus an additional variable gust:
Managed speed target = VAPP + computed gust
The computed gust takes into account a part of the current headwind component and the tower headwind component. The computed gust has a limit of 0, as a minimum value.
L3 Managed speed target = VAPP + 0.3 * (CURRENT HEADWIND COMPONENT - TOWER HEADWIND COMPONENT)

L2 The managed speed target has the following limits:
- VAPP, as the minimum value
- VFE NEXT, in configuration 0, 1, 2, 3, VFE - 5 kt in configuration full, as the maximum value.

FMS SPEED/MACH TARGET

Ident.: DSC-22-FG-60-20-00003574.0001001 / 13 JAN 15
Applicable to: ALL

The FMS speed/Mach targets are used to define the speed/Mach profile.
For information on the speed/Mach profile, *Refer to DSC-22-FMS-10-50-30 Speed/Mach Profiles*.
In the following table, the first column indicates the FMS speed/Mach targets, and the second column indicates where the FMS speed/Mach targets are displayed:

FMS Speed/Mach Target	FMS PERF Page
V2 NOISE SPD	T.O Panel
NOISE SPD CLB SPD LIM SPD CSTR ECON LRC RTA HOLD SPD If one engine is out: - EO-GDOT - EO-ECON - EO-LRC.	CLB Panel
ECON RTA LRC CMS SPD LIM HOLD SPD If one engine is out: - EO-ECON - EO-LRC.	CRZ Panel

Continued on the following page

Continued from the previous page

FMS Speed/Mach Target	**FMS PERF Page**
ECON RTA *Note:* *When the FMS flight phase is the descent phase, and the DES mode is engaged, the FG does not accurately maintain the ECON speed/Mach (or RTA speed/Mach). However, the managed speed/Mach should not go beyond the high and low speed margins.*  *ach margin is indicated by two dashes on the PFD airspeed* *cale.* *For more information on high and low speed margins, Refer to DSC-22-FMS-10-50-30 DES.* SPD CSTR HOLD SPD DES SPD LIM	DES Panel

SHORT-TERM MANAGED SPEED

Ident.: DSC-22-FG-60-20-00003575.0001001 / 03 DEC 15
Applicable to: ALL

The short-term managed speed may appear when the speed/Mach is either managed, or selected. This speed is indicated by a magenta dot on the PFD airspeed scale.

WHEN THE SPEED/MACH IS MANAGED

The short-term managed speed appears, when the managed speed/Mach target exceeds the flight envelope limits, or the maneuvering speed of the current slats/flaps configuration:

If the managed speed/Mach target is:	**Then, the short-term managed speed is equal to:**
Above VMAX-5 (e.g. VFE-5: VFE in high-lift configuration, with the gear up, when the aircraft is climbing)	VMAX-5

Continued on the following page

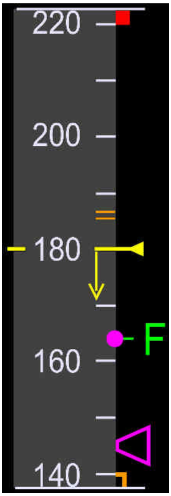
Continued from the previous page

Below VLS	VLS
Below the maneuvering speed of the current slats/flaps configuration: Green Dot, S, F This occurs, for example: - In approach, or - When the aircraft flies a holding pattern, and the HOLD speed is below green dot.	Green Dot, S, F

L2 The short-term managed speed is inhibited when:
- The FMS flight phase is cruise, or
- The DES or APP-DES mode is engaged and the short term managed speed is beyond the low or high speed targets.

L3 *Note:* *The short-term managed speed only appears, if the difference between the short-term managed speed, and the managed speed/Mach target (i.e. magenta triangle) is equal to, or higher than 2 kt.*

L1 The FG uses the short-term managed speed, as the current speed/Mach target.
Thus, when the speed/Mach is managed, the FG always uses a speed/Mach target that is limited by VLS, and VMAX-5.
The following illustration of the PFD airspeed scale provides an example of the short-term managed speed when speed/Mach is managed:



The aircraft is in approach, in CONF 2. The managed speed target is VAPP. The short-term managed speed is F.
F is the current speed target.

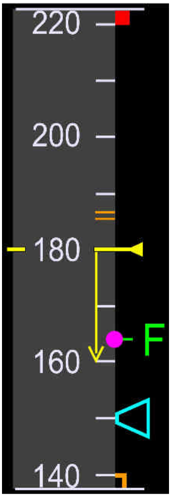
WHEN THE SPEED/MACH IS SELECTED

The short-term managed speed is the speed/Mach target, that would be used if the flight crew engages the managed speed/Mach control.

L3 *Note:* *When the aircraft is in the deceleration segment toward a hold speed, or speed limit, the short-term managed speed is the managed ECON speed, and not the hold speed, or the speed limit.*

L1 The following illustrations of the PFD airspeed scale provide examples of the short-term managed speed when speed/Mach is selected:

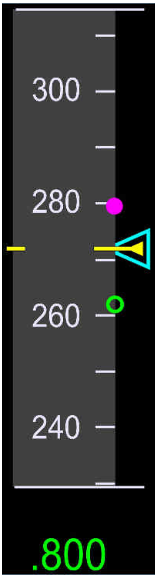
EXAMPLE 1



The aircraft is in approach, in CONF 2, and the selected speed target is 150 kt. The short-term managed speed is F.

At this moment, if the flight crew engages the managed speed control:
- The managed speed target would be VAPP
- The short-term managed speed would remain equal to F
- The current speed target would be F.

EXAMPLE 2



The aircraft is in cruise, the selected Mach target is M 0.8, and the ECON Mach is M 0.82. The short-term managed speed is the ECON Mach.
At this moment, if the flight crew engages the managed Mach control, the managed Mach target would be the ECON Mach (i.e.M 0.82).

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-60-20-00003576.0001001 / 06 AUG 14
Applicable to: ALL

The speed/Mach is no longer managed, if one of the following occurs:
- The flight crew pulls the SPD/MACH knob on the AFS CP to select a speed/Mach target
- The flight crew preselected a speed/Mach on the CLB or CRZ panel of the FMS PERF page, and the associated FMS flight phase engages

- The managed speed/Mach target is lost

L2 This is not applicable, if one of the following conditions is applicable:

- SRS TO or SRS GA is engaged
- LAND or FLARE is engaged
- ROLL OUT is engaged
- L3 LAND is armed below 700 ft RA.

L1 If the managed speed/Mach target is lost, the speed/Mach target reverts to selected, and becomes equal to the current aircraft speed/Mach.

- All APs and FDs disengage, and the FMS flight phase is not the approach phase.
  The speed/Mach target becomes selected, and equal to the current aircraft speed/Mach.

Intentionally left blank

DISPLAY

Ident.: DSC-22-FG-60-30-00005688.0001001 / 06 AUG 14
Applicable to: ALL

When a speed/Mach target is selected, the SPD/MACH window on the AFS CP displays the target.

The PFD airspeed scale indicates the selected speed target with a blue triangle.
When the Mach is selected, the PFD displays the associated speed target on the airspeed scale.
For more information on the speed target display on PFD, *Refer to DSC-31-CDS-40-20-40 General Airspeed Indications*.

Note: *The selected speed target can be outside the airspeed envelope. However, the FG limits the speed target between VLS, and* $VMAX - 5$.

SELECTED SPEED/MACH PRIORITY

Ident.: DSC-22-FG-60-30-00005689.0001001 / 06 AUG 14
Applicable to: ALL

Selected speed has priority over managed speed. The only automatic change from selected to managed speed/Mach target occurs at go-around engagement.

When in selected speed/Mach, if the situation calls for managed speed/Mach, then both PFDs and both MFDs display a message, that proposes a manual change to managed speed or Mach:

- SET HOLD SPD, when the aircraft enters a holding pattern
- CHECK SPD MODE, when:
  - The FMS flight phase becomes cruise, and a speed/Mach presel is not defined for the cruise phase
  - The aircraft sequences the start waypoint of a Constant Mach Segment (CMS)
  - The FMS flight phase becomes descent.
- SET EO SPD SETTING when in engine-out, and the speed selected on the AFS CP is 10 kt away from EO green dot.
  This message asks the flight crew to change the selected speed, in order to select a speed near the EO green dot, or to engage managed speed/Mach control.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-60-30-00005690.0002001 / 01 JUN 17
Applicable to: ALL

The speed/Mach target becomes selected, if one the following occurs:

- The flight crew pulls the SPD/MACH knob on the AFS CP in flight
  For more information on the SPD/MACH knob , *Refer to DSC-22-FG-90-20 SPD/MACH Knob*.
- The flight crew has preselected a speed/Mach on the CLB or CRZ panel of the FMS PERF page, and the associated FMS flight phase engages
  The SPD/MACH window on the AFS CP will display the selected speed/Mach target.
- TCAS engages due to a resolution Advisory (RA)
- ALT* engages following the EMER DES mode disengagement.
  The selected speed becomes Green Dot speed brakes deployed.
- The managed speed/Mach target is lost, and reverts to selected
  For more information, *Refer to DSC-22-FG-60-20 Disengagement Conditions*.
- All AP(s) and FDs disengage, and the FMS flight phase is not the approach phase, and no vertical approach mode is engaged
  The selected speed/Mach target becomes the current aircraft speed/Mach.
- 5 s after liftoff, if the speed target is not managed.
  The selected speed target becomes the current aircraft speed at liftoff.

L2 *Note:* *The SPD/MACH window, and the blue triangle on the PFD airspeed scale display this new speed target.*

L1 *Note:* *The selected speed/Mach target is always limited by VLS, and by VMAX -5 kt .*

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-60-30-00005691.0001001 / 06 AUG 14
Applicable to: ALL

The selected speed/Mach target disengages, if one of the following occurs:

- The speed/Mach target becomes managed
- L3 On ground, the FDs engage
- On ground, the engines starts, while the FDs are engaged
- On ground, the engines starts and all the FMS are fault.

FMS FLIGHT PLAN PREDICTIONS WHEN IN SELECTED SPEED/MACH

Ident.: DSC-22-FG-60-30-00005692.0001001 / 02 OCT 14
Applicable to: ALL

In most cases, when the speed/Mach is selected, the FMS flight plan predictions consider that the speed/Mach remains selected, until the next SPD LIM, SPD CSTR, or the next phase, whichever comes first, and then the speed/Mach becomes managed.
For more information, *Refer to DSC-22-FMS-10-40-70 Selected Speed/Mach*.

Intentionally left blank

SPEED/MACH SWITCHING

Ident.: DSC-22-FG-60-40-00005693.0001001 / 06 AUG 14
Applicable to: ALL

Speed/Mach switching can be automatic, or manual.

AUTOMATIC SWITCHING

During climb, when the crossover altitude is reached, the speed target (selected or managed) changes automatically to the associated Mach target.
During descent, when the crossover altitude is reached, the Mach target (selected or managed) changes automatically to the associated speed target.
The crossover altitude is at approx. 30 000 ft. It is based on the ECON MACH value.

MANUAL SWITCHING

When the speed/Mach is selected, the flight crew can perform the switching, by pressing the SPD/MACH pb on the AFS CP (For more information on the SPD/MACH pb, *Refer to DSC-22-FG-90-20 SPD/MACH pb*).

Intentionally left blank

AP/FD MODES GENERAL

Applicable to: ALL

Ident.: DSC-22-FG-70-10-GAPF-00005694.0001001 / 06 AUG 14

The AP/FD modes are either lateral, vertical, or common.

Ident.: DSC-22-FG-70-10-GAPF-00005696.0001001 / 03 JUL 20

1 AP/FD LATERAL MODES

The AP/FD lateral modes are:

FMA	AP/FD Lateral Modes
RWY, RWY TRK	Runway mode, Runway track mode
NAV	Navigation mode
HDG, TRACK	Heading mode, Track mode HDG and TRACK are the lateral basic modes.
LOC*, LOC	Localizer capture mode, Localizer track mode
LOC B/C *, LOC B/C	Localizer back course capture mode, Loc back course track mode
F-LOC*, F-LOC	Flight Management System Landing System Localizer capture mode, Flight Management System Landing System Localize track mode
GA TRK	Go-around track mode

L2 BANK ANGLE LIMITATION

The following limitations apply when the AP is engaged. However, if the AP is not engaged, the FD orders respect the bank angle limitations.
In addition to the bank angle limitation, there is a bank angle protection. For more information, *Refer to DSC-22-27-20 Bank Angle Protection*.

WHEN ALL ENGINE OPERATIVE

AP/FD Lateral Mode	Bank Angle Limitation
HDG, TRACK	Bank Angle Limitation NAV	Function of the TAS, the maximum is 30°.
LOC*, LOC B/C*, F-LOC*	30 °
LOC, LOC B/C, F-LOC, LAND, FLARE, GA TRK	8 °

WHEN ONE ENGINE IS INOPERATIVE

AP/FD Lateral Mode	Bank Angle Limitation
HDG, TRACK	The bank angle limitation is the minimum of the following ones: 1. Between 19 ° and 25 ° depending on the TAS:  2. Between 15 ° and 25 ° depending on the CAS and the aircraft configuration:  Vm is the manoeuvring speed. Vm depends on the aircraft configuration, and is equal to: - Green Dot in CONF 0 - S in CONF 1, 1+F - F in CONF 2, 3 - VLS in CONF FULL.
NAV	Function of the TAS, the maximum is 30°.
LOC*, LOC B/C*, F-LOC*	30 °
LOC, LOC B/C, F-LOC, LAND, FLARE, GA TRK	8 °

Ident.: DSC-22-FG-70-10-GAPF-00005697.0002001 / 01 JUN 17

AP/FD VERTICAL MODES

The AP/FD vertical modes are:

FMA	**AP/FD Vertical Modes**
SRS	Speed Reference System mode, used during takeoff and go-around SRS TO refers to SRS mode during takeoff, and SRS GA refers to SRS mode during go-around.
CLB	Climb mode
DES	Descent mode
OP CLB	Open climb mode
OP DES	Open descent mode
EMER DES	Emergency Descent mode
V/S, FPA	Vertical Speed mode, Flight Path Angle mode V/S and FPA are the vertical basic modes.
ALT*, ALT *(1)*	Altitude capture mode, Altitude hold mode
ALT CST*, ALT CST *(1)*	Altitude constraint capture mode, altitude constraint hold mode
ALT CRZ* , ALT CRZ *(1)*	Altitude capture of the cruise flight level, altitude hold of the cruise flight level
G/S*, G/S	Glide slope capture mode, glide slope track mode
F-G/S*, F-G/S	FLS-G/S capture mode, FLS-G/S track mode
APP-DES	Vertical approach descent mode
TCAS	TCAS vertical mode of a Resolution Advisory (RA)

(1) *ALT*, ALT CST*, and ALT CRZ* are referred to as the altitude acquire modes.*
ALT, ALT CST, and ALT CRZ are referred to as the altitude hold modes.

Ident.: DSC-22-FG-70-10-GAPF-00005698.0001001 / 06 AUG 14

AP/FD COMMON MODES

The AP/FD common modes are:

FMA	**AP/FD Common Modes**
LAND	Land mode
FLARE	Flare mode
ROLL OUT	Rollout mode

AP/FD MODE STATUS AND DISPLAY

Ident.: DSC-22-FG-70-10-00005695.0001001 / 06 AUG 14
Applicable to: ALL

AP/FD MODE STATUS

An AP/FD lateral or vertical mode can be armed, engaged, or disengaged.
An AP/FD common mode can either be engaged or disengaged.
When all APs and FDs disengage, all AP/FD modes disengage.
L2 On ground, at engine start, all AP/FD modes disengage.

L1 AP/FD MODE DISPLAY

The FMA displays the AP/FD modes.
When an AP/FD lateral mode is armed, the FMA displays the lateral mode in blue, on the second line of the third column. When an AP/FD lateral mode is engaged, the FMA displays the lateral mode in green, on the first line of the third column.
When an AP/FD vertical mode is armed, the FMA displays the vertical mode in blue, on the second line of the second column. When an AP/FD vertical mode is engaged, the FMA displays the vertical mode in green, on the first line of the second column.
When an AP/FD common mode is engaged, the FMA displays the common mode in green, on the first line of the second and third columns. When an AP/FD common mode is disengaged, the FMA does not display the mode.
When an AP/FD lateral or vertical mode disengages, the FMA does not display the disengaged mode.

Intentionally left blank

General

GENERAL

Ident.: DSC-22-FG-70-20-10-00005699.0001001 / 06 AUG 14
Applicable to: ALL

At takeoff, the Speed Reference System (SRS) vertical mode, and the runway (RWY) lateral mode simultaneously engage. They disengage at different moment.
In some cases, when airborne, the RWY mode can change to another lateral takeoff mode: the runway track RWY TRK mode.

For scenario examples on takeoff:

- *Refer to DSC-22-FG-70-110-20 Takeoff with NAV*
- *Refer to DSC-22-FG-70-110-20 Takeoff with HDG/TRK Preset*.

Intentionally left blank

SRS TO Mode

GENERAL

Ident.: DSC-22-FG-70-20-30-00005700.0001001 / 03 DEC 15
Applicable to: ALL

The Speed Reference System (SRS) mode is a managed vertical mode. This mode is used during takeoff, and during go-around.
This chapter only describes the SRS mode during takeoff, also referred to as the SRS TO mode. The FMA announces the SRS TO mode with the SRS indication.
The SRS TO controls the speed via the elevators, in order to steer the aircraft along a vertical path.

L2 The guidance law also includes:
- A flight path angle protection, that ensures a positive climb
- A pitch angle protection to reduce the aircraft nose-up (15 ° of maximum pitch attitude)
- A speed protection, that ensures the aircraft does not exceed VFE.

L1 When the aircraft is on ground, V2 is the speed target. When the aircraft is airborne, V2+10 kt becomes the speed target. If one engine fails, the speed target is the current aircraft speed at the engine failure detection. However, the speed target is limited by V2 and V2+15 kt. For more information on the speed target, *Refer to DSC-22-FG-60-20 Managed Speed/Mach Target*.
In main cases, SRS TO disengages at the acceleration altitude: CLB or OP CLB engages.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-20-30-00005701.0001001 / 06 AUG 14
Applicable to: ALL

SRS TO engages, when all of the following conditions are applicable:
- The aircraft is on ground
  L3 The aircraft must be on ground for at least 30 s.
- L1 V2 is inserted on the T.O panel of the PERF page of the FMS
  L2 Or, the three FMCs are fault. In this case, V2 will be equal to the speed target of the AFS CP.
- L1 The slats or the flaps are extended
- The flight crew sets at least one thrust lever:
  - To the TOGA detent, or
  - To the FLX-MCT detent, when FLX or DERATED is selected on the T.O panel of the PERF page of the FMS.

Note: *When V2 is inserted, or SRS TO is engaged, the speed automatically becomes managed. For more information about engagement conditions of managed speed, Refer to DSC-22-FG-60-20 Engagement Conditions.*

For scenario examples:
- *Refer to DSC-22-FG-70-110-20 Takeoff with NAV*, step 2
- *Refer to DSC-22-FG-70-110-20 Takeoff with HDG/TRK Preset*, step 2.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-20-30-00005702.0001001 / 03 DEC 15
Applicable to: ALL

SRS TO mode disengages, when one of the following occurs:

- CLB or OP CLB is armed, and the aircraft reaches the acceleration altitude
  CLB or OP CLB engages.
- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
  L3 This scenario is applicable, if the aircraft is above 400 ft RA.
- L1 NAV is engaged, and the aircraft reaches the capture zone of the altitude constraint
  ALT CST* engages.
  L3 This scenario is applicable, if the aircraft is above 400 ft RA.
- L1 The flight crew presses the ALT pb
  ALT engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT knob, and all of the following conditions are applicable:
  - NAV is engaged
  - The AFS CP selected altitude is above the aircraft altitude
  - L3 The vertical flight plan is valid.

  L1 CLB engages.
- The flight crew pulls or push the V/S / FPA knob.
  V/S / FPA engages.

REVERSION

SRS TO reverts to OP CLB, when the AFS CP selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob. The triple click audio indicator sounds.

RWY Mode

GENERAL

Ident.: DSC-22-FG-70-20-40-00005703.0001001 / 03 DEC 15
Applicable to: ALL

The Runway (RWY) mode is a managed lateral mode.
When the LOC signal is available, the RWY mode gives lateral guidance orders during takeoff, and initial climb.

L2 The RWY guidance law aims to maintain the aircraft on the runway centerline during the takeoff run.
When the aircraft is airborne, the RWY guidance law aims to maintain the sideslip indicator centered.
To follow the guidance, the FD displays the yaw bar order.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-20-40-00005704.0001001 / 09 MAR 16
Applicable to: ALL

RWY arms, when the aircraft approaches the runway threshold.

L3 RWY arms, when all of the following conditions are applicable:
- An ILS(GLS ◁)(SLS ◁) is set, associated to the takeoff runway, and the difference between the LS course and the runway heading, as inserted in the flight plan, is less than 2 °.
- The aircraft is on ground (for more than 120 s)
- The slats or the flaps are extended
- The LOC is valid
- The flight crew did not select a LOC B/C approach in the flight plan
- The aircraft heading reaches 115 ° of the ILS course
- The LOC deviation reaches one dot, and decreases.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-20-40-00005705.0001001 / 09 MAR 16
Applicable to: ALL

L3 RWY disarms, when one of the following occurs:
- The flaps lever is set to 0
- The LOCis invalid
- The RWY engages
- The flight crew selected a LOC B/C approach in the flight plan

- The ILS(GLS ◁)(SLS ◁) course is no longer equal to the runway heading, as defined is the flight plan
- The aircraft becomes airborne.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-20-40-00005706.0001001 / 09 MAR 16
Applicable to: ALL

RWY engages, if all of the following conditions are applicable:

- L3 The aircraft is on ground (for more than 30 s)
- The slats are extended (flaps lever is not in the 0 detent)
- The LOC is valid
- L2 The LOC deviation below 0.5 dot
- L3 The aircraft heading is within 20 ° of the ILS(GLS ◁)(SLS ◁) course
- The difference between the ILS(GLS ◁)(SLS ◁) course and the runway heading, as defined in the FMS database, is less than 2 °.
- No lateral mode is already engaged
- L1 The flight crew sets a thrust lever to:
  - The TOGA detent, if TOGA is selected on the T.O panel of the PERF page of the FMS, or
  - The FLX-MCT detent, if FLEX or DERATED is selected on the T.O panel of the PERF page of the FMS.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-20-40-00005707.0001001 / 09 MAR 16
Applicable to: ALL

RWY disengages, if one of the following occurs:

- NAV is armed, and the aircraft reaches 30 ft RA
  NAV engages.
- L2 NAV is not armed, and the aircraft reaches 50 ft RA
  RWY TRK engages.
- L1 The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- L3 The aircraft heading deviates from more than 20 degrees from the ILS(GLS ◁)(SLS ◁) course.

RWY TRK Mode

GENERAL

Ident.: DSC-22-FG-70-20-50-00005708.0001001 / 03 DEC 15
Applicable to: ALL

The Runway Track (RWY TRK) mode is a managed lateral mode.
The RWY TRK mode guides the aircraft along a constant track target. The track target is the aircraft track at RWY TRK engagement.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-20-50-00005709.0001001 / 06 AUG 14
Applicable to: ALL

The RWY TRK automatically engages at 50 ft RA, if:

L3 - The FMS flight phase is takeoff, and

L1 - NAV is not engaged.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-20-50-00005710.0001001 / 06 AUG 14
Applicable to: ALL

RWY TRK disengages, when one of the following occurs:
- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- NAV is armed, and the aircraft reaches the capture zone of the active leg
  NAV engages.
- The flight crew inserts a DIRECT TO.
  NAV engages.

Intentionally left blank

General

GENERAL

Ident.: DSC-22-FG-70-30-10-00004501.0001001 / 06 AUG 14
Applicable to: ALL

The Heading (HDG), TRACK and Navigation (NAV) modes guides the aircraft laterally. They are mainly used during climb, cruise and descent.

Intentionally left blank

HDG/TRACK Mode

GENERAL

Ident.: DSC-22-FG-70-30-20-00004502.0001001 / 06 AUG 14
Applicable to: ALL

Heading (HDG) and TRACK are selected lateral modes. They are the basic modes of lateral guidance.
HDG/TRACK guides the aircraft laterally along the heading/track target, that appears in the HDG/TRK window on the AFS CP. For more information on the HDG/TRK window, *Refer to DSC-22-FG-90-20 HDG/TRK Window*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-30-20-00004503.0003001 / 01 JUN 17
Applicable to: ALL

HDG/TRACK engages, when one of the following occurs:

- The flight crew pulls the HDG/TRK knob on the AFS CP in flight

L3 This is applicable, if:
- The aircraft is in flight, for at least 5 s after liftoff
- Not in LAND, FLARE, or ROLL OUT
- Not in GA TRK below 100 ft RA.

L1 For more information on the HDG/TRK knob, *Refer to DSC-22-FG-90-20 HDG/TRK Window*.

- NAV is engaged and the flight crew engages a direct CRS IN, or CRS OUT in the flight plan

L3 This is not applicable if the aircraft is below 700 ft in LOC, or F-LOC mode.

L1
- EMER DES mode engages
- All AP and FDs were previously off, and the flight crew engages the AP or the FDs

Note: *1. The AP or FDs engage in basic modes: HDG/TRACK, and V/S /FPA.*
2. If the FD engages, the FD bars flash for 10 s.

L2
- The flight crew presses the APPR pb, or the LOC pb to off, when the approach mode is armed.

L3
- RWY is engaged and the aircraft deviates from the ILS course for more than 20 °.

L1
- LOC*, LOC, LOC B/C*, or LOC B/C is engaged in a LOC only approach mode, and the flight crew presses the LOC pb to off.

HDG or TRACK engages, in accordance with the HDG-V/S / TRK-FPA selection: *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection*.

REVERSION TO HDG/TRACK

The HDG/TRACK also engages when one of the following reversion occurs:

- NAV disengages:
  L3
  - The flight plan becomes invalid

    Note: *This occurs for example, when:*
    - *The FMS aircraft position is lost, or*
    - *The ground speed is invalid.*

    For more information, *Refer to DSC-22-FG-70-30-30 Disengagement Conditions*.

  L1
  - The aircraft reaches a flight plan discontinuity
  - The NAV mode fails
  - The EMER DES mode engages

  L2
  For more information, *Refer to DSC-22-FG-70-60-40 Engagement Conditions*.

L3
- The approach is modified in the flight plan, when LOC*, LOC, F-LOC*, F-LOC, LOC B/C*, or LOC B/C is engaged
  HDG/TRACK, and V/S / FPA engage.

  Note: *1. If the approach is modified, when one of the above approach modes is armed, the approach mode will disarm. HDG/TRACK will not engage.*
  2. Below 700 ft RA, it is not possible to modify the approach, if:
  - *LOC is armed or engaged, with G/S armed or engaged*
  - *LOC is armed or engaged, with F-G/S armed or engaged*
  - *F-LOC is armed or engaged, with F-G/S armed or engaged.*

L1
- LOC*, LOC, F-LOC*, F-LOC, LOC B/C*, or LOC B/C is lost after a failure occurs in approach (*Refer to DSC-22-FG-40-30 Automatic Disengagement*)
  All AP(s) disengage. The FDs reverts in HDG/TRACK, and V/S / FPA.

When a reversion occurs:

- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

L12

Note: *If a managed vertical mode was previously engaged, a selected vertical mode engages:*
- *If CLB was engaged, OP CLB engages*
- *If ALT CST*, ALT CRZ*, or DES was engaged, V/S / FPA engages*
- *If ALT CST was engaged, ALT engages.*

HDG-V/S / TRK-FPA SELECTION

Ident.: DSC-22-FG-70-30-20-00004504.0001001 / 06 AUG 14
Applicable to: ALL

The flight crew can press the HDG-V/S / TRK-FPA pb on the AFS CP to change from one selection to another.
At the aircraft power-up, the HDG-V/S / TRK-FPA selection is set to HDG-V/S by default.

When HDG-V/S is selected:
- HDG appears on the HDG/TRK window of the AFS CP
  For more information on the HDG/TRK window, *Refer to DSC-22-FG-90-20 HDG/TRK Window*.
- V/S appears on the V/S / FPA window of the AFS CP
  For more information on the V/S / FPA window, *Refer to DSC-22-FG-90-20 V/S / FPA Window*.
- HDG and/or V/S mode(s) can be engaged
- TRACK and FPA modes cannot be engaged
- If the VV pb is pressed on the EFIS CP, the associated PFD displays the Velocity Vector (VV) in black.
  For more information on the VV, *Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector*.

When TRK-FPA is selected:
- TRK appears on the HDG/TRK window of the AFS CP
- FPA appears on the V/S / FPA window of the AFS CP
- HDG and/or V/S mode(s) cannot be engaged
- TRACK and FPA modes can be engaged
- Both PFDs display the Flight Path Vector (FPV) in green.
  For more information on the FPV , *Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector*.

HDG/TRK PRESET

Ident.: DSC-22-FG-70-30-20-00004505.0001001 / 03 DEC 15
Applicable to: ALL

The flight guidance has a HDG/TRK preset function for takeoff and go-around.
If the flight crew decides not to fly the flight plan after a takeoff or go-around, the flight crew can turn the HDG/TRK knob on the AFS CP to preset a heading or a track.

AT TAKEOFF

If the flight crew presets the HDG/TRK before takeoff and up to 30 ft RA, NAV disarms. The preset value remains displayed in the HDG/TRK window (even when RWY TRK engages at 50 ft RA).
When the flight crew pulls the HDG/TRK knob (at least 5 s after liftoff), HDG or TRACK engages. The aircraft follows the preset target.

AT GO-AROUND

If the flight crew presets the HDG/TRK when LOC*, LOC, F-LOC*, F-LOC, LAND, FLARE, ROLL OUT or GA TRK is engaged, the preset value remains displayed in the HDG/TRK window, as long as one of these modes is engaged.
After go-around engagement, HDG/TRACK will engage, when the flight crew pulls the HDG/TRK knob.

L3 This is applicable, if the flight crew pulls the HDG/TRK knob above 100 ft RA.

L1 When the HDG or TRACK engages, the heading/track target is the HDG/TRK preset.

CANCELLATION

The flight crew can cancel a HDG/TRK preset with one of the following action:
- The HDG/TRK knob is pushed
- A DIR TO is selected in the FMS
- The AP and FDs are disengaged.

HEADING/TRACK TARGET

Ident.: DSC-22-FG-70-30-20-00004506.0001001 / 06 AUG 14
Applicable to: ALL

When HDG/TRACK engages, the heading/track target is defined as followed:

Conditions of Engagement	Target
The flight crew pulls the HDG/TRK knob.	The heading/track selected with the HDG/TRACK knob, or the HDG/TRK preset.
For all other cases.	The current heading or track of the aircraft. *Note:* *The HDG/TRK window automatically displays this target at HDG/TRACK engagement.*

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-30-20-00004507.0001001 / 06 AUG 14
Applicable to: ALL

HDG/TRACK disengages, when another lateral mode engages.

NAV Mode

GENERAL

Ident.: DSC-22-FG-70-30-30-00004508.0001001 / 06 AUG 14
Applicable to: ALL

The Navigation (NAV) mode is a managed lateral mode, that guides the aircraft laterally along the FMS flight plan. It is designed to have a zero crosstrack error.
NAV usually arms before engaging.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-30-30-00004509.0001001 / 03 DEC 15
Applicable to: ALL

L2 For NAV arming, the lateral flight plan must be available.

L1 NAV arms, when one of the following occurs:
- The aircraft is on ground, and the flight crew does not preset a HDG/TRK for takeoff.
- The flight crew pushes the HDG/TRK knob on the AFS CP
- The flight crew activates a DIR TO - CRS IN or a DIR TO - CRS OUT with the FMS. For more information on DIR TO, *Refer to DSC-22-FMS-10-40-20 Purpose*.
- The flight crew initiates a go-around.
  L2 This is not applicable if HDG, or a TRK is preset.
  For more information about NAV arming in the case of go-around, *Refer to DSC-22-FG-70-90-10 General*.
- L1 The flight crew presses the APPR pb and the conditions to arm the APP-DES mode are applicable.

L3 However, NAV cannot arm, if one of the following modes is engaged: LOC*, LOC, F-LOC*, F-LOC, LOC B/C*, LOC B/C, LAND, FLARE, ROLL OUT.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-30-30-00004510.0001001 / 03 DEC 15
Applicable to: ALL

L2 NAV disarms, when one of the following occurs:
- The flight crew presets a HDG/TRK for takeoff
- L3 NAV engages
- The flight crew pulls the HDG/TRK knob

L2 - The flight crew arms or engages an approach mode, except if the APP-DES mode can be armed
L3 - The flight plan becomes invalid.
For more information, *Refer to DSC-22-FG-70-30-30 Disengagement Conditions*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-30-30-00004511.0001001 / 06 AUG 14
Applicable to: ALL

For NAV engagement, the lateral flight plan must be available.

NAV engages, if one of the following occurs:
- NAV is armed, and the aircraft reaches 30 ft RA after takeoff
- NAV is armed, and the aircraft reaches the capture zone of the flight plan active leg
- The flight crew activates a DIR TO (DIRECT, or DIRECT WITH ABEAM) on the MFD
L3 This is not applicable, if LOC*, LOC, F-LOC*, F-LOC, LOC B/C* or LOC B/C, LAND, FLARE, ROLL OUT is engaged below 700 ft RA.
L1 - The flight crew initiates a go-around above 100 ft RA, and the aircraft reaches the capture zone of the flight plan active leg.
L2 This is not applicable if a HDG/TRK was preset.
For more information about NAV engagement in go-around, *Refer to DSC-22-FG-70-90-10 General*.

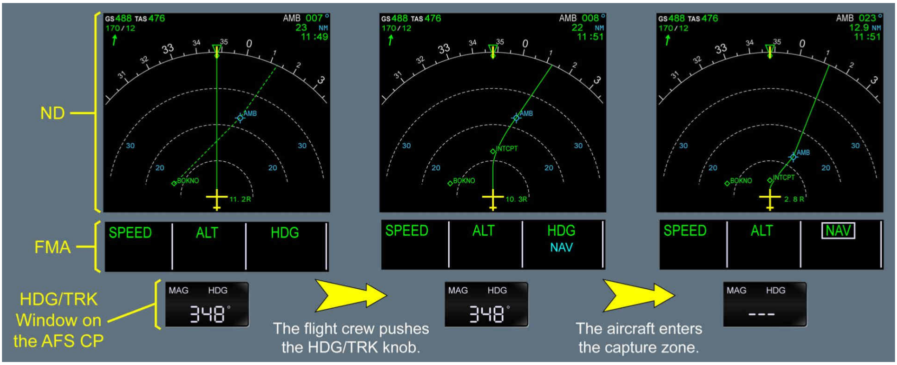
L1 When NAV is engaged, the HDG/TRK window on the AFS CP displays dashes.

CAPTURE ZONE OF THE FLIGHT PLAN ACTIVE LEG

When NAV is armed, it automatically engages, if:
- The aircraft track line intercepts the flight plan between the FROM and the TO waypoints
- The intercept waypoint (INTCPT) is displayed on the ND
- The aircraft reaches the capture zone of the flight plan active leg.

The following is an example:

Capture Zone



ND
FMA

The flight crew pushes the HDG/TRK knob.

The aircraft enters the capture zone.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-30-30-00004512.0001001 / 03 DEC 15
Applicable to: ALL

NAV disengages, when another lateral mode engages.
NAV disengages, when HDG, TRK, LOC*, F-LOC*, LOC B/C* , or GA TRK engages.

L2 REVERSION

NAV disengages, and reverts to the HDG/TRACK mode when:

- The aircraft reaches a flight plan discontinuity
- The flight plan becomes invalid.

L3 This occurs when for example:

- The FMS aircraft position is lost, or
- The ground speed is invalid.

L2 When a reversion occurs:

- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

Note: *When the lateral mode reverts to HDG/TRACK, the vertical mode also reverts to a vertical selected mode.*

For more information about the reversion to HDG/TRACK, *Refer to DSC-22-FG-70-30-20 Engagement Conditions*.

INTERACTIONS WITH VERTICAL MODES

Ident.: DSC-22-FG-70-30-30-00004513.0001001 / 06 AUG 14
Applicable to: ALL

When NAV is engaged with the managed vertical modes CLB or DES, the guidance takes into account the altitude and speed constraints, linked to waypoints on the lateral flight plan.
When NAV disengages, the managed vertical modes are not available and the altitude constraints are disregarded.

General

GENERAL

Ident.: DSC-22-FG-70-40-10-00005807.0001001 / 06 AUG 14
Applicable to: ALL

During climb, OP CLB or CLB guides the aircraft vertically to an altitude target.
V/S / FPA can also climb the aircraft: *Refer to DSC-22-FG-70-70 General*.

Intentionally left blank

OP CLB Mode

GENERAL

Ident.: DSC-22-FG-70-40-20-00005808.0001001 / 06 AUG 14
Applicable to: ALL

Open Climb (OP CLB) mode is a selected vertical mode.
OP CLB guides the aircraft vertically to the AFS CP selected altitude. All altitude constraints are disregarded.

When OP CLB is engaged:
- OP CLB controls the speed/Mach target (selected or managed)
- If the A/THR is active, the A/THR will control the thrust.

OP CLB usually arms before it engages.

For scenario examples on climb with OP CLB mode:
- *Refer to DSC-22-FG-70-110-30 At the Acceleration Altitude*
- *Refer to DSC-22-FG-70-110-30 The Flight Crew Pulls the ALT Knob*
- *Refer to DSC-22-FG-70-110-30 NAV Disengages*

OP CLB ASSOCIATION WITH ALTITUDE MODES

Ident.: DSC-22-FG-70-40-20-00005809.0001001 / 06 AUG 14
Applicable to: ALL

OP CLB is always associated to an altitude mode.
When OP CLB is engaged:

Conditions	**The FMA displays the following message on the second line of the second column:**
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set to the cruise altitude.	ALT (ALT is armed)
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. *Note:* *The cruise altitude is defined on the CRZ panel of the FMS PERF page.*	ALT CRZ (ALT CRZ is armed)

ARMING CONDITIONS

Ident.: DSC-22-FG-70-40-20-00005810.0001001 / 06 AUG 14
Applicable to: ALL

OP CLB arms, when all of the following conditions are applicable:
- The aircraft is on ground, or SRS is engaged (TO or GA)
- NAV is neither armed nor engaged, or the vertical flight plan is not available
- The Acceleration (ACC) altitude is available, and is below the AFS CP selected altitude.

Refer to DSC-22-FG-70-110-30 At the Acceleration Altitude, step 1.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-40-20-00005811.0001001 / 03 DEC 15
Applicable to: ALL

L2 OP CLB disarms, when one of the following occurs:
- V/S/FPA or OP CLB engages
- L3 The ACC altitude becomes equal to, or above the AFS CP selected altitude
- CLB arms.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-40-20-B-00005812.0001001 / 06 AUG 14

OP CLB engages, when one of the following occurs:
- The AFS CP selected altitude is above the aircraft altitude, and the flight crew pulls the ALT knob

L3 This scenario is applicable, if:
  - LAND or FLARE is not engaged
  - If SRS GA is engaged, the aircraft is above 100 ft RA
  - The aircraft is airborne for at least 5 s.

- L1 SRS is engaged (TO or GA) with OP CLB armed, and the aircraft reaches the ACC altitude

L3 This scenario is applicable, if the aircraft is airborne for at least 5 s.

- L2 SRS is engaged (TO or GA), and the flight crew pulls the SPD/MACH knob.

L3 This scenario is applicable, if:
  - The AFS CP selected altitude is above the aircraft altitude
  - If SRS GA is engaged, the aircraft is above 100 ft RA
  - The aircraft is in flight for at least 5 s.

L1 When OP CLB engages, ALT automatically arms.

Ident.: DSC-22-FG-70-40-20-B-00005814.0001001 / 06 AUG 14

REVERSIONS

OP CLB also engages, when one of the following reversions occurs:
- CLB and NAV are engaged, and NAV disengages
  Refer to DSC-22-FG-70-110-30 NAV Disengages.
- L3 CLB is engaged, and the vertical flight plan becomes invalid
- CLB is engaged, and the FMS flight phase changes to the descent or approach phase
- L1 SRS TO, or SRS GA is engaged, the AFS CP selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob.

The reversion is announced by a triple click audio indicator.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-40-20-00005813.0001001 / 03 DEC 15
Applicable to: ALL

OP CLB disengages, when another vertical mode engages.

L2 OP CLB disengages, when one of the following occurs:

- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude
  ALT CRZ* engages.
- The flight crew pushes the ALT knob, when:
  - NAV is engaged
  - The vertical flight plan is available
  - L3 The FMS flight phase is neither the descent nor the approach phase.

  L2 CLB engages.
- The flight crew pulls or pushes the V/S / FPA knob to engage V/S/FPA
- The flight crew pushes the ALT pb to engage ALT.

L1 REVERSION

OP CLB reverts to V/S/FPA, when the flight crew sets the AFS CP selected altitude below the aircraft altitude.

When a reversion occurs:

- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

CLB Mode

GENERAL

Ident.: DSC-22-FG-70-40-30-00005815.0001001 / 06 AUG 14
Applicable to: ALL

Climb (CLB) mode is a managed vertical mode.
CLB guides the aircraft vertically along the FMS flight plan, to the AFS CP selected altitude, or to the next altitude constraint, whichever comes first. Therefore, altitude constraints, associated with applicable waypoints, are taken into account.
CLB can only be engaged, when NAV is engaged.

When CLB is engaged:
- The AP/FDs controls the speed/Mach target (selected or managed) through the elevators

  Note: *The Flight Guidance system does not adjust the speed/Mach target to match the altitude constraints.*

- If the A/THR is active, the A/THR will control the thrust.

CLB usually arms before it engages.

For scenario examples on climb with CLB mode:
- *Refer to DSC-22-FG-70-110-40 At the Acceleration Altitude*
- *Refer to DSC-22-FG-70-110-40 Climbing toward an Altitude Constraint*.

CLB ASSOCIATION WITH ALTITUDE MODES

Ident.: DSC-22-FG-70-40-30-00005816.0001001 / 06 AUG 14
Applicable to: ALL

CLB is always associated to an altitude mode.
When CLB is engaged:

Conditions	The FMA displays the following message on the second line of the second column:
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set to the cruise altitude. However, the AFS CP selected altitude can be equal to an altitude constraint.	ALT (ALT is armed)
The next altitude target is an altitude constraint, and the AFS CP selected altitude is above the altitude constraint.	ALT (ALT CST is armed)
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. *Note:* *The cruise altitude is defined on the CRZ panel of the FMS PERF page.*	ALT CRZ (ALT CRZ is armed)

ARMING CONDITIONS

Ident.: DSC-22-FG-70-40-30-00005817.0001001 / 06 AUG 14
Applicable to: ALL

CLB arms, when the aircraft is on ground, or when SRS is engaged (TO or GA) and:
- NAV is armed, or engaged
- The Acceleration (ACC) altitude is available, and is below:
  - The AFS CP selected altitude
  - The next altitude constraint.
- L2 The altitude set on the AFS CP is above the current altitude
- The vertical flight plan is available.

L1 *Refer to DSC-22-FG-70-110-30 At the Acceleration Altitude*, step 1.

L2 CLB also arms, when CLB was previously engaged, and ALT CST* engages. This scenario is possible, when the AFS CP selected altitude is set to be above the altitude constraint. *Refer to DSC-22-FG-70-110-40 Climbing toward an Altitude Constraint*, steps 1 and 2.

L1 The ACC altitude is displayed on the T.O and GA panel of the FMS PERF page. The flight crew can modify the ACC altitude. For more information, *Refer to DSC-22-FMS-20-20-20 THR RED Entry Field [T.O/CLB]*, and *Refer to DSC-22-FMS-20-20-20 ACCEL Entry Field [T.O/CLB]*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-40-30-00005818.0001001 / 06 AUG 14
Applicable to: ALL

CLB disarms, when one of the following occurs:
- NAV disarms, or NAV disengages
- L2 The flight crew sets the AFS CP target altitude at or below the altitude constraint, when ALT CST* or ALT CST is engaged
- OP CLB, or V/S /FPA engages

L3
- The ACC altitude becomes equal to, or above, the subsequent target altitude, when the aircraft is on ground, or when SRS is engaged (TO or GA)
- The AFS CP selected altitude is set to be below the aircraft altitude
- The vertical flight plan becomes invalid
- The FMS flight phase changes to the descent or approach phase.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-40-30-00005819.0001001 / 03 DEC 15
Applicable to: ALL

CLB engages, when one of the following occurs:

L2
- For CLB engagement, all the following conditions are applicable:
  - NAV is engaged
  - The FMS flight phase is neither the descent nor the approach phase
  - The vertical flight plan is valid
  - The aircraft is in flight for at least 5 s.

L1
- SRS is engaged (TO or GA) with CLB armed, and the aircraft reaches the ACC altitude
  Refer to DSC-22-FG-70-110-40 At the Acceleration Altitude, step 3.
- ALT CST is engaged with CLB armed, and the aircraft sequences the altitude constraint
  Refer to DSC-22-FG-70-110-40 Climbing toward an Altitude Constraint, step 4.
- The AFS CP selected altitude is set to be above the aircraft altitude, and the flight crew pushes the ALT knob.
  This scenario is applicable if CLB is not yet armed.

L2
Note: *If the aircraft altitude is within the capture zone of the AFS CP selected altitude, CLB will immediately disengage, and ALT* will engage.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-40-30-B-00005820.0001001 / 06 AUG 14

CLB disengages, when another vertical mode engages.

L2
This signifies that CLB disengages, when one of the following occurs:
- The aircraft reaches the capture zone of the AFS CP selected altitude: ALT* engages
- The aircraft reaches the capture zone of the altitude constraint: ALT CST* engages
  Refer to DSC-22-FG-70-110-40 Climbing toward an Altitude Constraint, step 2.
- The aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages
- The flight crew pulls the V/S / FPA knob to engage V/S/FPA

- The flight crew pulls the ALT knob to engage ALT
- NAV disengages.
  OP CLB engages.
  However, in some cases, this scenario is a reversion: *Refer to DSC-22-FG-70-40-30 Reversions*.

Ident.: DSC-22-FG-70-40-30-B-00005821.0001001 / 06 AUG 14

REVERSIONS

CLB also disengages, when one of the following reversions occurs:

- NAV disengages when:
  - The aircraft reaches a flight plan discontinuity, or
  - The next altitude target is an altitude constraint, and the flight crew engaged the HDG/TRACK mode.

  OP CLB engages.
  Refer to DSC-22-FG-70-110-30 NAV Disengages.
- The flight crew sets the AFS CP selected altitude below the aircraft altitude
  V/S/FPA engages on the current vertical speed or current flight path angle.
- The vertical flight plan becomes invalid
  OP CLB engages.
- L3 The FMS flight phase changes to the descent or approach phase.
  OP CLB engages.

L1 When a reversion occurs:

- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

Intentionally left blank

General

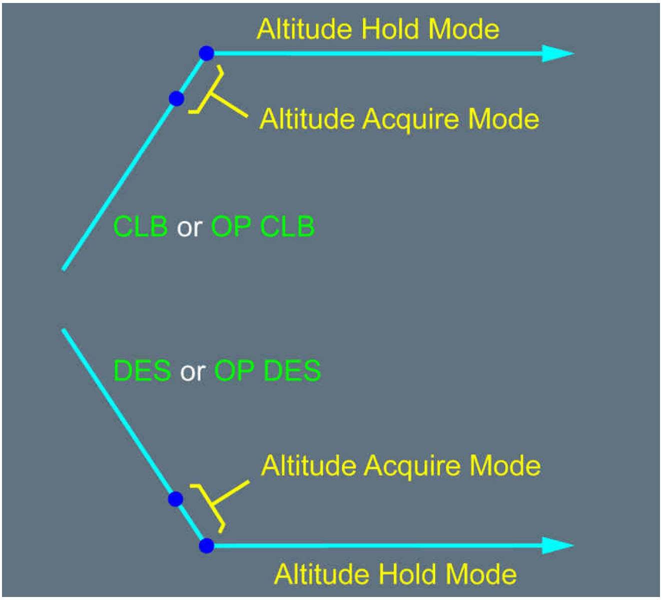
GENERAL

Applicable to: ALL

Ident.: DSC-22-FG-70-50-10-A-00005822.0001001 / 13 JAN 15

When climbing (descending) toward an altitude target, CLB or OP CLB (DES or OP DES) is engaged. When approaching the altitude target, an altitude acquire mode engages. When reaching the altitude target, an altitude hold mode engages.

ALT acquire mode, and ALT hold mode



The altitude target is one of the following: An altitude constraint (associated to a waypoint), the cruise altitude, the AFS CP selected altitude.
The altitude acquire mode is one of the following: ALT*, ALT CST*, ALT CRZ*.
The altitude hold mode is one of the following: ALT, ALT CST, ALT CRZ.

For scenario examples on altitude acquire and altitude hold:

- *Refer to DSC-22-FG-70-110-60 CLB and ALT - Example 1*
- *Refer to DSC-22-FG-70-110-60 CLB and ALT - Example 2*
- *Refer to DSC-22-FG-70-110-60 CLB and ALT CST*

- *Refer to DSC-22-FG-70-110-60 CLB and ALT CRZ*
- *Refer to DSC-22-FG-70-110-60 OP CLB and ALT*
- *Refer to DSC-22-FG-70-110-60 OP CLB and ALT CRZ*.

Ident.: DSC-22-FG-70-50-10-A-00005823.0001001 / 06 AUG 14

WHEN THE VERTICAL GUIDANCE IS MANAGED

When the vertical guidance is managed, CLB or DES guides the aircraft toward the next altitude target.

The next altitude target is the first altitude among the following that the aircraft will reach:
- The AFS CP selected altitude
- The altitude constraint (associated to a waypoint)
- The cruise altitude.

The altitude acquire mode, and the altitude hold mode are as follows:

Conditions	**Altitude Acquire Mode**	**Altitude Hold Mode**	**Scenario Example**
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set to the cruise altitude. However, the AFS CP selected altitude can be equal to an altitude constraint.	ALT*	ALT	*Refer to DSC-22-FG-70-110-60 CLB and ALT - Example 1*, and *Refer to DSC-22-FG-70-110-60 CLB and ALT - Example 2*.
The next altitude target is an altitude constraint, and the AFS CP selected altitude is above (below) the altitude constraint in climb (descent).	ALT CST*	ALT CST	*Refer to DSC-22-FG-70-110-60 CLB and ALT CST*.
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. *Note:* 1. *The cruise altitude is defined on the CRZ panel of the FMS PERF page. For more information on the cruise altitude, Refer to DSC-22-FMS-20-20-20 CRZ Entry Field.* 2. *If the AFS CP selected altitude is set above the cruise altitude, the cruise altitude is automatically updated to the AFS CP selected altitude.*	ALT CRZ*	ALT CRZ	*Refer to DSC-22-FG-70-110-60 CLB and ALT CRZ*.

Ident.: DSC-22-FG-70-50-10-A-00005824.0001001 / 06 AUG 14

WHEN THE VERTICAL GUIDANCE IS SELECTED

When the vertical guidance is selected, OP CLB or OP DES guides the aircraft toward the AFS CP selected altitude.
All the altitude constraints are disregarded.
The altitude acquire mode, and the altitude hold mode are as follows:

Conditions	**Altitude Acquire Mode**	**Altitude Hold Mode**	**Scenario Example**
The AFS CP selected altitude is below the cruise altitude.	ALT*	ALT	*Refer to DSC-22-FG-70-110-60 OP CLB and ALT.*
The AFS CP selected altitude is equal to the cruise altitude. *Note:* 1. *The cruise altitude is defined on the CRZ panel of the FMS PERF page. For more information on the cruise altitude, Refer to DSC-22-FMS-20-20-20 CRZ Entry Field.* 2. *If the AFS CP selected altitude is set above the cruise altitude, the cruise altitude is automatically updated to the AFS CP selected altitude.*	ALT CRZ*	ALT CRZ	*Refer to DSC-22-FG-70-110-60 OP CLB and ALT CRZ.*

Intentionally left blank

Altitude Acquire Modes

GENERAL

Ident.: DSC-22-FG-70-50-20-00005825.0001001 / 06 AUG 14
Applicable to: ALL

The altitude acquire mode is one of the following: ALT*, ALT CST*, ALT CRZ*.
ALT* mode guides the aircraft to acquire the AFS CP selected altitude.
ALT CST* guides the aircraft to acquire an altitude constraint.
ALT CRZ* guides the aircraft to acquire the cruise altitude, as selected on the FMS PERF page, and on the AFS CP.
When the aircraft reaches the altitude target, the altitude hold mode (ALT, ALT CST, or ALT CRZ) engages.

ARMING AND DISARMING CONDITIONS

Ident.: DSC-22-FG-70-50-20-00005826.0001001 / 03 DEC 15
Applicable to: ALL

The ALT* altitude acquire mode (respectively ALT CST* and ALT CRZ*) and the altitude hold mode ALT (respectively ALT CST and ALT CRZ) mode arms and disarms simultaneously. As a result, ALT* (respectively ALT CST* and ALT CRZ*) arms with the ALT (respectively ALT CST and ALT CRZ) indication on the FMA.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-50-20-00005827.0001001 / 05 DEC 17
Applicable to: ALL

The altitude acquire mode engages when all the following conditions are applicable:
- The altitude hold mode is engaged
- The aircraft reaches the capture zone of the altitude target.

L3 The altitude acquire mode can engage only when the aircraft is in flight for more than 5 s.

L2 ALT* and ALT CST* engagement is inhibited during 3 s after the selected altitude is changed on the AFS CP.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-50-20-00005828.0001001 / 03 DEC 15
Applicable to: ALL

The altitude acquire mode disengages, when one of the following occurs:
- The aircraft reaches the altitude target
  The altitude hold mode engages.
- The aircraft reaches the glideslope capture zone, when:
  - LOC or LOC* is engaged, and
  - G/S is armed.

  G/S* engages.
- The aircraft reaches the F-glideslope capture zone, when:
  - F-LOC, F-LOC*, LOC or LOC* is engaged, and
  - F-G/S is armed.

  F-G/S* engages.
- The aircraft reaches the APP-DES capture zone, when:
  - NAV is engaged
  - APP-DES is armed

  APP-DES engages.
- The flight crew pulls or pushes the V/S / FPA knob
  V/S / FPA engages.
- The flight crew engages go-around.
  SRS GA engages.

ADDITIONAL SCENARIO: ALT* DISENGAGEMENT (REVERSION)

ALT* disengages, if the flight crew sets the AFS CP selected altitude out of the capture zone. V/S / FPA engages.

When a reversion occurs:
- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

ADDITIONAL SCENARIOS: ALT CST* DISENGAGEMENT

ALT CST* disengages, when one of the following occurs:
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb.
  ALT engages.

REVERSIONS

ALT CST* reverts to V/S / FPA, when one of the following occurs:
- NAV disengages
- The vertical flight plan is lost.

When a reversion occurs:
- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

ADDITIONAL SCENARIOS: ALT CRZ* DISENGAGEMENT

ALT CRZ* disengages, when one of the following occurs:
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb.
  ALT engages.

REVERSION

ALT CRZ* reverts to V/S / FPA if NAV disengages.

When a reversion occurs:
- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

GUIDANCE

Ident.: DSC-22-FG-70-50-20-00005829.0001001 / 06 AUG 14
Applicable to: ALL

The altitude acquire mode has a V/S control law that is function of the difference between aircraft altitude and the altitude target.
In the case of a traffic advisory, the V/S is automatically adjusted to reach the target altitude, in order to avoid spurious resolution advisories.

Intentionally left blank

Altitude Hold Modes

GENERAL

Ident.: DSC-22-FG-70-50-30-00005830.0001001 / 06 AUG 14
Applicable to: ALL

The altitude hold mode is one of the following: ALT, ALT CST, ALT CRZ.
The altitude hold mode maintains a target altitude. This target altitude is either the AFS CP selected altitude, or an altitude constraint.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-50-30-00005831.0001001 / 06 AUG 14
Applicable to: ALL

The altitude hold mode arms, when the aircraft climbs or descends toward an altitude target.
However, the altitude hold mode do not arm, when one of the following mode is engaged: G/S*, G/S, F-G/S*, F-G/S, APP-DES, LAND, FLARE, ROLL OUT.

L3 The altitude hold can arm, if one of the following condition occurs:
- The flight crew changes the altitude target on the AFS CP
- The FD or the AP engages, and none of them was previously engaged
- The difference between the aircraft altitude and the altitude set on the AFS CP is more than 250 ft.

L1 ALT ARMING

ALT arms, when one of the following occurs:
- OP CLB engages, and the AFS CP selected altitude is not set to the cruise altitude
- OP DES engages
- CLB engages, when the next altitude target is:
  - Equal to the AFS CP selected altitude
  - Not equal to the cruise altitude.
- DES engages, and the next altitude target is the AFS CP selected altitude
- V/S / FPA engages, and the next altitude target is the AFS CP selected altitude
- SRS TO or SRS GA engages, and the altitude target set on the AFS CP is above the current aircraft altitude.

ALT CST ARMING

ALT CST arms, when CLB (DES) engages, and:
- The next target altitude is an altitude constraint
- The AFS CP selected altitude is above (below) the altitude constraint.

ALT CRZ ARMING

ALT CRZ arms, when one of the following occurs:
- CLB is engaged and the AFS CP selected altitude is set to the cruise altitude, when the cruise altitude becomes the next altitude target
- ALT is armed, and the AFS CP selected altitude is set to the cruise altitude.

FMA MESSAGE

The following table presents the FMA message, when an altitude hold mode is armed:

Conditions on Altitude *(1)*	**The armed altitude hold mode is:**	**The FMA displays the following message on the second line of the second column:**
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set to the cruise altitude. However, the AFS CP selected altitude can be equal to an altitude constraint.	ALT	ALT
All of the following conditions are applicable: - The next altitude target is an altitude constraint - CLB (DES) is engaged, and the AFS CP selected altitude is above (below) the altitude constraint.	ALT CST	ALT
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. *Note: The cruise altitude is defined on the CRZ panel of the FMS PERF page.*	ALT CRZ	ALT CRZ

(1) *The overall conditions of altitude hold mode arming are presented above.*

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-50-30-00005832.0001001 / 03 DEC 15
Applicable to: ALL

The altitude hold mode disarms when the associated altitude acquire mode engages, or when G/S* engages, or F-G/S*, or APP-DES engages.

L2 The altitude hold mode disarms in the other following cases.

ALT DISARMING

ALT disarms, when one of the following occurs:

- ALT CST arms
  This occurs when: OP CLB (OP DES) is engaged, with the AFS CP selected altitude set above (below) the altitude constraint, and CLB (DES) engages.
- L3 SRS GA engages and the AFS CP selected altitude is below the current aircraft altitude.

L2 ALT CST DISARMING

ALT CST disarms, when one of the following occurs:

- CLB or DES is engaged, and the AFS CP selected altitude becomes the next altitude target
- CLB is engaged, and OP CLB or V/S / FPA engages
- DES is engaged, and OP DES or V/S / FPA engages
- L3 DES is engaged, and SRS GA engages.

L2 ALT CRZ DISARMING

ALT CRZ disarms, when the AFS CP selected altitude is set below the cruise altitude: ALT arms.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-50-30-00005833.0001001 / 03 DEC 15
Applicable to: ALL

The altitude hold mode engages, when the altitude acquire mode is engaged, and the aircraft reaches the altitude target.

L2 The aircraft is at the altitude target when the difference between the aircraft altitude and the altitude target is less than 40 ft for more than two seconds.

L3 The altitude hold modes can only engage, if the aircraft is in flight for more than 5 s.

L1 ADDITIONAL SCENARIOS: ALT ENGAGEMENT

ALT engages, when one of the following occurs:

- The flight crew presses the ALT pb.
  L3 This scenario is not possible, if one of the following modes is engaged: LAND, FLARE, SRS GA below 100 ft RA.
- L1 ALT CST is engaged, and the flight crew sets the AFS CP selected altitude to the altitude constraint
- L2 ALT CST is engaged, and NAV disengages
- L3 ALT CST engaged, and the vertical flight plan is lost.

L2 ADDITIONAL SCENARIOS: ALT CST ENGAGEMENT

ALT CST engages, when one of the following occurs:

- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - ALT is engaged
  - The aircraft altitude is equal to the altitude constraint
  - The AFS CP selected altitude is set above the aircraft altitude
    L3 The AFS CP selected altitude is at least 250 ft above the aircraft altitude.
  - L2 NAV is engaged
  - The FMS flight phase is neither descent, nor approach
  - L3 The vertical flight plan is valid.

  L2 CLB arms.
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - ALT is engaged
  - The aircraft altitude is equal to the altitude constraint
  - The AFS CP selected altitude is set below the aircraft altitude
    L3 The AFS CP selected altitude is at least 250 ft below the aircraft altitude.
  - L2 One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C
  - The FMS flight phase is not one of the following: Takeoff, climb, go-around.

  DES arms.

L3 ADDITIONAL SCENARIOS: ALT CRZ ENGAGEMENT

ALT CRZ engages, when:

- ALT is engaged, and
- The aircraft altitude is equal to the AFS CP selected altitude, and
- The flight crew sets the cruise altitude to the aircraft altitude.

The aircraft is at the cruise altitude if all the following are applicable:

- The difference between the aircraft altitude and the target altitude on the AFS CP is less than 100 ft
- The difference between the target altitude on the AFS CP and the CRZ altitude that is set in the PERF page of the FMS is less than 20 ft.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-50-30-GDISE-00005834.0001001 / 03 DEC 15

COMMON SCENARIOS

The altitude hold mode disengages, when any other vertical modes engages.

The altitude hold mode disengages, when one of the following occurs:

- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew pulls or pushes the V/S / FPA knob
  V/S / FPA engages.
- The aircraft reaches the glideslope capture zone, when:
  - LOC* or LOC is engaged, and
  - G/S is armed.

  G/S* engages.
- The aircraft reaches the F-glideslope capture zone, when:
  - LOC*, LOC, F-LOC*, F-LOC is engaged, and
  - F-G/S is armed.

  F-G/S* engages.
- The flight crew engages go-around.
  SRS GA engages.
- The aircraft reaches the APP-DES capture zone, when:
  - NAV is engaged, and
  - APP-DES is armed.

  APP-DES engages.

Ident.: DSC-22-FG-70-50-30-GDISE-00005835.0001001 / 03 DEC 15

ADDITIONAL SCENARIOS: ALT DISENGAGEMENT

ALT disengages, when one of the following occurs:

- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The AFS CP selected altitude is above the aircraft altitude
  - NAV is engaged
  - L3 The vertical flight plan is valid
  - L1 The FMS flight phase is neither descent, nor approach.

  CLB engages.
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The AFS CP selected altitude is below the aircraft altitude
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C
  - L3 The vertical flight plan is valid
  - L1 The FMS flight phase is not one of the following: Takeoff, climb, go-around.

  DES engages.

L2 - The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The aircraft altitude is equal to the altitude constraint
  - The AFS CP selected altitude is set above the aircraft altitude

L3 The AFS CP selected altitude is at least 250 ft above the aircraft altitude.

L2
  - NAV is engaged
  - The FMS flight phase is neither descent, nor approach

L3
  - The vertical flight plan is valid.

L2 ALT CST engages.

- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The aircraft altitude is equal to the altitude constraint
  - The AFS CP selected altitude is set below the aircraft altitude

L3 The AFS CP selected altitude is at least 250 ft below the aircraft altitude.

L2
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C
  - The FMS flight phase is not one of the following: Takeoff, climb, go-around.

ALT CST engages.

L3 - The aircraft altitude is equal to the AFS CP selected altitude, and the flight crew sets the cruise altitude to the aircraft altitude
ALT CRZ engages.

Ident.: DSC-22-FG-70-50-30-GDISE-00005836.0001001 / 04 MAY 16

ADDITIONAL SCENARIOS: ALT CST DISENGAGEMENT

ALT CST disengages, when one of the following occurs:

- The aircraft sequences the waypoint, for which the altitude constraint is associated
- NAV disengages
  ALT engages.

L3 - The vertical flight plan is lost

L1 - The flight crew sets the AFS CP selected altitude to the altitude constraint
ALT engages.

- The flight crew deletes the altitude constraint.
  CLB or DES engages.

Ident.: DSC-22-FG-70-50-30-GDISE-00005837.0001001 / 03 DEC 15

ADDITIONAL SCENARIOS: ALT CRZ DISENGAGEMENT

ALT CRZ disengages, when the AFS CP selected altitude is below the aircraft altitude, and the flight crew pushes the ALT knob.
DES engages.

General

GENERAL

Ident.: DSC-22-FG-70-60-10-00005838.0002001 / 17 NOV 17
Applicable to: ALL

During descent, OP DES or DES guides the aircraft vertically to an altitude target, or to a glideslope or F-glideslope capture zone.

During automatic emergency descent, EMER DES guides the aircraft vertically to an altitude target.

L2 For more information, *Refer to DSC-22-FG-70-60-40 General*.

L1 V/S / FPA can also descent the aircraft: *Refer to DSC-22-FG-70-70 General*.

Intentionally left blank

OP DES

GENERAL

Ident.: DSC-22-FG-70-60-20-00005839.0001001 / 06 AUG 14
Applicable to: ALL

Open Descent (OP DES) is a vertical selected mode.
When OP DES is engaged, the AP/FD adjusts the pitch in order to maintain a speed/Mach target (selected or managed). The A/THR then maintains idle thrust.
All the altitude constraints are disregarded.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-60-20-00005840.0001001 / 03 DEC 15
Applicable to: ALL

OP DES engages, if the AFS CP selected altitude is below the aircraft altitude, and the flight crew pulls the ALT knob.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-60-20-00005841.0001001 / 03 DEC 15
Applicable to: ALL

OP DES disengages, if one of the following conditions is applicable:

- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude.
  ALT CRZ* engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - One of the following lateral modes is engaged: NAV, LOC*, LOC, LOC BC*, LOC BC
  - L3 The FMS flight phase is cruise or descent
  - The vertical flight plan is valid.

  L1 DES engages.
- The flight crew pulls or pushes the V/S / FPA knob
  V/S / FPA engages.
- The aircraft reaches the glideslope capture zone, when:
  - LOC* or LOC is engaged, and
  - F-G/S is armed.

  G/S* engages.

- The aircraft reaches the glideslope capture zone, when:
  - One of the following modes is engaged: LOC*, LOC, F-LOC*, F-LOC, and
  - G/S is armed.

  F-G/S* engages.
- The flight crew engages go-around.
  SRS GA engages.
- The aircraft reaches the APP-DES capture zone, when:
  - NAV is engaged, and
  - APP-DES is armed

  APP-DES engages.

REVERSION

OP DES reverts to V/S / FPA, if the flight crew sets the AFS CP selected altitude above the aircraft altitude.

When a reversion occurs:
- A triple click audio indicator sounds
- The new guidance mode appears with a white box during 10 s
- The FD bars flash for 10 s.

DES

GENERAL

Ident.: DSC-22-FG-70-60-30-00005842.0001001 / 06 AUG 14
Applicable to: ALL

DES is a managed vertical mode.
DES guides the aircraft vertically along the vertical flight plan. All the altitude constraints, associated to waypoints, are taken into account.
When DES is engaged in idle path, the AP/FD adjusts the pitch in order to maintain a speed/Mach target (selected or managed). The A/THR then maintains idle thrust.
When DES is engaged in geometric path, the AP/FD controls the vertical trajectory. The A/THR is then in SPEED/MACH.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-60-30-00005843.0001001 / 03 DEC 15
Applicable to: ALL

DES can arm only when:
- The altitude set on the AFS CP is below the aircraft altitude
- NAV is armed, or engaged
- APP-DES, LAND, FLARE, or ROLL OUT are not engaged.
- L2 The FMS flight phase is cruise, descent, or approach and the vertical flight path is valid

L1 DES arms, when one of the following occurs:
- DES is previously engaged, and ALT CST* engages
- ALT*, ALT CST*, ALT CRZ*, ALT, ALT CST, or ALT CRZ is engaged, the flight crew pushes the ALT knob and the FMS authorizes DES to arm in accordance with the flight plan.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-60-30-00005844.0001001 / 04 MAY 16
Applicable to: ALL

DES disarms, when one of the following occurs:
- NAV, LOC*, LOC, F-LOC, or F-LOC* disengages
- One of the following modes engages: TCAS, OP DES, V/S / FPA, ALT, G/S*, F-G/S*, G/S, F-G/S, LAND, FLARE, or SRS GA.
- L2 ALT CSTR* engages, and the altitude set on the AFS CP is the altitude constraint
- L3 The flight crew sets an altitude on the AFS CP above the aircraft altitude
- The vertical flight plan is lost

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-60-30-00005845.0001001 / 06 AUG 14
Applicable to: ALL

DES engages, when one of the following occurs:

- ALT CSTR is engaged with DES armed, and the aircraft sequences ALT CSTR waypoint
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The AFS CP selected altitude is below the aircraft altitude
  - One of the following lateral modes is engaged: NAV, LOC*, LOC, LOC BC*, LOC BC, F-LOC*, F-LOC
  - One of the following vertical modes is engaged: OP DES, V/S / FPA, ALT, ALT*, ALT CST, ALT CST*, ALT CRZ, ALT CRZ*, APP-DES, TCAS
  - L3 The FMS flight phase is cruise, descent, or approach
  - The vertical flight plan is valid.

  However, DES will not engage, if one of the following modes is engaged: G/S*, G/S, F-G/S*, F-G/S, LAND.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-60-30-00005846.0001001 / 03 DEC 15
Applicable to: ALL

DES disengages, when one of the following occurs:

- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
- The aircraft reaches the capture zone of the altitude constraint
  ALT CST* engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew pulls the ALT knob
  OP DES engages.
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.
- The aircraft reaches the glideslope capture zone when:
  - LOC* or LOC is engaged, and
  - G/S is armed.

  G/S* engages.
- The aircraft reaches the F-glideslope capture zone when:
  - One of the following modes is engaged: LOC*, LOC, F-LOC*, F-LOC, and
  - F-G/S is armed.

  F-G/S* engages.

- The flight crew engages a go-around.
  SRS GA engages.
- The aircraft reaches the APP-DES capture zone, when:
  - NAV is engaged, and
  - APP-DES is armed.

  APP-DES engages.

REVERSIONS

DES reverts to V/S / FPA, when one of the following occurs:
- The flight crew sets the AFS CP selected altitude above the aircraft altitude
- One of the following modes was engaged, and disengages: NAV, LOC*, LOC, LOC BC*
- L3 The vertical flight plan is lost.

L1 A triple click audio indicator sounds. The FD pitch bar flashes for 10 seconds.

Intentionally left blank

EMER DES

GENERAL

Ident.: DSC-22-FG-70-60-40-00023928.0001001 / 26 FEB 19
Applicable to: ALL

The Emergency Descent function uses combined lateral and vertical modes to perform an assisted Automatic Emergency Descent (AUTO EMER DESCENT) down to the highest altitude between FL 100 and current MORA plus an envelope margin.
The EMER DES mode has the same vertical guidance as the OP DES mode coupled with usual HDG and THR IDLE modes, with an automatic setting of the AFS CP altitude, heading and speed targets.

In addition, when EMER DES mode engages:
- The FDs engage, if not already engaged
- The A/THR automatically activates, if not already activated
- The AP engages, if not already engaged, if EMER DES was automatically armed
- The speed brakes automatically fully extend if EMER DES was automatically armed
- The XPDR automatically squawks the emergency 7700 transponder code
- The TCAS display mode is automatically set to BLW.

Two types of AUTO EMER DESCENT function arming exist:
- The manual arming of the AUTO EMER DESCENT function via dedicated controls (i.e. the EMER DESCENT pb and the speed brakes lever).
  It aims at assisting the flight crew to perform an emergency descent. *Refer to DSC-22-FG-70-110-130 AUTO EMER DESCENT with manual arming*.
- The automatic arming of the AUTO EMER DESCENT function.
  It aims at performing an automatic emergency descent with engagement of the AP/FDs following a severe cabin decompression. The purpose is to cover a possible flight crew incapacitation situation. *Refer to DSC-22-FG-70-110-130 AUTO EMER DESCENT with automatic arming*.

During the AUTO EMER DESCENT, the AP/FD TCAS has priority over the EMER DES mode. When clear of conflict, the AUTO EMER DESCENT function automatically arms again, if automatic arming conditions are still applicable (i.e.: The cabin altitude is still predicted to increase above 14 000 ft in the next 15 s). *Refer to DSC-22-FG-70-110-130 TCAS during AUTO EMER DESCENT*.
When the AUTO EMER DESCENT is completed, the AP/FD guidance reverts to ALT mode to maintain the targeted altitude, and keeps HDG mode. Speed brakes retract to the speed brake lever position if automatically extended, and the speed target is automatically set to Green Dot.

MORA with envelope margin

To ensure sufficient margin versus the terrain at the end of the emergency descent procedure, the altitude target sent to the AFS CP is the FMS Grid MORA corrected by an envelope margin.

This envelope margin takes into account potential large deviation of temperature below standard and low atmospheric barometric pressure.
The value of the envelope margin (between 3 000 ft and 6 000 ft) depends on the FMS grid MORA.
This FMS Grid MORA with envelope margin is referred to as the MORA $_{d\ ISA\ /dP}$ in the FCOM.

Note: The FMS MORA which is displayed on the ND and the VD has no added margin.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-60-40-00023929.0001001 / 01 JUN 17
Applicable to: ALL

The AUTO EMER DESCENT function arms:

- Manually, when the flight crew presses the EMER DESCENT pb, and the aircraft flies above the highest altitude between FL 100 and current MORA$_{dISA/dP}$.
  The ARM indication appears steady on the EMER DESCENT pb.
  EMER DESCENT ARMED message appears on the PFD and on the HUD ◁ .
  L2 If neither CAB PRESS EXCESS CAB ALT nor MISC EMER DESCENT ECAM alert is already displayed, the AUTO FLT EMER DESCENT ECAM alert triggers.

  L1 *Note: The EMER DESCENT ARMED message on the PFD indicates that the flight crew has initiated the manual arming of the AUTO EMER DESCENT function. The AUTO EMER DESCENT function activates only if the flight crew extends the speed brakes.*

- Automatically, when the cabin altitude is predicted to increase above 14 000 ft in the next 15 s.
  L3 For airports with an elevation above 12 000 ft, the cabin altitude threshold for automatic arming of the AUTO EMER DESCENT function is equal to the cabin altitude at the airport plus 2 000 ft. However, the threshold will not exceed a cabin altitude of 18 000 ft.
  L1 The ARM indication flashes on the EMER DESCENT pb.
  AUTO EMER DES IN XX S countdown message appears on the PFD and on the HUD ◁ , to indicate that EMER DES automatically engages at the end of the 15 s countdown.
  The FMA displays EMER DES mode.
  L2 When TCAS disengages upon “CLEAR OF CONFLICT” aural alert, the AUTO EMER DESCENT function arms again automatically, if conditions are still applicable.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-60-40-00023930.0001001 / 08 JUL 19
Applicable to: ALL

If the AUTO EMER DESCENT function was manually armed (i.e. EMER DESCENT ARMED message on the PFD and HUD ◁), the function disarms when one of the following conditions occurs:

- EMER DES engages
- The flight crew presses one time the EMER DESCENT pb.

If the AUTO EMER DESCENT function was automatically armed (i.e. EMER DES on FMA and AUTO EMER DES IN XX S message on the PFD and HUD ◁), the function disarms when one of the following conditions occurs:

- EMER DES engages
- The flight crew presses two times the EMER DESCENT pb

L2 The first action on the EMER DESCENT pb arms the function. Second action disarms the function.

L1 - TCAS engages.

L2 The AUTO EMER DESCENT function automatically disarms when the aircraft altitude is below the highest altitude between FL 100 and current $\text{MORA}_{\text{dISA/dP}}$.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-60-40-00023931.0001001 / 08 JUL 19
Applicable to: ALL

EMER DES engages when one of the following conditions is applicable:

- If the AUTO EMER DESCENT function was manually armed (i.e. EMER DESCENT ARMED message on the PFD and HUD ◁), the flight crew sets the speed brake lever to at least 1/3 position.
- If the AUTO EMER DESCENT function was automatically armed (i.e. EMER DES on FMA and AUTO EMER DES IN XX S message on the PFD and HUD ◁):
  - During the 15 s countdown, the flight crew presses the EMER DESCENT pb, and sets the speed brake lever to at least 1/3 position, or
  - At the end of the 15 s countdown.

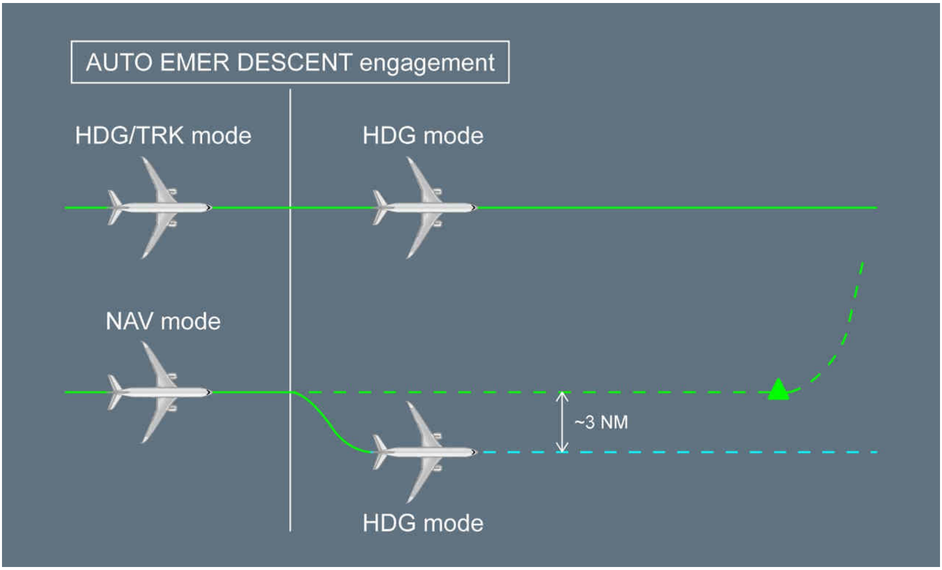
When EMER DES engages, all of the following automatically occurs:

- FDs engage, if not already engaged
- A/THR activates, if not already active, and maintains idle thrust
- The AFS CP managed speed target is set to VMAX – 5 kts

- Lateral guidance reverts to HDG, if not already engaged:
  - The triple click audio indicator sounds
  - If previously in NAV, a right offset of approximately 3 NM is automatically performed along current FMS F-PLN leg.

L2 The HDG/TRK window indicates the HDG target, which changes according to the lateral guidance to reach the offset of approximately 3 NM.

L1
  - If previously in TRK.



- AFS CP selected altitude is set to the highest altitude between FL 100 and current MORA$_{dISA/dP}$
- All altitude constraints are disregarded
- The ARM indication on the EMER DESCENT pb disappears
- XPDR squawks the emergency 7700 transponder code
- TCAS display mode is set to BLW.

In addition, when EMER DES engages after an automatic arming, the following automatically occurs:

- AP engages, if not already engaged
- Speed brakes fully extend
- AUTO EMER DES ENGAGED message appears on PFD, and on HUD ◁ .

L2 The AUTO EMER DES ENGAGED message informs the flight crew under recovery of a previous incapacitation that an AUTO EMER DESCENT is in progress.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-60-40-00023932.0001001 / 08 JUL 19
Applicable to: ALL

EMER DES disengages when one of the following conditions is applicable:
- TCAS engages
- The flight crew engages another vertical mode.

  When EMER DES disengages after an automatic arming, the following occurs:
  - The speed brakes automatically return to the current SPEED BRAKE lever position
  - AUTO EMER DES ENGAGED message on the PFD and on the HUD ◁ disappears.
- At the end of the AUTO EMER DESCENT.

  When EMER DES disengages, the following occurs:
  - ALT* engages
  - The speed brakes automatically return to the current SPEED BRAKE lever position
  - Aircraft decelerates to Green Dot speed computed with speed brakes extended.

    L2 Green Dot speed with speed brakes extended is 13 kt above Green Dot speed for clean configuration.
  - L1 The AUTO EMER DES COMPLETED message replaces the AUTO EMER DES ENGAGED message if displayed on the PFD and on the HUD ◁ .

    L2 The AUTO EMER DES COMPLETED message remains displayed until the flight crew either:
    - ■ Changes any AFS CP target, or
    - ■ Selects another AFS mode, or
    - ■ Voluntarily disconnects the AP.

Intentionally left blank

GENERAL

Ident.: DSC-22-FG-70-70-00005847.0001001 / 03 JUL 20
Applicable to: ALL

1 V/S and FPA are selected vertical modes. They are the basic modes of vertical guidance.
V/S / FPA acquires and holds the vertical speed or the flight path angle, that is displayed in the V/S / FPA window of the AFS CP. For more information, *Refer to DSC-22-FG-90-20 V/S / FPA Window*.
When V/S or FPA mode engages following a reversion, the V/S / FPA target is the current V/S / FPA of the aircraft, or the preselected V/S / FPA.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-70-GENG-00005848.0001001 / 04 MAY 16

V/S / FPA engages, when one of the following occurs:
- The flight crew pushes or pulls the V/S / FPA knob

L3 V/S / FPA will not engage, if LAND is engaged, or SRS GA is engaged below 100 ft RA.

L1
- The APs and FDs are disengaged, and the flight crew engages the FDs or the AP HDG/TRACK also engages.
  If the flight crew engages the FD, the FD pitch and roll bars flash for 10 s.

L2
- V/S / FPA can only engage if the aircraft is airborne for 5 seconds
- 5 s after take off with no vertical modes

L3
- No vertical mode is engaged, and the flight crew engages the FDs

L1
- A reversion to V/S / FPA occurs.

V/S or FPA engages, in accordance with the HDG-V/S / TRK-FPA selection. For more information about the HDG-V/S / TRK-FPA selection: *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection*.

Ident.: DSC-22-FG-70-70-GENG-00005849.0001001 / 03 DEC 15

REVERSIONS TO V/S / FPA

A vertical mode reverts to V/S / FPA, when one of the following occurs:
- OP DES, or DES is engaged, and the AFS CP selected altitude is set above the aircraft altitude
- OP CLB, or CLB is engaged, and the AFS CP selected altitude is set below the aircraft altitude
- DES is engaged and one of the following mode disengages: NAV, LOC, LOC*, F-LOC, F-LOC*
- APP-DES is engaged and NAV disengages.

L3
- The vertical flight plan is lost, when one of the following modes is engaged: DES, APP-DES

L1
- G/S* or G/S is engaged, and LOC* or LOC disengages
- F-GS* or F-G/S is engaged, and F-LOC* or F-LOC disengages

- The flight crew presses the LOC pb, or the APPR pb, when F-G/S*, F-G/S, G/S* or G/S is engaged.
- ALT* is engaged, and the flight crew modifies the AFS CP selected altitude
- L3 The flight crew changes the approach, when one of the following vertical approach mode is engaged:
  - APP-DES is engaged
  - G/S* or G/S is engaged, and the aircraft is below 700 ft RA
  - F-G/S* or F-G/S is engaged.

L1 The TCAS mode can also disengage to revert the V/S mode. For more information about TCAS reversion, *Refer to DSC-22-FG-70-100-40 Consequence on AP/FD Vertical Mode*.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-70-00005850.0001001 / 03 DEC 15
Applicable to: ALL

V/S / FPA disengages, when one of the following occurs:

- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude
  ALT CRZ* engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew pushes the ALT knob
  - NAV engages
  - The AFS CP selected altitude is above the aircraft altitude
  - L3 The FMS flight phase is neither descent, nor approach
  - The vertical flight plan is valid.

  L1 CLB engages.
- The flight crew pushes the ALT knob
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC BC*, LOC BC, F-LOC*, F-LOC
  - The AFS CP selected altitude is below the aircraft altitude
  - L3 The FMS flight phase is cruise, or descent
  - The vertical flight plan is valid.

  L1 DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The aircraft reaches the glideslope capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed.

  G/S* engages.

- The aircraft reaches the F-glideslope capture zone when:
  - LOC*, LOC, F-LOC*, F-LOC is engaged
  - F-G/S is armed.

  F-G/S* engages.
- The flight crew engages go-around.

  SRS GA engages.
- The aircraft reaches the APP-DES capture zone, when:
  - NAV is engaged, and
  - APP-DES is armed

  APP-DES engages.

Intentionally left blank

General

APPROACH OVERVIEW

Applicable to: ALL

Ident.: DSC-22-FG-70-80-00-G00-00005851.0001001 / 09 MAR 16

Flight guidance can guide the aircraft on different types of approaches with:
- LOC and G/S type of guidance for :
  - ILS approach
  - GLS ◁ approach
  - RNAV(GNSS) approach with LPV minima (with SLS ◁ option)
- LOC and FPA type of guidance for RNAV(GNSS) with LP minima (with SLS ◁ function)
- F/LOC or LOC and F/GS type of guidance, for :
  - RNAV(GNSS) with LNAV/VNAV or LNAV only minima
  - Navaids approaches (e.g. VOR, VOR/DME...)
  - ILS approach with glideslope failed
  - LOC only approach with no ILS glideslope
  - LOC B/C approach

Note: *The FLS guidance is only available if FLS parameters associated to the selected approach are available in the FMS database.*

- NAV and APP-DES type of guidance, for RNAV (RNP) approach.

Ident.: DSC-22-FG-70-80-00-G00-00012939.0001001 / 09 MAR 16

APPROACH SELECTION

STANDARD SELECTION

The flight crew selects the approach via the FMS ARRIVAL page.
L2 For more information about approach selection, *Refer to DSC-22-FMS-20-20-20 APPR Button*.

L1 MANUAL TUNING ON THE FMS

If the flight crew manually-tunes a Landing System (LS) approach on the FMS POSITION / NAVAIDS page, the flight guidance system will guide the aircraft on the manually-tuned approach.

If the approach selected on the FMS ARRIVAL page and the LS approach set on the FMS POSITION / NAVAIDS page are different:

- The approach selected on the FMS ARRIVAL page is disregarded, and the CHECK APPR SEL message is displayed on the FMA, and on the FMS message area
  - For more information on FMS message area, *Refer to DSC-22-FMS-20-20-20 LS IDENT Entry Field*
  - For more information on FMA messages, *Refer to DSC-22-FMS-20-40 FMS Messages*.
- The aircraft will fly the manually-tuned LS approach on the FMS POSITION / NAVAIDS page.

Note: *The manual selection is not available for RNAV(GNSS) with LPV minima (with SLS option).*

For more information about manual selection of approach on FMS, *Refer to DSC-22-FMS-20-20-20 LS IDENT Entry Field*.

MANUAL TUNING ON THE RMP (BACKUP)

If all the FMCs are fault, the flight crew selects the RAD NAV pb to STBY on the RMP 1 or 2, in order to manually-tune the frequency and the course of a NAVAIDS approach, a GLS approach, or an ILS approach.

SELECTION IN THE MMRS RECEIVERS

When an approach is selected on the FMS ARRIVAL page, or manually-tuned on FMS POSITION / NAVAIDS page, or via the RMP, the approach frequency and course are sent to both MMRs receivers.
In case of discrepancy between both MMRs the NAV LS TUNING DISAGREE (*Refer to procedure*) triggers.

Note: *Below 700 ft RA, when an approach mode is engaged, the flight guidance system freezes the LS selection in the MMR. As a result, the MMR does not take into account any change of the LS selection.*

ILS/GLS (IF INSTALLED)/SLS (IF INSTALLED) GUIDANCE MODE

Applicable to: ALL

Ident.: DSC-22-FG-70-80-00-G10-00005852.0001001 / 09 MAR 16

ILS GUIDANCE MODE

An ILS guidance mode uses the Localizer and Glideslope signals from localizer antennas and a glideslope antenna on ground.
The MMR computes the ILS lateral and vertical angular deviations.

L1 The ILS lateral deviation is referred to as the LOC deviation, and the ILS vertical deviation is referred to as the G/S deviation.
The Flight Guidance uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S beams.

APPROACH MODES

The ILS guidance modes are:

	Lateral Guidance	**Vertical Guidance**
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	G/S*: Capture of the G/S beam G/S: Track of the G/S beam.
Below 400 ft RA, and until end of roll out	LAND: Track of LOC and G/S beams for autoland. FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down.	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities is required.
L2 For more information about approach capability, *Refer to DSC-22-FG-80 General*.

Ident.: DSC-22-FG-70-80-00-G10-00005855.0003001 / 09 MAR 16

GLS ◁ GUIDANCE MODE

The Ground Based Augmentation System (GBAS) Landing System (GLS ◁) guidance mode uses the Global Navigation Satellite System (GNSS) position with a correction and integrity signal from a ground station also known as Ground Based Augmentation System (GBAS).
L2 The MMR computes the GLS ◁ deviations.
L1 The GLS ◁ lateral deviation is referred to as the LOC deviation, and the GLS ◁ vertical deviation is referred to as the G/S deviation.

Note: *The computed lateral and vertical deviations are available up to 20 NM from the runway threshold.*

The Flight Guidance uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S approach path, like ILS.

APPROACH MODES

The GLS ◁ guidance modes are:

Height	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	G/S*: Capture of the G/S beam G/S: Track of the G/S beam.
Below 400 ft RA, and until end of roll out	LAND: Track of LOC and G/S beams for autoland. FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down.	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities is required.

L2 For more information about approach capability, *Refer to DSC-22-FG-80 General*.

Ident.: DSC-22-FG-70-80-00-G10-00012751.0002001 / 09 MAR 16

SLS ◁ GUIDANCE MODE

The Satellite Landing System (SLS ◁) guidance mode uses the Global Navigation Satellite System (GNSS) position with correction and integrity monitoring signal from satellite constellations, also known as Satellite Based Augmentation System (SBAS).
The SLS ◁ guidance mode enables the flight crew to fly an RNAV(GNSS) straight-in approach with LPV minima, or LP minima with the LOC guidance mode only.

L2 The MMR computes the SLS ◁ deviations.

L1 The SLS ◁ lateral deviation is referred to as the LOC deviation. The SLS ◁ vertical deviation is referred to as the G/S deviation.
The Flight Guidance uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S approach path, like ILS.

APPROACH MODES

The SLS ◁ guidance modes are:

Height	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	G/S*: Capture of the G/S beam G/S: Track of the G/S beam.
Below 400 ft RA	FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities is required.

L2 For more information about approach capability, *Refer to DSC-22-FG-80 General*.

Ident.: DSC-22-FG-70-80-00-G10-00012946.0001001 / 03 JUL 20

1 APPROACH SEQUENCE

The sequence to fly an approach is the following:

1. The flight crew selects the approach on the FMS ARRIVAL page.
2. The flight crew presses the LS pb to display the deviation scale on the PFD and the approach and landing capability on the FMA.

   Note: *The final capability appears when the AP(s) are engaged and the APPR pb is pressed.*

3. The FMS approach phase activates:
   - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
   - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint.

   For more information on the activation of the FMS approach phase, *Refer to DSC-22-FMS-10-50-30 Overview*.

   Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration. For more information, *Refer to DSC-22-FG-60-20 Managed Speed/Mach Target*.
4. The flight crew presses the APPR pb on the AFS CP:
   - LOC and G/S arm
   - The flight crew can engage the second AP, if applicable.

   Note: *The final approach and landing capability is then available. Nevertheless, the approach capability can change during the approach.*

5. The aircraft reaches the capture zone of the LOC beam: LOC* engage.
6. The aircraft becomes established on the LOC beam: LOC engage.
7. The aircraft reaches the capture zone of the G/S beam: G/S* engages.

   L2 Note: *G/S* can also engage before LOC engagement, when LOC* is engaged.*

8. L1 The aircraft becomes established on the G/S beam: G/S engages.

   L2 Note: *G/S can only engage, when LOC is engaged.*

9. L1 At 400 ft RA, LAND engages.

   Note: *LAND is not displayed on the FMA if the approach and landing capability is APPR1*

10. At 150 ft the DISCONNECT AP FOR LANDING message appears if the landing capability is APPR1
11. Depending on the approach category, the flight crew can disengage all AP at Decision Height (DH) to land manually.
12. At approximately 60 ft RA, FLARE engages.

13. At touchdown, ROLL OUT engages.
14. At the end of the roll out, if an autoland is performed, the flight crew disengages the AP.

Note: *At the step 3, the flight crew can press the LOC pb instead of the APPR pb to intercept the LOC guidance first: LOC arms, LOC* engages, and LOC engages.*
When ready to intercept the G/S guidance, the flight crew presses the APPR pb: G/S arms, G/S engages, and G/S engages.*

APPROACH WITH FLS GUIDANCE

Applicable to: ALL

Ident.: DSC-22-FG-70-80-00-G20-00005858.0001001 / 02 OCT 14

FLS FUNCTION AVAILABILITY

The FLS function is available, if the flight crew selects:
- A VOR, RNV, GNSS, LOC or BAC approach on the FMS ARRIVAL page

L3 The FLS function is not available for SDF, IGS without glide, and LDA approaches.

L1
- An ILS approach on the FMS ARRIVAL page, and deselects the G/S via the DESELECT GLIDE button on the FMS POSITION / NAVAIDS page.

However, the FLS function is not available, if:
- The Missed Approach Point (MAP) is before the runway threshold, and
- The difference between the final approach course and the runway course is more than 50°.

If the FLS function is not available for an approach, the NO FLS FOR THIS APPR message appears on the FMS message area.

Ident.: DSC-22-FG-70-80-00-G20-00005856.0001001 / 09 MAR 16

APPROACHES FLOWN WITH LATERAL AND VERTICAL FLS GUIDANCE

The flight crew can use the FLS function to fly the following approaches with a lateral and vertical FLS guidance :
- NAVAIDS approaches (e.g. VOR, VOR/DME...)
- RNAV approach,
- RNAV(GNSS) approach with LNAV/VNAV or LNAV minima only.

L2 The MMR computes the FLS deviations.

L1 The FLS function provides the flight crew with flight guidances like ILS, with:
- A pseudo LOC deviation, referred to as F-LOC deviation
- A pseudo G/S deviation, referred to as F-G/S deviation.

L2 For more information on the definition of the FLS beam, FLS Beam Computation. *Refer to DSC-22-FMS-10-30-40 FLS Beam Computation*

L1 **APPROACH MODES**

The approach modes are:

Lateral Guidance	Vertical Guidance
F-LOC*: Capture of F-LOC beam	F-G/S*: Capture of F-G/S beam
F-LOC: Track of F-LOC beam.	F-G/S: Track of F-G/S beam.

L2 These approach modes use the same guidance laws as LOC*, LOC, G/S*, and G/S modes.

Ident.: DSC-22-FG-70-80-00-G20-00005857.0001001 / 02 OCT 14

APPROACHES FLOWN WITH VERTICAL FLS GUIDANCE

The flight crew can use the FLS function to fly the following approaches with a vertical FLS guidance:
- ILS approach with glideslope out,
- LOC only approach,
- LOC B/C approach

L2 The MMR computes the FLS deviations.

L1 The FLS function provides the flight crew with flight guidances like ILS, with:
- A LOC ILS deviation
- A pseudo G/S deviation, referred to as F-G/S deviation.

APPROACH MODES

The approach modes are:

Type of Approach	Lateral Guidance	Vertical Guidance
ILS with glideslope out	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	F-G/S*: Capture of the F-G/S beam F-G/S: Track of the F-G/S beam.
LOC only		
LOC B/C	LOC B/C*: Capture of the LOC beam LOC B/C: Track of the LOC beam.	

Ident.: DSC-22-FG-70-80-00-G20-00005859.0001001 / 03 DEC 15

APPROACH SEQUENCE FOR NPA FLOWN WITH FLS FUNCTION

The sequence to fly an approach with the FLS function, is the following:
1. The flight crew selects the approach on the FMS ARRIVAL page.
2. The flight crew presses the LS pb on the EFIS CP: The LS deviations appear on the PFD, and the FLS approach and landing capability appears on the FMA.

3. The FMS approach phase activates:
   - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
   - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint.

   Note: *The approach phase also activates when the aircraft flies the DECEL pseudo waypoint, if the flight crew pressed the LOC pb and F-LOC*, LOC*, LOC B/C*, F-LOC, LOC, or LOC B/C is engaged.*

   For more information on the activation of the FMS approach phase, *Refer to DSC-22-FMS-10-50-30 Overview*.
   Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration. For more information, *Refer to DSC-22-FG-60-20 Managed Speed/Mach Target*.
4. The flight crew presses the APPR pb on the AFS CP: F-LOC, LOC, or LOC B/C arms, and F-G/S arms.
5. The aircraft reaches the capture zone of F-LOC, LOC or LOC B/C beam: F-LOC*, LOC*, or LOC B/C* engages.
6. The aircraft becomes established on the F-LOC, LOC or LOC B/C beam: F-LOC, LOC, or LOC B/C engages.
7. The aircraft reaches the capture zone of F-G/S beam: F-G/S* engages.

   Note: *F-G/S* can also engage, when F-LOC*, LOC*, or LOC B/C* is engaged.*
8. The aircraft becomes established on the F-G/S beam: F-G/S engages.
9. At the Minimum Descent Altitude (MDA), the flight crew disengages the AP and the FDs
10. At 150 ft, if one AP is still engaged, the DISCONNECT AP FOR LDG message appears on the FMA.
11. The flight crew manually lands the aircraft.

Note: *At the step 4, the flight crew can press the LOC pb instead of the APPR pb in order to intercept the F-LOC, LOC or LOC B/C beam first: F-LOC, LOC, or LOC B/C arms, F-LOC*, LOC*, or LOC B/C* engages, and F-LOC, LOC, or LOC B/C engages.*
When ready to intercept the F-G/S beam, the flight crew presses the APPR pb: F-G/S arms, F-G/S engages, and F-G/S engages.*

APPROACH WITHOUT FLS GUIDANCE

Applicable to: ALL

Ident.: DSC-22-FG-70-80-00-G30-00005860.0001001 / 02 OCT 14

NAVAIDS, OR RNAV APPROACH FLOWN WITHOUT FLS FUNCTION

APPROACH MODES

The flight crew can also fly an approach based on NAVAIDS or RNAV(GNSS):
- In NAV, with selected vertical modes
- In selected vertical and lateral modes.

APPROACH SEQUENCE

The approach sequence is the following:
1. The flight crew selects the approach on the FMS ARRIVAL page (VOR, RNV, GNSS...).
2. The FMS approach phase activates:
    - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
    - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint.
    Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration.

Note: In this case, the flight crew does not press the LOC pb or APPR pb.

Ident.: DSC-22-FG-70-80-00-G30-00005861.0001001 / 02 OCT 14

ILS WITH GLIDE SLOPE OUT, LOC ONLY, OR LOC B/C APPROACH FLOWN WITHOUT FLS FUNCTION

The aircraft can fly an ILS with the glide slope out, a LOC only, or a LOC B/C approach without the FLS function.

APPROACH MODES

The approach modes are:

Type of Approach	Lateral Guidance	Vertical Guidance
ILS with glide slope out	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	ALT*, ALT FPA (or V/S)
LOC only		
LOC B/C	LOC B/C*: Capture of the LOC beam LOC B/C: Track of the LOC beam.	

APPROACH SEQUENCE

The sequence to fly the approach without the FLS function is:

1. The flight crew selects the approach on the FMS ARRIVAL page.
2. The FMS approach phase activates:
   - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
   - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint.

   Note: *The approach phase also activates when the aircraft flies the DECEL pseudo waypoint, if the flight crew pressed the LOC pb and , LOC*, LOC B/C*, LOC, or LOC B/C is engaged.*

   Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration.
3. The flight crew presses the LOC pb on the AFS CP: LOC, or LOC B/C arms. The flight crew manages the vertical guidance by using selected vertical modes: ALT*, ALT.
4. The aircraft reaches the capture zone of the LOC or LOC B/C beam: LOC*, or LOC B/C* engages.
5. The aircraft becomes established on the LOC or LOC B/C beam: LOC, or LOC B/C engages.
6. The flight crew manually manages the vertical path with the V/S or FPA mode.
7. At the Minimum Descent Altitude (MDA), if one AP is engaged, the flight crew disengages the AP.
8. At 150 ft, if one AP is still engaged, the DISCONNECT AP FOR LDG message appears on the FMA.
9. The flight crew manually lands the aircraft.

LOC* Mode

GENERAL

Ident.: DSC-22-FG-70-80-10-00005862.0001001 / 09 MAR 16
Applicable to: ALL

The Localizer capture (LOC*) mode captures the localizer beam of the ILS(GLS ⊲)(SLS ⊲).

ARMING AND DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-10-00005863.0001001 / 02 OCT 14
Applicable to: ALL

LOC* and LOC modes arm (disarm) together and simultaneously.
As a consequence, LOC* arms with the LOC indication on the FMA.
L2 For LOC arming conditions, *Refer to DSC-22-FG-70-80-20 Arming Conditions*.
For LOC disarming conditions, *Refer to DSC-22-FG-70-80-20 Disarming Conditions*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-10-00005864.0001001 / 29 SEP 16
Applicable to: ALL

LOC* engages, when LOC is armed, and the aircraft reaches the capture zone, or the pre-capture zone of the LOC beam.

PRE-CAPTURE OF THE LOC BEAM

The aircraft uses the aircraft position and the FMS trajectory to provide guidance in order to pre-capture the LOC beam.

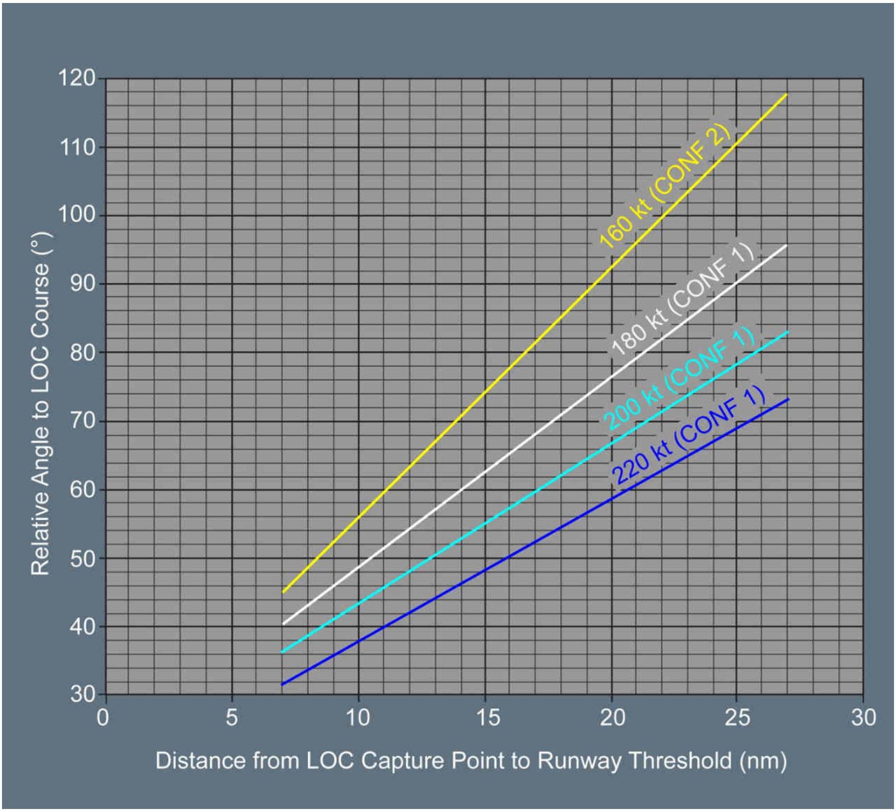
The pre-capture of the LOC beam allows to:
- Enhance the performance of the LOC capture
- Avoid a false capture
- Capture the LOC beam without overshoot.

The pre-capture zone is available, when all of the following conditions are applicable:
- The LOC deviation is more than 2.3 dots
- The FMS is in NAV PRIMARY.
- L2 The difference between the track and the LOC course is less than 115 °
- The roll order is such that LOC* will capture the LOC beam with a single turn.

L1 *Note:* *During the pre-capture, the lateral deviation does not move on the LS scale.*

L2 If the pre-capture of the LOC beam is not available, the following graph illustrates the angle of interception, depending on the distance to the runway threshold that ensures an interception with a single overshoot. In this case, the overshoot does not exceeds 1.3 dot.

LOC Beam Capture



L1 CAPTURE ZONE OF THE LOC BEAM

The aircraft reaches the capture zone of the LOC beam, when one of the following occurs:

- The LOC deviation is less than 2.3 dots, and:
  - L2 The difference between the track and the LOC course is less than 115 °, and
  - The roll order is such that LOC* will capture the LOC beam with a single turn.
- L1 The LOC deviation is less than 1.3 dot, and the difference between the track and the LOC course is less than 15 °.

L2 If the approach is an ILS, the LOC* mode uses the ILS LOC deviation to perform the capture.

L1 *Note:* *During the LOC capture, the LOC deviation starts to move toward the center of the LS scale, on the PFD and ND, when the LOC deviation is less than 2 dots.*

L2 LOC CONVERGENCE FUNCTION

The purpose of the LOC convergence function is to help to intercept and capture the LOC axis.

The flight guidance intercepts the LOC axis with a 20 ° track convergence, when all the following conditions are applicable:
- The LOC mode is armed
- The NAV mode is engaged
- The aircraft is within 20 NM of the destination runway
- The difference between the aircraft track and the runway course is less than 20 °.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-10-GDISE-00005865.0001001 / 03 DEC 15

LOC* disengages, when another lateral mode engages.

L2 LOC* disengages, when one of the following occurs:
- The aircraft becomes established on the LOC beam

L3 LOC* is engaged with a LOC deviation less than 0.2 dot, during 10 s.

L2 LOC engages.
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged
  HDG/TRACK engages.
- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.

L3
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.

L2
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-10-GDISE-00005866.0001001 / 03 DEC 15

L2 REVERSIONS

LOC* reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - G/S is armed
  - G/S* is engaged
  - G/S is engaged
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- The flight crew inserts a DIRECT TO CRS IN or DIRECT TO CRS OUT in the active flight plan.
- L3 The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
- L2 The FG detects a difference between both MMRs.

When LOC* reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA.

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

LOC Mode

GENERAL

Ident.: DSC-22-FG-70-80-20-00005867.0001001 / 09 MAR 16
Applicable to: ALL

The Localizer track (LOC) mode tracks the localizer beam of the ILS(GLS ◁)(SLS ◁).

ARMING CONDITIONS

Ident.: DSC-22-FG-70-80-20-00005868.0001001 / 04 MAY 16
Applicable to: ALL

L2 LOC can only arm when all of the following are applicable:
- HDG/TRACK or NAV is engaged
- The vertical mode is not SRS either for take off, or go-around
- L3 The aircraft is above 400 ft RA.

L1 LOC arms, when the flight crew presses the APPR pb, or the LOC pb, and one of the following conditions is applicable:
- An ILS, GLS ◁ , or RNAV(GNSS) with LPV(LP) minima (with SLS ◁ option) approach is set on the FMS ARRIVAL page
- An ILS, GLS ◁ is manually-tuned on the FMS POSITION NAVAIDS page (*Refer to DSC-22-FMS-20-20-20 LS IDENT Entry Field*)

  Note: *If the flight crew sets a different ILS approach on the FMS ARRIVAL page:*
  - *The aircraft will fly the manually-tuned LS*
  - *The MFD displays the RUNWAY / LS DISAGREE message.*

- L3 At least one LS receiver must be operative. If both receivers are operative, the LS parameters must be the same in both LS receivers.
- L1 A LOC only approach is set on the FMS ARRIVAL page.

L2 *Note:* *The flight crew can also deselect the G/S of an ILS approach on the FMS POSITION NAVAIDS page (Refer to DSC-22-FMS-20-20-20 DESELECT GLIDE Button)*

- L1 The flight crew manually-tuned the frequency and course of an ILS/GLS ◁ on the RMP (*Refer to DSC-34-NAV-70-30 How to Tune the Navaids in STBY RAD NAV*)

L2 For information on approach selection on the FMS ARRIVAL page, *Refer to DSC-22-FMS-20-20-20 APPR Button*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-20-00005869.0001001 / 03 DEC 15
Applicable to: ALL

LOC disarms, when LOC* engages.

L2 LOC also disarms, when one of the following occurs:
- G/S or F-G/S is armed, and the flight crew presses the APPR pb
- Neither G/S, nor F-G/S is armed, and the flight crew presses the LOC pb
- L3 NAV arms
- The flight crew engages go-around
- The flight crew modifies the approach selection

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*
- The LS parameters are different in both LS receivers.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-20-00005870.0001001 / 03 DEC 15
Applicable to: ALL

LOC engages, when LOC* is engaged, and the aircraft becomes established on the LOC beam.
L3 The aircraft becomes established on the LOC beam, when LOC* is engaged with a LOC deviation less than 0.2 dot, during 10 s.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-20-GDISE-00005871.0001001 / 03 DEC 15

LOC disengages, when another lateral mode engages.

L2 LOC disengages, when one of the following occurs:
- G/S is engaged, and LAND engages
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged
  HDG/TRACK engages.
- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- L3 The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.
- L2 The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-20-GDISE-00005872.0001001 / 03 DEC 15

L2 REVERSIONS

LOC reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - G/S is armed
  - G/S* is engaged
  - G/S is engaged
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- L3 The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
- L2 The flight crew inserts a DIRECT TO CRS IN or DIRECT TO CRS OUT in the active flight plan.
- The FG detects a difference between both MMRs.

When LOC reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA .

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

Intentionally left blank

G/S* Mode

GENERAL

Ident.: DSC-22-FG-70-80-30-00005873.0001001 / 09 MAR 16
Applicable to: ALL

The Glide Slope capture (G/S*) mode captures the glide slope beam of the ILS(GLS ◁)(SLS ◁).

ARMING AND DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-30-00005874.0001001 / 02 OCT 14
Applicable to: ALL

G/S* and G/S modes arm (disarm) together and simultaneously.
As a consequence, G/S* arms with the G/S indication on the FMA.
L2 For G/S*, or G/S arming conditions, *Refer to DSC-22-FG-70-80-40 Arming Conditions*.
For G/S*, or G/S disarming conditions, *Refer to DSC-22-FG-70-80-40 Disarming Conditions*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-30-00005875.0001001 / 03 DEC 15
Applicable to: ALL

G/S* engages when the aircraft reaches the capture zone of the G/S beam, and all of the following conditions are applicable:

- G/S is armed
- LOC* or LOC is engaged.

L2 The aircraft reaches the capture zone of the G/S beam, when one of the following occurs:

- Passage far from the G/S beam:
  - The G/S deviation is less than 2 dots
  - The pitch order is such that G/S* will capture the G/S beam with a single resource.
- Passage near the G/S beam: The G/S deviation is less than a threshold depending on the radio altitude.
  This threshold is between 0.1 and 1/3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-30-GDISE-00005876.0001001 / 03 DEC 15

G/S* disengages when another vertical mode engages.

L2 G/S* disengages, when one of the following occurs:

- The aircraft becomes established on the G/S beam
L3 G/S is engaged for more than 15 s, and the G/S deviation becomes less than 0.3 dot.
L2 G/S engages.
- The flight crew pushes or pulls the V/S / FPA knob
V/S / FPA engages.
- The flight crew pulls the ALT knob
OP CLB or OP DES engages.
- The flight crew presses the ALT pb
ALT engages.
- The flight crew performs a go-around
SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-30-GDISE-00005877.0001001 / 03 DEC 15

L2 REVERSIONS

G/S* reverts to V/S / FPA, when one of the following occurs:

- LOC disengages
The lateral mode also reverts to HDG/TRACK.
- The flight crew presses the APPR pb
The lateral mode also reverts to HDG/TRACK.
- The flight crew pulls the HDG/TRK knob
The lateral mode also reverts to HDG/TRACK.
- The flight crew presses the LOC pb
- L3 The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
The lateral mode also reverts to HDG/TRACK.
- L2 The FG detects a difference between both MMRs

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

G/S Mode

GENERAL

Ident.: DSC-22-FG-70-80-40-00005878.0001001 / 09 MAR 16
Applicable to: ALL

The Glide Slope track (G/S) mode tracks the glide slope beam of the ILS(GLS)(SLS).

ARMING CONDITIONS

Ident.: DSC-22-FG-70-80-40-00005879.0001001 / 08 JUL 19
Applicable to: ALL

L3 G/S arms when at least one LS receiver is operative. If both receivers are operative, the LS parameters must be the same in both LS receivers.

L1 G/S arms, when the flight crew presses the APPR pb, and one of the following conditions is applicable:
- The flight crew has selected an ILS, GLS , or RNAV(GNSS) with LPV minima (with SLS option) approach on the FMS ARRIVAL page
- The flight crew has manually-tuned an ILS, or GLS approach on the FMS POSITION NAVAIDS page (*Refer to DSC-22-FMS-20-20-20 LS IDENT Entry Field*)

  Note: *If the flight crew has selected a different LS approach on the FMS ARRIVAL page:*
  - *The aircraft will fly the manually-tuned LS*
  - *The MFD displays RUNWAY / LS DISAGREE message.*
- The flight crew has manually-tuned the frequency and course of an ILS/ GLS on the RMP (*Refer to DSC-23-20 NAV Page*).

G/S cannot arm if one the following condition is applicable:
- One of the following mode is engaged: SRS TO, RWY, RWY TRK, SRS GA, GA TRK
- The aircraft is below 400 ft RA.

For information on approach selection on the FMS ARRIVAL page, *Refer to DSC-22-FMS-20-20-20 APPR Button*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-40-00005880.0001001 / 02 OCT 14
Applicable to: ALL

G/S disarms, when G/S engages.

L2 G/S also disarms, when one of the following occurs:
- The flight crew presses the APPR pb, or the LOC pb
- LOC disarms
- LOC*, or LOC is lost.
- The flight crew performs a go around
  SRS and GA TRK engage.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-40-00005881.0001001 / 03 DEC 15
Applicable to: ALL

G/S engages, when G/S* is engaged, and the aircraft becomes established on the G/S beam.

L3 The aircraft becomes established on the G/S beam, when:
- G/S* is engaged for more than 15 s, and
- The G/S deviation becomes less than 1/3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-40-GDISE-00005882.0001001 / 03 DEC 15

G/S disengages when another vertical mode engages.

L2 G/S disengages, when one of the following occurs:
- LAND engages at 400 ft, if the approach and landing capability is LAND1(2)(3).
- The flight crew pushes, or pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-40-GDISE-00005883.0001001 / 03 DEC 15

L2 REVERSIONS

G/S reverts to V/S / FPA, when one of the following occurs:
- LOC disengages
  The lateral mode also reverts to HDG/TRACK.
- The flight crew presses the APPR pb
  The lateral mode also reverts to HDG/TRACK.

- The flight crew presses the LOC pb
- The flight crew pulls the HDG/TRK knob
  The lateral mode also reverts to HDG/TRACK.

L3
- The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the FMS POS/NAVAIDS page.
  The lateral mode also reverts to HDG/TRACK.

L2
- The FG detects a difference between both MMRs.

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

Intentionally left blank

LAND Mode

GENERAL

Ident.: DSC-22-FG-70-80-50-00005884.0001001 / 02 OCT 14
Applicable to: ALL

The LAND mode is a common vertical and lateral mode.
The LAND mode tracks the LOC and G/S beams from 400 ft RA to approximately 60 ft RA.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-50-00005885.0001001 / 02 OCT 14
Applicable to: ALL

LAND automatically engages, when all the following conditions occur:
- The approach and landing capability is LAND1(2)(3)
- G/S and LOC are engaged
- The landing gear, the slats or the flaps are extended.
- The aircraft reaches 400 ft RA

L3 The aircraft is below400 ft for more than 1 s.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-50-00005886.0001001 / 02 OCT 14
Applicable to: ALL

LAND automatically disengages, when the aircraft approximately reaches 60 ft RA: FLARE engages.
When LAND is engaged, no action on the AFS CP can disengage LAND.
The flight crew can only disengage LAND by performing a go-around. SRS GA and GA TRK will engage.

Intentionally left blank

FLARE Mode

GENERAL

Ident.: DSC-22-FG-70-80-60-00005887.0001001 / 02 OCT 14
Applicable to: ALL

The FLARE mode is a common lateral and vertical mode:
- Lateral guidance: The FLARE mode reduces the slideslip angle, such that the aircraft will be aligned with the runway centerline at the aircraft touchdown
- Vertical guidance: The FLARE mode decreases the descent rate, in order to ensure a comfortable transition between the glide tracking, and the aircraft touchdown.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-60-00005888.0001001 / 03 DEC 15
Applicable to: ALL

FLARE engages, if all the following conditions are applicable:
- The aircraft approximately reaches 60 ft
- The approach that the flight crew selects is either an ILS approach, a GLS approach, or a RNAV(GNSS) approach with LPV minima.

L3 FLARE engages only if the following conditions are applicable:
- The slats/flaps are extended, or the landing gears are extended
- One valid RA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-60-00005889.0001001 / 02 OCT 14
Applicable to: ALL

FLARE automatically disengages, when the aircraft touches down, and ROLL OUT engages.
The flight crew can only disengage FLARE by performing a go-around.

Intentionally left blank

ROLL OUT Mode

GENERAL

Ident.: DSC-22-FG-70-80-70-00005890.0001001 / 02 OCT 14
Applicable to: ALL

ROLL OUT is a common lateral and vertical mode:
- Lateral guidance: The ROLL OUT mode guides the aircraft along the runway centerline
- Vertical guidance: The ROLL OUT mode lands the nose landing gear.

L3 The vertical speed is close to 2.5 ft/s.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-70-00005891.0001001 / 03 DEC 15
Applicable to: ALL

The FLARE mode changes to the ROLL OUT mode when the aircraft touches down.

L3 The ROLL OUT engages, if:
- FLARE is engaged
- The aircraft is on ground.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-70-00005892.0001001 / 03 DEC 15
Applicable to: ALL

ROLL OUT disengages, when one of the following occurs:
- When the aircraft exists the runway.

L2 *Note:*
- *When the difference between the aircraft track and the runway track is more than 20°, the ROLL OUT disengages due to the AP(s) and FDs disengagement*
- *In automatic roll-out, the flight crew should disengage the AP(s) at low speed, as per procedure.*

L1 - The flight crew engages a go-around

L3 - The APs are disengaged, and the flight crew presses the APPR pb.
This is applicable, if ROLL OUT is engaged for more than 10 s.

Intentionally left blank

F-LOC* Mode

GENERAL

Ident.: DSC-22-FG-70-80-80-00005893.0001001 / 02 OCT 14
Applicable to: ALL

The FLS Localizer capture (F-LOC*) mode captures the F-LOC beam.

ARMING AND DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-80-00005894.0001001 / 03 DEC 15
Applicable to: ALL

F-LOC* and F-LOC modes arm (disarm) together and simultaneously.
As a consequence, F-LOC* arms with the F-LOC indication on the FMA.
L2 For F-LOC arming conditions, *Refer to DSC-22-FG-70-80-90 Arming Conditions*.
For F-LOC disarming conditions, *Refer to DSC-22-FG-70-80-90 Disarming Conditions*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-80-00005895.0001001 / 03 DEC 15
Applicable to: ALL

F-LOC* engages, when F-LOC is armed, and the aircraft reaches the capture zone, or the pre-capture zone of the F-LOC beam.
The capture zone is a zone available, when the F-LOC deviation is less than 2.3 dots.
The pre-capture zone is a zone available, when the F-LOC deviation is more than 2.3 dots.

L2 CAPTURE ZONE OF THE F-LOC BEAM

The aircraft reaches the capture zone of the F-LOC beam, when one of the following occurs:

- The F-LOC deviation is less than 2.3 dots, and:
  - The difference between the track and the F-LOC course is less than 115 °, and
  - The roll order is such that F-LOC* will capture the F-LOC beam with a single turn.
- The F-LOC deviation is less than 1.3 dot, and the difference between the track and the F-LOC course is less than 15 °.

PRE-CAPTURE OF THE F-LOC BEAM

The aircraft reaches the pre-capture zone of the F-LOC beam, when all of the following conditions are applicable:

- The F-LOC deviation is more than 2.3 dots
- The difference between the track and the F-LOC course is less than 115 °
- The roll order is such that F-LOC* will capture the F-LOC beam with a single turn.
- The FMS is in NAV PRIMARY.

F-LOC* disengages, when another lateral mode engages.

L2 F-LOC* disengages, when one of the following occurs:

- The aircraft becomes established on the F-LOC beam

L3 F-LOC* is engaged with a F-LOC deviation less than 0.2 dot, during 10 s.

L2 F-LOC engages.

- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged
  HDG/TRACK engages.
- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.

L3 - The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.

L2 - The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-80-GDISE-00005897.0001001 / 03 DEC 15

L2 REVERSIONS

F-LOC* reverts to HDG/TRACK, when one of the following occurs:
- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- L3 The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
- L2 The flight crew inserts a DIRECT TO CRS IN or DIRECT TO CRS OUT in the active flight plan.
- The FG detects a difference between both MMRs.

When F-LOC* reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA.

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

Intentionally left blank

F-LOC Mode

GENERAL

Ident.: DSC-22-FG-70-80-90-00005898.0001001 / 02 OCT 14
Applicable to: ALL

The FLS Localizer track (F-LOC) mode tracks the F-LOC beam.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-80-90-00005899.0001001 / 03 DEC 15
Applicable to: ALL

L3 F-LOC can arm if all of the following conditions are applicable:
- At least one FMS is operative
- At least one MMR is able to compute the F-LOC and F-G/S deviations

  Note: If the NO FLS FOR THIS APPR message appears on the MFD, the MMR(s) will not be able to compute the F-LOC and F-G/S deviations.

- When both MMRs are operative, the runway headings of the approach that the flight crew selects must be the same in both MMRs.
- The aircraft is above 400 ft RA.
- The vertical mode is not SRS either for takeoff, or go-around.

L1 F-LOC arms, when all of the following conditions are applicable:
- The flight crew selected an approach in the ARRIVAL page of the FMS that is compatible with the FLS function (e.g. NDB, NDB/DME, VOR, VOR/DME, RNV(GNSS),...).

  Note: If the NO FLS FOR THIS APPR message appears on the MFD, the FLS function is not applicable.

L2 - HDG/TRACK or NAV is engaged

L1 - The flight crew presses the APPR pb, or the LOC pb.

L2 For information on approach selection on the ARRIVAL page of the FMS, *Refer to DSC-22-FMS-20-20-20 APPR Button*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-90-00005900.0001001 / 03 DEC 15
Applicable to: ALL

F-LOC disarms when F-LOC* engages.

L2 F-LOC also disarms, when one of the following occurs:
- F-G/S is armed, and the flight crew presses the APPR pb
- F-G/S is not armed, and the flight crew presses the LOC pb
- L3 NAV arms
- The flight crew engages go-around
- The flight crew modifies the approach selection

  Note: The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.
- The LS parameters are different in both receivers.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-90-00005901.0001001 / 03 DEC 15
Applicable to: ALL

F-LOC can engage, when F-LOC* is engaged and the aircraft becomes established on the F-LOC beam.

L3 The aircraft becomes established on the F-LOC beam, when F-LOC* is engaged with a F-LOC deviation less than 0.2 dot, during 10 s.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-90-GDISE-00005902.0001001 / 03 DEC 15

F-LOC disengages, when another lateral mode engages.

L2 F-LOC disengages, when one of the following occurs:
- The flight crew presses the LOC pb, there is no vertical managed mode of approach armed or engaged
  HDG/TRACK engages.
- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- L3 The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.
- L2 The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-90-GDISE-00005903.0001001 / 03 DEC 15

L2 REVERSIONS

F-LOC reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- L3 The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
- L2 The flight crew inserts a DIRECT TO CRS IN or DIRECT TO CRS OUT in the active flight plan
- The FG detects a difference between both MMRs.

When F-LOC reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA.

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

Intentionally left blank

F-G/S* Mode

GENERAL

Ident.: DSC-22-FG-70-80-100-00005904.0001001 / 02 OCT 14
Applicable to: ALL

The FLS Glide Slope capture (F-G/S*) mode captures the F-G/S beam.

ARMING AND DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-100-00005905.0001001 / 02 OCT 14
Applicable to: ALL

F-G/S* and F-G/S modes arm (disarm) together and simultaneously.
As a consequence, F-G/S* arms with the F-G/S indication on the FMA.
L2 For F-G/S arming conditions, *Refer to DSC-22-FG-70-80-110 Arming Conditions*.
For F-G/S disarming conditions, *Refer to DSC-22-FG-70-80-110 Disarming Conditions*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-100-00005906.0001001 / 02 OCT 14
Applicable to: ALL

F-G/S* engages, when the aircraft reaches the capture zone of the F-G/S beam, and all the following conditions are applicable:

- F-G/S is armed
- LOC*, LOC, F-LOC*, or F-LOC is engaged.

L2 The aircraft reaches the capture zone of the F-G/S beam, when one of the following occurs:

- Passage far from the F-G/S beam:
  - The F-G/S deviation is less than 2 dots
  - The pitch order is such that F-G/S* will capture the F-G/S beam with a single resource.
- Passage near the F-G/S beam: The F-G/S deviation is less than a threshold depending on the radio altitude.
  This threshold is between 0.1 and 0.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-100-GDISE-00005907.0001001 / 03 DEC 15

F-G/S* disengages, when another vertical mode engages.

L2 F-G/S* also disengages, when one of the following occurs:
- The aircraft becomes established on the F-G/S beam

L3 F-G/S is engaged for more than 15 s, and the F-G/S deviation becomes less than 0.3 dot.

L2 F-G/S engages.
- The flight crew pushes or pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-100-GDISE-00005908.0001001 / 03 DEC 15

L2 REVERSIONS

F-G/S* reverts to V/S / FPA, when one of the following occurs:
- The flight crew presses the APPR pb
  The lateral mode also reverts to HDG/TRACK.
- F-LOC disengages
  The lateral mode also reverts to HDG/TRACK.
- The flight crew presses the LOC pb
- L3 The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
  The lateral mode also reverts to HDG/TRACK.
- L2 The FG detects a difference between both MMRs

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

F-G/S Mode

GENERAL

Ident.: DSC-22-FG-70-80-110-00005909.0001001 / 02 OCT 14
Applicable to: ALL

The FLS Glide Slope track (F-G/S) mode tracks the F-G/S beam.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-80-110-00005910.0001001 / 03 DEC 15
Applicable to: ALL

L3 F-G/S can arm only if all of the following conditions are applicable:
- At least one FMS is operative
- At least one MMR is able to compute the F-LOC and F-G/S deviations
- When both MMRs are operative, the runway headings of the approach that the flight crew selects must be equal in both MMRs.
- The aircraft is above 400 ft RA.
- One of the following mode is not engaged: SRS TO, RWY, RWY TRK, SRS GA, GA TRK.

L1 F-G/S arms, if:
- The flight crew selects an approach in the ARRIVAL page of the FMS, that is compatible with the FLS function (e.g. NDB, NDB/DME, VOR, VOR/DME, RNV(GNSS), LOC only,...)

  Note: *If the NO FLS FOR THIS APPR message appears on the MFD, the FLS function is not applicable..*

- The flight crew presses the APPR pb.

L2 For information on approach selection on the FMS ARRIVAL page, *Refer to DSC-22-FMS-20-20-20 APPR Button*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-110-00005911.0001001 / 03 DEC 15
Applicable to: ALL

L2 F-G/S disarms, when F-G/S* engages.

F-G/S also disarms, when one of the following occurs:
- The flight crew presses the APPR pb, or the LOC pb
- LOC or F-LOC disarms

- LOC*, LOC, F-LOC*, or F-LOC is lost
- The flight crew engages a go-around.
  SRS and GA TRK engage.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-110-00005912.0001001 / 02 OCT 14
Applicable to: ALL

F-G/S engages, when F-G/S* is engaged, and the aircraft becomes established on the F-G/S beam.

L3 The aircraft becomes established on the F-G/S beam, when:
- F-G/S* is engaged for more than 15 s, and
- The F-G/S deviation becomes less than 0.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-110-GDISE-00005913.0001001 / 03 DEC 15

F-G/S disengages when another vertical mode engages.

L2 F-G/S also disengages, when one of the following occurs:
- The flight crew pushes, or pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-110-GDISE-00005914.0001001 / 03 DEC 15

L2 REVERSIONS

F-G/S reverts to V/S / FPA, when one of the following occurs:
- The flight crew presses the APPR pb
  The lateral mode also reverts to HDG/TRACK.
- F-LOC disengages
  The lateral mode also reverts to HDG/TRACK.
- The flight crew presses the LOC pb

L3
- The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
  The lateral mode also reverts to HDG/TRACK.

L2
- The FG detects a difference between both MMRs

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

Intentionally left blank

LOC B/C* Mode

GENERAL

Ident.: DSC-22-FG-70-80-120-00005915.0001001 / 03 DEC 15
Applicable to: ALL

The Localizer Back Course capture (LOC B/C*) mode captures the localizer back beam of the ILS.

ARMING AND DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-120-00005916.0001001 / 02 OCT 14
Applicable to: ALL

LOC B/C* and LOC B/C modes arm (disarm) together and simultaneously.
As a consequence, LOC B/C* arms with the LOC B/C indication on the FMA.
L2 For LOC B/C arming conditions, *Refer to DSC-22-FG-70-80-130 Arming Conditions*.
For LOC B/C disarming conditions, *Refer to DSC-22-FG-70-80-130 Disarming Conditions* .

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-120-00005917.0001001 / 02 OCT 14
Applicable to: ALL

LOC B/C* engages, when LOC B/C is armed, and the aircraft reaches the capture zone of the LOC B/C beam.

L2 CAPTURE ZONE OF THE LOC B/C BEAM

The aircraft reaches the capture zone of the LOC B/C beam, when one of the following occurs:
- The difference between the track and the course of the LOC B/C is less than 115 °, and:
  - The LOC B/C deviation is less than 2.3 dots, and
  - The roll order is such that LOC B/C* will capture the LOC B/C beam with a single turn.
- The difference between the track and the course of the LOC B/C is less than 15 °, and the LOC B/C deviation is less than 1.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-120-GDISE-00005918.0001001 / 03 DEC 15

LOC B/C* disengages, when another lateral mode engages.

L2 LOC B/C* disengages, when one of the following occurs:

- The aircraft becomes established on the LOC B/C beam

L3 When LOC B/C* is engaged with a LOC B/C deviation less than 0.2 dot, during10 s.

L2 LOC B/C engages.

- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged
  HDG/TRACK engages.

  Note: *If a vertical managed mode of approach was previously engaged, LOC B/C* remains engaged, and a vertical mode reversion occurs.*

- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.

L3 - The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.

L2 - The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-120-GDISE-00005919.0001001 / 03 DEC 15

L2 REVERSIONS

LOC B/C* reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- The flight crew inserts a DIRECT TO CRS IN or DIRECT TO CRS OUT in the active flight plan.

L3 - The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.

L2 - The FG detects a difference between both MMRs.

When LOC B/C* reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA.

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

LOC B/C Mode

GENERAL

Ident.: DSC-22-FG-70-80-130-00005920.0001001 / 02 OCT 14
Applicable to: ALL

The Localizer Back Course track (LOC B/C) mode tracks the localizer back course beam of the ILS.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-80-130-00005921.0001001 / 03 DEC 15
Applicable to: ALL

L2 LOC B/C can only arm when all of the following are applicable:
- HDG/TRACK or NAV is engaged
- L3 The aircraft is above 400 ft RA.

L1 LOC B/C arms, when:
- The flight crew selected a BAC approach on the FMS ARRIVAL page, and
- The flight crew presses the APPR pb, or the LOC pb.
- L3 At least one LS receiver must be operative. If both receivers are operative, the LS parameters must be the same in both LS receivers.

L2 For information on approach selection on the FMS ARRIVAL page, *Refer to DSC-22-FMS-20-20-20 APPR Button*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-130-00005922.0001001 / 02 OCT 14
Applicable to: ALL

L2 LOC B/C disarms, when one of the following occurs:
- F-G/S is armed, and the flight crew presses the APPR pb
- F-G/S is not armed, and the flight crew presses the LOC pb
- L3 NAV arms
- The flight crew engages go-around
- The flight crew modifies the approach selection.
- The ILS frequency and course are not equal in both ILS receivers.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-130-00005923.0001001 / 03 DEC 15
Applicable to: ALL

LOC B/C engages, when LOC B/C* is engaged, and the aircraft becomes established on the LOC B/C beam.

L3 The aircraft becomes established on the LOC B/C beam, when LOC B/C* is engaged with a LOC B/C deviation less than 0.2 dot, during 10 s.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-130-GDISE-00005924.0001001 / 03 DEC 15

LOC B/C disengages, when another lateral mode engages.

L2 LOC B/C disengages, when one of the following occurs:

- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged.
  HDG/TRACK engages.
- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- L3 The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.
- L2 The flight crew performs a go-around
  SRS GA and GA TRK engage.

Ident.: DSC-22-FG-70-80-130-GDISE-00005925.0001001 / 03 DEC 15

L2 REVERSIONS

LOC B/C reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- The flight crew inserts a DIRECT TO CRS IN or DIRECT TO CRS OUT in the active flight plan.
- L3 The flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the POS/NAVAIDS page.
- L2 The FG detects a difference between both MMRs.

When LOC B/C reverts to HDG/TRACK, the vertical mode also reverts to V/S / FPA.

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

Intentionally left blank

APP-DES

GENERAL

Ident.: DSC-22-FG-70-80-140-00012873.0001001 / 03 OCT 16
Applicable to: ALL

The approach and descent mode (APP DES) tracks the vertical FMS profile for an RNAV(RNP) approach, or an RNAV visual approach.
When engaged, the approach and descent mode disregards the altitude that is set on the FCU to follow the vertical FMS profile with all the vertical constraints of the flight plan.

ARMING CONDITIONS

Ident.: DSC-22-FG-70-80-140-00019005.0001001 / 04 OCT 16
Applicable to: ALL

APP-DES arms, when all the following conditions are applicable:
- The flight crew presses the APPR pb
- NAV is armed, or can be armed, or NAV is engaged
- The approach selected in the ARRIVAL page of the FMS is compatible with the APP-DES mode (RNAV(RNP), or RNAV visual)

L12

Note: *Only if an RNAV visual approach is selected, the flight crew must also deselect the FLS via the POSITION NAVAIDS FMS page to enable APP-DES arming.*
For more information, Refer to DSC-22-FMS-20-20-20 DESELECT FLS Button

L2
- The FMS flight phase is either cruise (CRZ), descent (DES) or approach (APPR)

Note: *if the NAV mode is not armed or engaged when the flight crew presses the APPR pb, NAVarms at the same time.*

L3 The aircraft must be above 400 ft RA.

L2 For information on approach selection on the FMS ARRIVAL page, *Refer to DSC-22-FMS-20-20-20 APPR Button*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-80-140-00019007.0001001 / 02 OCT 14
Applicable to: ALL

L2 APP DES disarms, when one of the following occurs:
- The flight crew presses the APPR pb
  The lateral mode (NAV) remains armed or engaged
- NAV disarms, or NAV disengages

- The flight crew performs a go around, and SRS engages
- The FMS vertical profile is lost
- The TCAS mode engages.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-80-140-00012874.0001001 / 02 OCT 14
Applicable to: ALL

APP DES engages when all the following conditions are applicable:

- NAV is engaged
- APP-DES is armed or can be armed
- The aircraft is in the capture zone of the vertical FMS profile

L2 The vertical capture zone above and below the vertical FMS profile is defined as follows:

- 250 ft above, and 50 ft below a steady FMS altitude
- 250 ft above and below an FMS descent path.

- The FMS flight phase is either cruise (CRZ), descent (DES) or approach (APPR).

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22-FG-70-80-140-G10-00019016.0001001 / 02 OCT 14

APP DES disengages when another vertical mode engages.

L2 APP DES disengages, when one of the following occurs:

- The flight crew pushes, or pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around and SRS GA engages.

Ident.: DSC-22-FG-70-80-140-G10-00019017.0001001 / 02 OCT 14

L2 REVERSION

APP DES reverts to V/S / FPA, when one of the following occurs:

- NAV disengages
  The lateral mode also reverts to HDG/TRACK.
- The flight crew presses the APPR pb
  The lateral mode remains engaged in NAV .

- The FMC-A and the FMC-B are failed, or the vertical flight plan is lost
- The FMS flight phase is no longer cruise (CRZ), descent (DES), or approach (APPR)

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The pitch and roll bars of the FDs flash for 10 s.

Intentionally left blank

General

GENERAL

Ident.: DSC-22-FG-70-90-10-00005926.0001001 / 02 OCT 14
Applicable to: ALL

When the flight crew initiates a go-around, the SRS GA vertical mode engages. In addition, one of the following occurs:

- If a lateral managed mode is engaged (except NAV mode), GA TRK engages, and NAV mode arms
  NAV automatically engages as soon as the aircraft reaches the capture zone of the flight plan active leg.

L2 *Note: If a HDG(TRK) was preset, NAV mode does not arm. GA TRK engages, until the flight crew pulls the HDG/TRK knob to follow the preset target.*

Example: Go-around during a Precision Approach

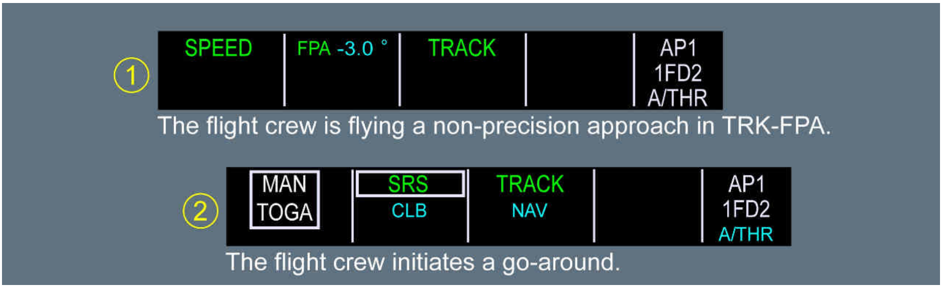
The flight crew is flying a non-precision approach in HDG-V/S.

The flight crew initiates a go-around.

Example: Go-around during a Non-Precision Approach in TRK-FPA



①
SPEED
FPA -3.0 °
TRACK
AP1
1FD2
A/THR
②
MAN
TOGA
SRS
CLB
TRACK
NAV
AP1
1FD2
A/THR

The flight crew is flying a non-precision approach in TRK-FPA.

The flight crew initiates a go-around.

L2 Note: *If the flight crew initiates the go-around below 100 ft RA, GA TRK engages, and NAV mode arms, until 100 ft.*
Then, NAV automatically engages, if the aircraft is in the capture zone of the flight plan active leg.

L1 In addition, at go-around engagement :
- The FMS flight phase becomes go-around
- If not previously engaged, the FDs automatically engage
- HDG-V/S is automatically selected, except if the TRK mode was engaged before go-around
  For more information, *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection*.
- If previously displayed, the FPV (VV) disappears, except if the TRK mode was engaged before the go-around

The FMS flight phase changes from go-around to climb, when one of the following modes engages: Altitude acquire mode, altitude hold mode, OP CLB, V/S / FPA.
However, the FMS flight phase will change from climb to cruise, if ALT CRZ* or ALT CRZ engages. This occurs, when the aircraft approaches the AFS CP selected altitude, and the cruise altitude is the AFS CP selected altitude.
For more information on FMS flight phase transitions, *Refer to DSC-22-FMS-10-50-30 Overview*.
The vertical flight plan is not available when the FMS flight phase is go-around. It becomes available when the FMS flight phase becomes climb or cruise.
When SRS GA engages, the speed target becomes managed. The managed speed target is the aircraft speed at SRS GA engagement.
L2 For more information on the managed speed target limits, *Refer to DSC-22-FG-60-20 Managed Speed/Mach Target*.
L1 When SRS GA disengages, the managed speed target will be the speed target provided by the FMS, in accordance with the FMS flight phase.

Note: *If the FMS flight phase is cruise, the SPD LIM, and SPD CSTR are still respected (when applicable).*

SRS GA Mode

GENERAL

Ident.: DSC-22-FG-70-90-20-00005927.0001001 / 03 DEC 15
Applicable to: ALL

The Speed Reference System (SRS) mode is a managed vertical mode. This mode is applicable during takeoff and go-around. This chapter is only about the SRS mode during go-around, also referred to as SRS GA mode.
The FMA displays SRS, when the SRS GA mode engages.
The SRS GA controls the speed target via the elevators.

L2 The guidance law also includes:
- A flight path angle protection, that ensures a positive climb
- A pitch angle protection to reduce the aircraft nose-up (15 ° of maximum pitch attitude).
- A speed protection, that ensures the aircraft does not exceed VFE.

L1 The speed target is the memorized aircraft speed at SRS GA engagement.
L2 The lower limit of the target is the VAPP that the PRIMs memorize at 700 ft RA.

The higher limit of the target is the lowest value between:
- 25 kt above VLS (or 15 kt above VLS when one engine is inoperative)
- 5 kt below VMAX.

L1 *Note:* *At SRS GA engagement, the speed becomes managed.*

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-90-20-00005928.0002001 / 03 APR 20
Applicable to: ET-AYA

SRS GA engages when all of the following conditions are applicable:
- The aircraft is airborne, or on ground for less than 30 s
- The flight crew sets a thrust lever at the TOGA detent
- The slat or the flaps are extended, or in clean configuration with the aircraft below the AFS CP altitude and below 2 500 ft RA.

SRS GA mode can be engaged regardless of the vertical mode (except SRS TO).

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-90-20-00005928.0001001 / 03 SEP 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYB

SRS GA engages when all of the following conditions are applicable:
- The flight crew sets a thrust lever at the TOGA detent
- The slat or the flaps are extended, or the flap lever is not at the 0 position
- L2 The aircraft is airborne, or on ground for less than 30 s.

L1 SRS GA mode can be engaged regardless of the vertical mode (except SRS TO).

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-90-20-00005929.0001001 / 03 SEP 14
Applicable to: ALL

L3 SRS GA can disengage only when the aircraft is above 100 ft RA.

L1 SRS GA disengages when one of the following occurs:
- OP CLB, or CLB is armed, and the aircraft reaches the GA acceleration altitude
  OP CLB , or CLB engages.
  The GA acceleration altitude is displayed on the G.A panel of the PERF page of the FMS.

L3 *Note:* *ALT CST* and ALT CST will not engage at or below the GA acceleration altitude, even if all of the following conditions are applicable:*
- *An altitude constraint associated to a waypoint has the same altitude than the GA acceleration altitude*
- *The AFS CP selected altitude is set above the GA acceleration altitude*
- *NAV armed or engaged.*

- L1 The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
  L3 This scenario is possible, if the aircraft is above 400 ft RA.
- L1 The flight crew presses the ALT pb
  ALT engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew pulls or pushes the V/S / FPA knob
  V/S / FPA engages.
- L2 The AFS CP selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob.
  OP CLB engages.

GA TRK Mode

GENERAL

Ident.: DSC-22-FG-70-90-30-00005930.0001001 / 03 SEP 14
Applicable to: ALL

The GA TRK mode is a managed lateral mode that is applicable during go-around.
The GA TRK mode maintains the track of the aircraft, when the mode engages.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-90-30-00005931.0002001 / 03 APR 20
Applicable to: ET-AYA

GA TRK engages, when all of the following conditions are applicable:
- The aircraft is airborne, or on ground for less than 30 s
- The flight crew sets a thrust lever to TOGA
- The slats or the flaps are extended, or in clean configuration with the aircraft below the AFS CP altitude and below 2 500 ft RA
- NAV, HDG, or TRK is not engaged

L3 GA TRK can engage if one of these modes is engaged, provided that the aircraft is below 100 ft
- SRS TO is not engaged.

L1 GA TRK simultaneously engages with SRS GA.

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-90-30-00005931.0001001 / 03 SEP 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYB

GA TRK engages, when all of the following conditions are applicable:
- L2 The aircraft is airborne, or on ground for less than 30 s
- L1 The slats, or the flaps are extended, or the flap lever is not at the 0 position
- The flight crew sets a thrust lever to TOGA
- NAV, HDG, or TRK is not engaged

L3 GA TRK can engage if one of these modes is engaged, provided that the aircraft is below 100 ft
- SRS TO is not engaged.

L1 GA TRK simultaneously engages with SRS GA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-90-30-00005932.0001001 / 03 SEP 14
Applicable to: ALL

GA TRK disengages, when one of the following occurs:

- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- NAV is armed, and the aircraft reaches the capture zone of the active leg
  NAV engages.
- L2 The flight crew performs a DIRECT TO.
  NAV engages.

L3 GA TRK cannot be disengaged below 100 ft RA.

General

GENERAL

Ident.: DSC-22-FG-70-100-10-00005933.0001001 / 03 SEP 14
Applicable to: ALL

The AP/FD TCAS mode is an AP/FD vertical mode, that provides vertical guidance in the case of a Resolution Advisory alert, generated by the Traffic Collision Avoidance System (TCAS).

L2 For more information on the TCAS, *Refer to DSC-34-SURV-40-10 Overview*.

L1 When a Traffic Advisory is triggered, the AP/FD TCAS mode arms.

When a Resolution Advisory is triggered, the AP/FD TCAS mode engages to provide guidance in accordance with the Resolution Advisory order:
- The AP status does not change: Remains engaged or disengaged
- If the FDs are disengaged, they automatically engage.

When the "CLEAR OF CONFLICT" aural alert sounds, the AP/FD TCAS mode disengages. The AP/FD provides guidance toward the AFS CP selected altitude.

AP/FD TCAS MODE AVAILABILITY

Ident.: DSC-22-FG-70-100-10-00005934.0001001 / 03 SEP 14
Applicable to: ALL

The AP/FD TCAS mode is available, when all of the following conditions are met:
- TCAS 1 or TCAS 2 is available
- TCAS is in TA/RA mode
- At least one AP, or one FD, is available
- The AP/FD TCAS mode is not failed (i.e. the ECAM did not trigger the AUTO FLT TCAS MODE FAULT alert).

When the AP/FD TCAS mode is available, the AP/FD TCAS mode can arm or engage.

Intentionally left blank

Arming and Disarming Conditions

ARMING CONDITIONS

Ident.: DSC-22-FG-70-100-20-00005935.0001001 / 03 SEP 14
Applicable to: ALL

L2 To arm, the AP/FD TCAS mode must be available. For more information, *Refer to DSC-22-FG-70-100-10 AP/FD TCAS Mode Availability*.

L1 The AP/FD TCAS mode arms, when

- A Traffic Advisory (TA) alert is triggered, or
- An intruder enters within the TA range.

L2 This usually occurs at the end of a Resolution Advisory, when the "CLEAR OF CONFLICT" aural alert sounds.

L1 The AP/FD TCAS mode arms, even if both APs, and both FDs are disengaged. In this case, the APs and FDs remain disengaged. For more information, *Refer to DSC-22-FG-70-100-40 Introduction*.

DISARMING CONDITIONS

Ident.: DSC-22-FG-70-100-20-00005936.0001001 / 03 SEP 14
Applicable to: ALL

The AP/FD TCAS mode disarms, when one of the following occurs:

- The intruder becomes white on the ND
- The AP/FD TCAS mode engages upon a Resolution Advisory alert
- L2 The TA ONLY mode of the TCAS is selected
- The STANDBY mode of the TCAS is selected
- The AP/FD TCAS mode fails (i.e the ECAM triggers the AUTO FLT TCAS MODE FAULT alert).

Intentionally left blank

Engagement and Disengagement Conditions

ENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-100-30-00005937.0001001 / 03 SEP 14
Applicable to: ALL

L2 To engage, the AP/FD TCAS mode must be available. For more information, *Refer to DSC-22-FG-70-100-10 AP/FD TCAS Mode Availability*.

L1 The AP/FD TCAS mode engages, when a Resolution Advisory is triggered.
The AP/FD TCAS mode engages, even if both APs, and both FDs are disengaged. In this case, the FDs automatically engage. For more information, *Refer to DSC-22-FG-70-100-40 Introduction*.

L2 *Note:* *When the AP/FD TCAS mode engages, the triple click audio indicator does not sound, and the FD pitch bar does not flash.*

DISENGAGEMENT CONDITIONS

Ident.: DSC-22-FG-70-100-30-00005938.0001001 / 03 SEP 14
Applicable to: ALL

The AP/FD TCAS mode automatically disengages, when the "CLEAR OF CONFLICT" aural alert sounds.
Then the AP/FD engages in a vertical mode that leads the aircraft toward the target altitude set on the AFS CP. For more information, *Refer to DSC-22-FG-70-100-40 Introduction*.

L2 The AP/FD TCAS mode also automatically disengages, if one of the following occurs:
- The TA ONLY mode of the TCAS is selected, or
- The STANDBY mode of the TCAS is selected, or
- The ECAM triggers the AP/FD AUTO FLT TCAS MODE FAULT alert, or
- The flight crew engages another AP/FD vertical mode (e.g. in the case of go-around).

Intentionally left blank

Normal Operations

WHEN A TRAFFIC ADVISORY IS TRIGGERED

Applicable to: ALL

Ident.: DSC-22-FG-70-100-40-GNTA-00005939.0001001 / 03 SEP 14

When a Traffic Advisory (TA) alert is triggered, the TCAS mode arms.

Ident.: DSC-22-FG-70-100-40-GNTA-00005942.0001001 / 03 SEP 14

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode arms, the AP and FDs engagement status does not change.

Ident.: DSC-22-FG-70-100-40-GNTA-00005943.0001001 / 03 SEP 14

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode arms, any engaged(armed) AP/FD lateral mode remains engaged(armed).

Ident.: DSC-22-FG-70-100-40-GNTA-00005944.0001001 / 03 SEP 14

CONSEQUENCE ON AP/FD VERTICAL MODE

When the AP/FD TCAS mode arms, any armed(engaged) AP/FD vertical mode remains armed(engaged).
The FMA displays TCAS on the third line of the second column. Therefore, if another AP/FD vertical mode is armed, the FMA displays both modes.

WHEN A RESOLUTION ADVISORY IS TRIGGERED

Applicable to: ALL

Ident.: DSC-22-FG-70-100-40-GNRA-00005940.0001001 / 03 SEP 14

At occurrence of any preventive or corrective Resolution Advisory (RA), the AP/FD TCAS mode engages. It provides vertical guidance in accordance with the TCAS vertical speed orders.

Ident.: DSC-22-FG-70-100-40-GNRA-00005945.0001001 / 03 SEP 14

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode engages:
- The AP engagement status does not change
- If both FDs are disengaged, the FDs automatically engage.

Ident.: DSC-22-FG-70-100-40-GNRA-00005946.0001001 / 03 SEP 14

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode engages, any engaged(armed) AP/FD lateral mode remains engaged(armed).
If both APs and both FDs are disengaged, when the AP/FD TCAS mode engages, HDG automatically engages. The heading target is the aircraft heading at HDG engagement.

Ident.: DSC-22-FG-70-100-40-GNRA-00005947.0001001 / 03 JUL 20

1 CONSEQUENCE ON AP/FD VERTICAL MODE

GUIDANCE

Depending on the Resolution Advisory (RA) and the AFS CP selected altitude, the AP/FD TCAS mode uses the guidance law of one of the following modes: V/S, altitude acquire, or altitude hold.

V/S guidance

The AP/FD TCAS mode uses the guidance law of the V/S mode if:
- ALT (ALT CRZ) is not armed, or
- The capture(hold) of the AFS CP selected altitude is not compatible with the RA order.

The vertical speed target is one of the following values:
- The aircraft vertical speed at the engagement of the AP/FD TCAS mode, if a preventive RA is triggered, or
- The limit between the green and red area of the vertical speed scale, plus(minus) 200 ft/min if the aircraft should climb(descend).

L2 In AP/FD TCAS mode, the load factor authority of the guidance law is increased, and can reach ± 0.3 g. The AP/FD TCAS mode ensures that the aircraft speed remains between 5 kt below VLS and VMAX.

L1 *Note: In order to ensure a rapid response to the RA, the initial vertical speed may temporarily exceed the vertical speed target of the TCAS. The peak of the vertical speed is reached in less than 5 s after the vertical speed enters the TCAS green area.*

If the Resolution Advisory order changes, the AP/FD TCAS mode follows the new target.

Altitude acquire(hold) guidance

The AP/FD TCAS mode uses the guidance law of the ALT(ALT CRZ)(ALT*)(ALT CRZ*) mode if:
- ALT(ALT CRZ) is armed
- The capture(hold) of the AFS CP selected altitude is compatible with the RA order.

L2 For more information, See Capture of the selected altitude in TCAS mode.

L1 AP/FD VERTICAL MODE ENGAGED AT OCCURRENCE OF THE RA

When the AP/FD TCAS mode engages, any engaged AP/FD vertical mode disengages.

L2 *Note:* *If G/S(F-G/S) is engaged, when the AP/FD TCAS mode engages:*
- *G/S(F-G/S) disengages*
- *The APPR pb comes off, and the LOC pb comes on.*

L1 AP/FD VERTICAL MODE ARMED AT OCCURRENCE OF THE RA

When the AP/FD TCAS mode engages, any armed AP/FD vertical mode disarms, except ALT(ALT CRZ) if the altitude capture is compatible with the RA order.

L2 *Note:* *If G/S(F-G/S) is armed, when the AP/FD TCAS mode engages:*
- *G/S(F-G/S) disarms*
- *The APPR pb comes off, and the LOC pb comes on.*

Capture of the Selected Altitude in TCAS mode

If ALT(ALT CRZ) is armed, when the AP/FD TCAS mode engages:
- ALT(ALT CRZ) remains armed if the capture of the AFS CP selected altitude is compatible with the Resolution Advisory order, and if the selected level is reached before the clear of conflict.
  L3 If ALT(ALT CRZ) is armed, and ALT capture conditions occur during the Resolution Advisory, the AP/FD TCAS mode captures the AFS CP selected altitude (without ALT* indicated on the FMA).
  L2 This can occur when the TCAS triggers a preventive RA "MONITOR VERTICAL SPEED", or a corrective RA "ADJUST VERTICAL SPEED, ADJUST".
  L3 However, if the vertical speed order of the Resolution Advisory is zero, ALT(ALT CRZ) disarms.
- L2 ALT(ALT CRZ) disarms, if the capture of the AFS CP selected altitude is not compatible with the Resolution Advisory order.

White Box on FMA

When a vertical mode disarms at TCAS mode engagement, the FMA displays a white box for 10 s.

Ident.: DSC-22-FG-70-100-40-GNRA-00005948.0001001 / 03 SEP 14

CONSEQUENCE ON THE FLYING REFERENCE

When the AP/FD TCAS mode engages, the flying reference automatically becomes HDG-V/S.

When the AP/FD TCAS mode disengages (e.g. at the CLEAR OF CONFLICT), the FMA displays the TRK FPA DESELECTED message for 10 s on the third line, if the previous flying reference was TRK-FPA.

Ident.: DSC-22-FG-70-100-40-GNRA-00005949.0001001 / 03 SEP 14

CONSEQUENCE ON A/THR AND SPEED/MACH CONTROL

When the AP/FD TCAS mode engages:

- If the A/THR is disconnected, it becomes armed or active, depending on the thrust lever position
- If the A/THR is armed, it remains armed
- If the A/THR is active, it remains active.

A/THR ACTIVE

When the AP/FD TCAS mode engages, if the A/THR becomes(remains) active, the SPEED/MACH mode engages.
The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the occurrence of the Resolution Advisory (RA).

L2 If a new RA order occurs, the speed/Mach target changes, and becomes the aircraft speed/Mach at the occurrence of the new RA.

L1 A/THR ARMED

When the AP/FD TCAS mode engages, if the A/THR becomes(remains) armed, the thrust target does not change.
The FMA displays the A/THR message, in accordance with the thrust lever position (e.g. MAN THR, MAN TOGA).

L2 *Note:* *If the flight crew sets the thrust levers to the CL detent, the A/THR activates. The SPEED/MACH mode engages. The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the A/THR activation.*

L1 LVR CLB Message on the FMA

In the case of AP/FD TCAS mode engagement when the A/THR is armed (e.g. Resolution Advisory order before the thrust reduction altitude), the LVR CLB message may flash on the FMA:

- If the vertical speed order of the resolution advisory is above 500 ft/min, the LVR CLB message is inhibited
  However, if the speed becomes greater than $VFE - 20$, the LVR CLB message flashes on the FMA.
- If the vertical speed order of the Resolution Advisory is equal to, or below 500 ft/min, the LVR CLB message flashes on the FMA.

WHEN CLEAR OF CONFLICT

Applicable to: ALL

Ident.: DSC-22-FG-70-100-40-GNCOC-00005941.0001001 / 03 SEP 14

When the "CLEAR OF CONFLICT" aural alert sounds, the AP/FD TCAS mode automatically disengages. The AP/FD provides guidance toward the previous AFS CP selected altitude.

Ident.: DSC-22-FG-70-100-40-GNCOC-00005950.0001001 / 03 SEP 14

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode disengages, any engaged(armed) AP/FD lateral mode remains engaged(armed).

Ident.: DSC-22-FG-70-100-40-GNCOC-00005951.0001001 / 03 SEP 14

CONSEQUENCE ON AP/FD VERTICAL MODE

When the AP/FD TCAS mode disengages, one of the following modes engages: V/S, ALT*, ALT, ALT CRZ*, or ALT CRZ:

- In the case of an altitude capture or hold during TCAS mode engagement (*Refer to DSC-22-FG-70-100-40 Consequence on AP and FD*), the TCAS mode may revert to ALT*(ALT CRZ*), or ALT(ALT CRZ) when clear of conflict.
- In all other cases, the TCAS mode reverts to V/S mode when clear of conflict.

TCAS MODE REVERSION TO V/S

When the AP/FD TCAS mode reverts to V/S when clear of conflict, all of the following occurs:

- ALT or ALT CRZ arms

L3 However, ALT does not arm in the following cases:

  - A preventive Resolution Advisory occurred, when one of the following modes was engaged: G/S*, G/S, F-G/S*, or F-G/S
  - The AFS CP selected altitude is above the aircraft altitude.

L1
- A triple click audio indicator sounds, and the pitch bar flashes for 10 s
- The vertical speed target depends on whether a preventive Resolution Advisory occurred, or a corrective Resolution Advisory occurred.

Vertical Speed Target - A Preventive Resolution Advisory Occurred

The vertical speed target remains the vertical speed target at the triggering of the Resolution Advisory.

Vertical Speed Target - A Corrective Resolution Advisory Occurred

The vertical speed target becomes:
- 500 ft/min, if the aircraft is at, or above 30 000 ft, and the AFS CP selected altitude is above the aircraft
- ±1 000 ft/min, in all other cases.
  V/S leads the aircraft toward the AFS CP selected altitude.

TCAS MODE REVERSION TO ALT(ALT CRZ)(ALT*)(ALT CRZ*)

If ALT(ALT CRZ) is armed, when the AP/FD TCAS mode disengages:
- ALT*(ALT CRZ*) engages, if the aircraft is within the capture zone of the AFS CP selected altitude
- ALT(ALT CRZ) engages, if the aircraft altitude is equal to the AFS CP selected altitude.
- In all other cases, V/S engages.

Inhibition Conditions

INHIBITION CONDITIONS

Ident.: DSC-22-FG-70-100-50-00005952.0001001 / 03 NOV 16
Applicable to: ALL

The AP/FD TCAS mode arming and engagement are inhibited when the TCAS is in Traffic Advisory only (TA ONLY) mode or in Standby (STBY) mode.

L2 For more information on the manual or automatic selection of the TA ONLY mode, *Refer to DSC-34-SURV-40-10 TA ONLY Mode*.
For more information on the selection of the STBY mode, *Refer to DSC-34-SURV-40-10 Standby Mode*.

L1 If the TA ONLY (STBY) mode of the TCAS is automatically or manually selected during a Traffic Advisory, the AP/FD TCAS mode automatically disarms.
If the TA ONLY (STBY) mode of the TCAS is automatically or manually selected during a Resolution Advisory, the AP/FD TCAS mode automatically disengages.

When the AP/FD TCAS mode disengages, all of the following simultaneously occurs:

1. The AP/FD TCAS mode reverts to V/S
   A triple click audio indicator sounds and the FD pitch bar flashes for 10 s
   L2 If the Resolution Advisory order was to descend, the vertical speed target becomes 0 ft/min.
   If not, the vertical speed target remains equal to the vertical speed target at the TCAS mode engagement.
2. L1 The AP/FD lateral mode remains engaged
3. The FMA displays the TCAS RA INHIBITED message on the second and third columns of the third line.

Intentionally left blank

Takeoff

INTRODUCTION

Ident.: DSC-22-FG-70-110-20-00005953.0001001 / 04 SEP 14
Applicable to: ALL

For scenario examples on takeoff:
- *Refer to DSC-22-FG-70-110-20 Takeoff with NAV*
- *Refer to DSC-22-FG-70-110-20 Takeoff with HDG/TRK Preset*.

TAKEOFF WITH NAV

Ident.: DSC-22-FG-70-110-20-00005954.0001001 / 04 SEP 14
Applicable to: ALL

NAV and CLB arm when the aircraft is on ground, and:
- The FDs are engaged
- A runway and a SID are selected in the flight plan
- V2 is inserted in the T.O panel of the FMS PERF page
- TOGA is selected in the T.O panel of the FMS PERF page
- The AFS CP selected altitude is set above the acceleration altitude
- The slats are extended.

When the aircraft approaches the runway threshold, and the LOC signal is available, RWY arms.
When the aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA, SRS TO and RWY engage, and MAN TOGA appears on the FMA.
At least five seconds after liftoff, the flight crew can engage one AP.
At 30 ft RA, RWY disengages, and NAV engages.
When the aircraft reaches the thrust reduction altitude, LVR CLB flashes. The flight crew sets the thrust levers to CL, MAN TOGA disappears, and THR CLB engages.
At the acceleration altitude, SRS TO disengages, and CLB engages.
From liftoff to the acceleration altitude, the managed speed target is V2+10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

TAKEOFF WITH HDG/TRK PRESET

Ident.: DSC-22-FG-70-110-20-00005955.0001001 / 03 JUL 20
Applicable to: ALL

1

OP CLB arms when the aircraft is on ground, and:
- The FDs are engaged
- A runway is selected in the flight plan
- V2 is inserted in the T.O panel of the FMS PERF page
- TOGA is selected in the T.O panel of the FMS PERF page
- The AFS CP selected altitude is set above the acceleration altitude

- The flight crew turned the HDG/TRK knob on the AFS CP to select a heading (or track) preset The HDG/TRK window displays the heading (or track). The display remains, as long as RWY, RWY TRK, and HDG (or TRACK) are engaged.
- The slats are extended.

When the aircraft approaches the runway threshold, and the LOC signal is available, RWY arms.
When the aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA, SRS and RWY engage, and MAN TOGA appears on the FMA.
At least five seconds after liftoff, the flight crew can engage one AP.
At 50 ft RA, RWY disengages, and RWY TRK engages.
When the flight crew pulls the HDG/TRK knob, HDG engages (HDG-V/S is selected).
At the thrust reduction altitude, THR CLB engages.
At the acceleration altitude, OP CLB engages.
From liftoff to the acceleration altitude, the managed speed target is V2 + 10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

Applicable to: ALL

If CLB and NAV are engaged and NAV disengages, CLB disengages, and OP CLB engages.

The transition from CLB to OP CLB is a reversion with a triple click, if NAV disengages due to one of the following conditions:
- The aircraft reaches a flight plan discontinuity
- The next altitude target is an altitude constraint, and the flight crew engages HDG/TRACK mode.

GENERAL

Applicable to: ALL

Ident.: DSC-22-FG-80-G10-00012950.0001001 / 06 AUG 14

The approach and landing capability provides the flight crew with the aircraft capability to perform an approach, and land the aircraft.
The flight guidance system computes the aircraft approach and landing capability, and displays this capability on the FMA.

L2 The PRIM and the FCDC computes the aircraft approach and landing capability.

L1 The approach and landing capability depends on:
- The availability of aircraft systems, and functions
- The type of approach the flight crew selected as LS on the FMS POSITION/NAVAIDS page.

L2 For more information about the minimum required equipment to compute approach and landing capabilities, *Refer to LIM-AFS-20 Required Equipment for ILS CAT II/III Approach with Autoland*.

L1 The approach and landing capability enables the flight crew to determine:
- The available minima of the approach
- The available landing technique.

L2 *Note:* *If the autoland capability is not available, the DISCONNECT AP FOR LDG message appears on the FMA when the aircraft is below 150 ft.*
For more information, Refer to DSC-22-FG-90-80 AFS Messages (Line 3)

Ident.: DSC-22-FG-80-G10-00013039.0001001 / 08 JUL 19

The flight guidance system computes the following approach and landing capabilities of the aircraft:

Approach and Landing Capability	Type of Approach Selected	Available FMA Guidance	Lowest Available Minima	Aircraft Landing Capability
LAND3 DUAL	ILS CAT I, II, III	LOC - G/S	Down to CAT III B or C	Autoland
LAND3 SINGLE	ILS CAT I, II, III	LOC - G/S	Down to CAT III A	Autoland
LAND2	ILS CAT I, II	LOC - G/S	Down to CAT II	Autoland
LAND1	GLS	LOC - G/S	Down to CAT I	Autoland

Continued on the following page

Continued from the previous page

Approach and Landing Capability	Type of Approach Selected	Available FMA Guidance	Lowest Available Minima	Aircraft Landing Capability
APPR1	ILS CAT I, or GLS ◁	LOC - G/S	Down to CAT I	Manual landing
	RNAV(GNSS) with LPV minima (with SLS ◁ option).	LOC - G/S	Down to LPV	Manual landing
	RNAV(GNSS) with LP minima (with SLS ◁ option).	LOC - FPA	Down to LP	Manual landing
F-APP or F-APP+RAW	Approaches that are available in FMS database with the FLS function, as: - ILS with glideslope out - LOC only with no glideslope - LOC B/C - NAVAIDS approach	LOC - F-G/S or LOC B/C - F-G/S or F-LOC - F-G/S	Down to MDA/H	Manual landing
F-APP	RNAV(GNSS) approach with LNAV/VNAV or LNAV only minima.	F-LOC - F-G/S	Down to LNAV-VNAV or LNAV	Manual landing
RAW ONLY	All approaches that are not compatible with FLS function or not available in FMS database.	NAV - FPA or TRK - FPA	Down to MDA/H	Manual landing

FAIL CONCEPT

Ident.: DSC-22-FG-80-00013040.0001001 / 06 AUG 14
Applicable to: ALL

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic system allows the aircraft to complete the approach, flare, and landing.
The LAND3 DUAL approach and landing capability is fail-operational automatic landing system.

Note: In the event of a failure, the automatic landing system operates as a fail-passive system.

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition, or deviation of flight path or attitude, but the landing is not completed automatically.

The following approach and landing capabilities are fail-passive automatic landing system.

- LAND3 SINGLE

- LAND2
- LAND1

Note: With a fail-passive automatic landing system, the flight crew controls the aircraft after a failure.

DISPLAY

Ident.: DSC-22-FG-80-00013037.0002001 / 05 NOV 15
Applicable to: ALL

DISPLAY

The approach and landing capability is displayed on the fifth column of the FMA and HUD, when:

- An LS approach is manually or automatically selected on the FMS POSITION/NAVAIDS page.
- The flight crew presses one of the following pushbutton on the AFS CP:
  - The LS pb
  - The LOC pb
  - The APPR pb.

The FMAs displays the approach and landing capability in accordance with the state of the aircraft systems, and the flight guidance systems that are engaged.

Note: No approach and landing capability is displayed when an RNAV RNP AR approach is selected in the FMS.

L3 If the PRIM and the FCDC are not able to compute the approach and landing capability, the Control and Display System (CDS) displays the APPR1 capability on the FMA, regardless of the FMS flight phase.

L1 APPROACH WITHOUT FLS FUNCTION

Depending on the approach selected, the APPR1 approach and landing capability appears as soon as the flight crew presses one of the LS pb.
The computation of the LAND1(2)(3) approach and landing capability depends on the AP engagement. Therefore, when the flight crew presses the APPR pb to arm or engage the final approach mode, and one or both AP(s) is engaged then LAND1(2)(3) approach and landing capability can be displayed (both APs are necessary for LAND3 DUAL).
However, if the North reference is TRUE, the APPR1 is the only available capability.

L3 *Note:*

1. *LAND1(2)(3) approach and landing capability is computed only if the aircraft is above 400 ft when the flight crew arms the approach modes.*
2. *Below 200 ft RA, LAND3 SINGLE, or LAND3 DUAL is memorized and remains displayed as long as:*
   - *At least one AP is engaged, and*
   - *LAND, FLARE, or ROLL OUT is engaged.*

L1 APPROACH WITH FLS FUNCTION

If the flight crew selects an approach with the FLS function, and the active FMS flight phase is CRZ, DES or APPR, the approach and landing capability appears as soon as the flight crew presses the LS pb.

SPD/MACH PB

L13

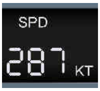
If the speed (Mach) target is selected:
Pressing the SPD/MACH pb changes the speed target to the corresponding Mach target, and vice versa.

Note: *If the speed or Mach is managed:*
Pressing the SPD/MACH pbwill take effect when the speed (Mach) becomes selected.

Ident.: DSC-22-FG-90-20-A-00003723.0001001 / 19 NOV 14

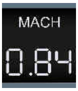
SPD/MACH WINDOW

L13



A speed target is selected.

Note: *1. At the aircraft power-up, the SPD/MACH window displays 100 kt.*
2. If APs, FDs, and A/THR are off, the SPD/MACH will display the current aircraft speed target.



A Mach target is selected.

The speed target is managed.

The Mach target is managed.

Note: *At the speed/Mach crossover altitude, the speed target (managed or selected) automatically changes to a managed Mach target. The display on the SPD/MACH window changes from SPD to MACH (and vice versa in descent). For more information on the crossover altitude, Refer to DSC-22-FMS-10-50-30 DES.*

Ident.: DSC-22-FG-90-20-A-00003724.0001001 / 02 OCT 14

SPD/MACH KNOB

- When turned, preselects a speed or Mach target

  Note: *When the SPD/MACH window is dashed, and if the flight crew begins to turn the knob without pulling it, the window displays:*
  - *The current aircraft speed, if SRS TO, or SRS GA is engaged, or*
  - *The managed speed/Mach target, in all other cases.*

  Then, turning the knob would change the value. If there is no action on the knob for 45 s, the dashes reappear.
- When pulled, activates the selected speed or Mach target
- When pushed, the speed or Mach becomes managed.

L3 One entire rotation of the knob equals 32 kt (1 kt per click), or M 0.32 (M 0.01 per click).

The selection has a range of:
- 100 kt to 399 kt for the speed
- M 0.01 to M 0.99 for the Mach.

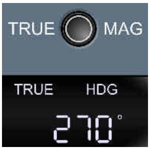
The window displays the HDG/TRK based on the magnetic north reference. When pressed, the North reference changes to the TRUE north reference.



The window displayed the HDG/TRK based on the TRUE north reference.
When pressed, the north reference changes to the magnetic north reference.

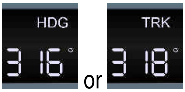
The north reference is magnetic, unless the aircraft is in the polar zone.

When the aircraft reaches the polar zone:
- The following messages ask the flight crew to change from the magnetic reference to the TRUE north reference:
  - The SELECT TRUE NORTH REF memo appears on the ND
  - The NAV EXTREME LATITUDE triggers.
- The north reference automatically changes to TRUE in the ADIRS.

Ident.: DSC-22-FG-90-20-B-00003726.0001001 / 06 AUG 14

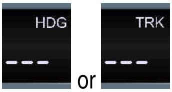
HDG/TRK WINDOW

L13



- A heading/track target is selected, or
- A HDG/TRK preset is defined, or (For more information, *Refer to DSC-22-FG-70-30-20 HDG/TRK Preset*.)
- No AP, and no FD is engaged.

Note: At the aircraft power-up, the HDG/TRK window displays the current aircraft heading.



The lateral guidance is managed.

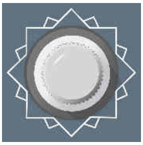
Note: The HDG/TRK window displays TRUE, at the top left corner of the HDG/TRK window, if TRUE is selected with the TRUE/MAG pb.

Ident.: DSC-22-FG-90-20-B-00003727.0001001 / 03 JUL 20

1

HDG/TRK KNOB

L12



- When turned, if in HDG or TRK mode, selects a heading or track target. If not in HDG or TRK mode (HDG / TRK window is dashed), preselects a heading or track target. When the HDG or TRK mode engages (flight crew action, or mode engagement), this preselected value becomes the target

  Note: *The HDG / TRK preset remains if:*

  - *The aircraft is on ground*
  - *The aircraft is in flight and an approach / landing / GO–Around mode is engaged.*

  If not in these conditions, and the HDG or TRK mode is not engaged within 45 s after preselection, the preselected value is cancelled and the dashes reappear.

- When pulled, activates the selected heading or track target
- When pushed, a managed lateral mode arms or engages.

When the target is activated, a change of the value has an immediate effect on the flight guidance.

L3 One entire rotation of the knob equals 32 ° (1 ° per click).

L2 When the flight crew turns the knob clockwise, the aircraft turns in the right direction. When the flight crew turns the knob counterclockwise, the aircraft turns in the left direction.

L3 The selection has a range of 0 ° to 359 °.

Ident.: DSC-22-FG-90-20-B-00003728.0001001 / 06 AUG 14

LOC PB

The lateral approach mode is armed or engaged to perform the approach that is set as a Landing System (LS) on the FMS POSITION/NAVAIDS page.

Depending on the approach set, one of the following AP/FD modes arms or engages:
- LOC
- F/LOC
- LOC B/C.

When pressed, disarms or disengages the approach modes.

L12

There is no approach lateral mode armed.
When pressed, arms or engages the lateral approach modes.
When pressed, displays the LS deviations, if the LS pb of the EFIS CP is off.

Note: *When the approach set in the FMS is an RNP AR type of approach the LOC pb is not available.*

For more information about the approach modes, *Refer to DSC-22-FG-70-80-00 Approach Overview*.

Ident.: DSC-22-FG-90-20-B-00003729.0001001 / 06 AUG 14

HDG-V/S / TRK-FPA PB

HDG
V/S
TRK
FPA

When pressed, selects either:
- HDG-V/S: Heading (HDG) is associated with Vertical Speed (V/S)
  If the VV pb is pressed on the EFIS CP, the associated PFD displays the Velocity Vector (VV) in black.
  For more information on the VV, *Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector*.
- TRK-FPA: Track (TRK) is associated with Flight Path Angle (FPA)
  The PFDs display the Flight Path Vector (FPV) in green.
  For more information on the FPV, *Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector*.

For more information on HDG-V/S / TRK-FPA selection, *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection*.

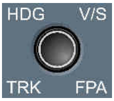
HDG-V/S / TRK-FPA PB



When pressed, selects either:

- HDG-V/S: Heading (HDG) is associated with Vertical Speed (V/S)
  If the VV pb is pressed on the EFIS CP, the associated PFD displays the Velocity Vector (VV) in black.
  For more information on the VV, *Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector*.
- TRK-FPA: Track (TRK) is associated with Flight Path Angle (FPA)
  The PFDs display the Flight Path Vector (FPV) in green.
  For more information on the FPV, *Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector*.

For more information on HDG-V/S / TRK-FPA selection, *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection*.

Ident.: DSC-22-FG-90-20-D-00003734.0001001 / 06 AUG 14

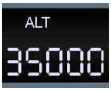
METER PB

When pressed, displays the current and target altitudes in meters (in addition to feet) on the PFDs.
When pressed again, clears the meter display from the PFDs.

Ident.: DSC-22-FG-90-20-D-00003735.0001001 / 06 AUG 14

ALT WINDOW

L13

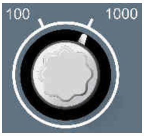


Displays the altitude set by the flight crew with the ALT knob.

Note: *1. The window never displays dashes.*
2. At the aircraft power-up, the ALT window displays the current aircraft altitude, rounded to the nearest hundred.

Ident.: DSC-22-FG-90-20-D-00003736.0001001 / 06 AUG 14

ALT KNOB



- When turned, sets the target altitude on the AFS CP.
  The outer knob has two positions: 100 and 1000, to set the target altitude in increments of 100 ft or 1 000 ft.
- When pulled, activates the selected target altitude on the AFS CP.
  The FMS vertical profile is disregarded.
- When pushed, the altitude target becomes managed, provided that the lateral guidance is also managed.
  The FMS vertical profile is respected, or the AFS CP target altitude is respected, if applicable (*Refer to DSC-22-FG-70-50-10 Introduction*).

Ident.: DSC-22-FG-90-20-D-00003737.0001001 / 06 AUG 14

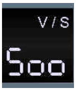
ALT PB

When pressed, the aircraft immediately starts to level-off.

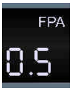
Note: *The ALT pb also comes on, when the aircraft maintains a selected or managed altitude.*

Ident.: DSC-22-FG-90-20-D-00003738.0001001 / 06 AUG 14

V/S / FPA WINDOW

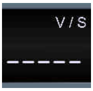


or

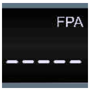


- A V/S / FPA target is selected, or
- No AP, and no FD is engaged.

L13



or

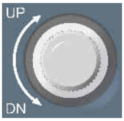


- The vertical profile is managed, or
- The vertical mode is not managed, and the vertical mode is different than V/S or FPA.

Note: *At the aircraft power-up, the V/S / FPA window displays dashes.*

Ident.: DSC-22-FG-90-20-D-00003739.0001001 / 03 JUL 20

2 V/S / FPA KNOB



- When turned, if in V/S or FPA mode, selects a vertical speed or flight path angle target. If not in V/S or FPA mode (V/S / FPA window is dashed), preselects a vertical speed or flight path angle target. When the V/S or FPA mode engages (flight crew action, or mode reversion), this preselected value becomes the target

  Note: *If the V/S or FPA mode is not engaged within 45 s after preselection, the preselected value is cancelled and the dashes reappear.*
- When pulled, activates the selected vertical speed or flight path angle target
- When pushed, activates the selected vertical speed or flight path angle to maintain V/S=0 ft/min or FPA=0 °.

L3 One entire rotation equals 1 600 ft/min in vertical speed (100 ft/min per 2 clicks), or 3.2 ° in flight path angle (0.1 ° per click).

The selection has a range of:
- -6 000 ft/min to +6 000 ft/min for the vertical speed
- -9.9 ° to + 9.9 ° for the flight path angle.

Ident.: DSC-22-FG-90-20-D-00003740.0001001 / 06 AUG 14

APPR PB

Both lateral and vertical approach modes are armed or engaged to perform the approach that is set as a Landing System (LS) on the FMS POSITION/NAVAIDS page.

Depending on the approach set, the following AP/FD modes arm or engage:
- LOC and G/S or
- LOC and F/GS, or
- F/LOC and F/GS, or
- LOC B/C and F/GS, or
- NAV and APP DES.

When pressed, disarms or disengages the approach modes.

L12

There is no combination of lateral and vertical approach modes armed.
When pressed, arms or engages both lateral and vertical approach modes.
When pressed, displays the LS deviations, if the LS pb of the EFIS CP is off.

L2 For more information about the approach modes, *Refer to DSC-22-FG-70-80-00 Approach Overview*.

AUDIO INDICATORS

Ident.: DSC-22-FG-90-120-00014649.0001001 / 06 AUG 14
Applicable to: ALL

L12

Audio Indicator	**Condition or Cause**	**Duration**
C Chord (Sound)	Altitude Alert. The aircraft reaches an altitude target. For more information about altitude alert, *Refer to DSC-31-CDS-40-20-60 Altitude Alerts*.	Sounds during 1.5 s.
	Altitude Alert. The aircraft deviates from an altitude target. For more information about altitude alert, *Refer to DSC-31-CDS-40-20-60 Altitude Alerts*.	Sounds as long as the aircraft deviates from the target altitude, unless the flight crew presses the MASTER WARN.
Cavalry Charge (Low Volume Sound)	Voluntary AP disconnection. The flight crew pressed the sidestick pb one time. For more information about AP disconnection, *Refer to DSC-22-FG-40-30 Disengagement Annunciations and Warnings*. May be associated with the AUTO FLT AP OFF ECAM alert (*Refer to procedure*).	Sounds as long as the AP is disconnected, untill the flight crew presses: - The MASTER WARN. - The sidestick pb a second time. Stops automatically after 0.8 s, then sounds again at high volume after 1.8 s.

Continued on the following page

Continued from the previous page

Audio Indicator	**Condition or Cause**	**Duration**
Cavalry Charge (High Volume Sound)	Not-voluntary AP disconnection. AP disconnection due to: - A failure, or - Pedal movements, or - Sidestick deflection. Associated with the AUTO FLT AP OFF ECAM alert (*Refer to procedure*).	Sounds as long as the AP is disconnected, until the flight crew presses: - The MASTER WARN. - The sidestick pb a second time.
Triple Click (Sound)	Flight guidance reversion. The flight guidance detects a reversion if: - The approach and landing capability downgrades, or - There is an automatic reversion of the AP/FD mode, or - There is an automatic reversion of the A/THR mode, or - The flight guidance cannot maintain the VS/FPA target.	Sounds one time.

AUTOLAND LIGHT

Ident.: DSC-22-FG-90-100-00003713.0001001 / 07 NOV 16
Applicable to: ALL

L12

The AUTOLAND light flashes, when the aircraft is in autoland below 200 ft RA, and the required conditions to perform an autoland are no longer applicable.
For more information on the flashing of the AUTOLAND light, *Refer to DSC-22-FG-100-20 Autoland Warning*.

Intentionally left blank

The Captain's (First Officer's) PFD displays the Velocity Vector (VV).
When pressed, removes the Velocity Vector on the PFD.
For more information about FPV or VV display on PFD, *Refer to DSC-31-CDS-40-20-30 Flight Path Vector or Velocity Vector*.

Note: *When TRK-FPA is selected, the Velocity Vector (VV) is not displayed. Both PFDs continue to display the FPV, but the VV light remains on.*

The Captain's (First Officer's) PFD does not display the Velecity Vector (VV).
When pressed, display the VV on the PFD except if TRK-FPA is selected.
When TRK-FPA is selected, both PFDs automatically display the Flight Path Vector (FPV).

The PFDs no longer display the FPV(VV), when:

- The flight crew changes from TRK-FPA to HDG-V/S
  For more information on HDG-V/S / TRK-FPA selection, *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection*.
- The flight crew performs a go-around.

Ident.: DSC-22-FG-90-30-G10-00003742.0001001 / 06 AUG 14

L12

The Captain's (First Officer's) PFD displays the following landing system data in accordance with the approach selected on the FMS ARRIVAL page: Deviation scales, deviation signals, course pointer, information.
For information on the landing system data, *Refer to DSC-31-CDS-40-20-110 Departure and Approach Guidance*.
If the flight crew selected an approach on the FMS ARRIVAL page, and the FMS flight phase is descent or approach, the FMA displays the landing capability.
For more information about landing capability display, *Refer to DSC-22-FG-80 Display*.

Note: *1. If the direct distance to the destination airport is more than 300 NM, only the deviation scales appear.*
2. The LS light automatically comes on when LOC, LOC B/C or F-LOC arms.

The Captain's (First Officer's) PFD does not display the landing system data.

FMA

Applicable to: ALL

Ident.: DSC-22-FG-90-80-F-00003700.0001001 / 06 AUG 14

The Flight Mode Annunciator (FMA) is located on the upper part of the PFD. The FMA displays the following information that are associated to flight guidance:
- The A/THR messages and modes
- The AP/FD modes
- The approach and landing capability
- The AP, FD, and A/THR engagement status
- The flight guidance messages.

For more information about all FMA indications, *Refer to DSC-31-CDS-40-20-120 Flight Mode Annunciator (FMA)*.

A white box appears for 10 s around the annunciation of:
- An A/THR mode engagement
- An AP/FD mode engagement
- The approach and landing capability (or the change of the approach and landing capability)
- An AP, FD, or A/THR engagement status change.

A/THR MESSAGES AND MODES (COLUMN 1)

FIRST AND SECOND LINES

Display	Meaning	For display conditions:
MAN TOGA	The A/THR is armed, and the engines apply maximum thrust.	*Refer to DSC-22-FG-50-30 FMA Display*.
MAN FLX +45	The A/THR is armed, and the engines apply flexible thrust, with FLEX temperature set to 45 °.	
MAN GA SOFT	The A/THR is armed and the engines apply: - The thrust to target the vertical speed of approximately 2 000 ft/min, or - The maximum thrust (TOGA) if the 2 000 ft/min target cannot be reached.	
MAN DTO	The A/THR is armed, and the engines apply derated thrust.	
MAN MCT	The A/THR is armed, and the engines apply maximum continuous thrust.	
MAN THR	The A/THR is armed, and the engines apply a thrust defined by the thrust lever positions.	

These messages appear with a permanent white box, except MAN THR that appears in an amber box.

FIRST AND SECOND LINES

Display	Meaning	For display conditions:
THR CLB	The A/THR is active, and both engines apply climb thrust.	*Refer to DSC-22-FG-50-50 THRUST Mode Operation*.
THR DCLB*	The A/THR is active, and the thrust goes toward derated climb thrust.	
THR DCLB	The A/THR is active, and the engines apply the derated climb thrust.	
NOISE N1 82%	The A/THR is active, and the engines apply noise thrust, with 82% N1 target.	
THR CLB*	The A/THR is active, and the engines apply a thrust that converges toward climb thrust.	
THR DES	The A/THR is active, and the engines apply a thrust slightly highest than idle thrust.	
THR IDLE	The A/THR is active, and the engines apply a minimum and limited mode thrust.	
THR MCT	The A/THR is active, and the operative engines apply maximum continuous thrust.	
THR LVR	The A/THR is active, and the engines apply a thrust defined by the thrust level positions.	

Continued on the following page

Continued from the previous page

Display	Meaning	For display conditions:
SPEED or MACH	The A/THR is active, and controls a speed target, or a Mach target.	*Refer to DSC-22-FG-50-50 SPEED/MACH Mode*.
A.FLOOR with a flashing amber box	The A/THR is active, and the engines apply maximum thrust. *Note:* *The α-floor conditions are applicable.*	*Refer to DSC-22-FG-50-50 ALPHA FLOOR*.

THIRD LINE

L13

Display	Meaning	For display conditions:
LVR ASYM	The A/THR is armed or active, and one thrust lever is at the CL or FLX-MCT detent, and the other one is not on the same position. *Note:* *All the engines are operative.*	*Refer to DSC-22-FG-50-30 Effect of thrust lever movement when the A/THR is active*.
THR LK flashing	The thrust is frozen after an A/THR involuntary disconnection.	*Refer to DSC-22-FG-50-40 THRUST LOCK Function*.
LVR CLB flashing	Requests to set the thrust levers to the CL detent when both engines are running.	The A/THR is armed, and the aircraft reaches the thrust reduction altitude. *Refer to DSC-22-FG-50-30 Effect of thrust lever movement when the A/THR is active*.

Continued on the following page

Continued from the previous page

Display	**Meaning**	**For display conditions:**
LVR MCT flashing	If one engine is out, requests to set the thrust lever of the operative engine to the FLX-MCT detent.	The A/THR is armed, with one engine inoperative and one of the following conditions occurs: - The thrust lever of the operative engine is set at the TOGA detent, and the aircraft reaches the thrust reduction altitude, *Refer to DSC-22-FG-50-30 Effect of thrust lever movement when the A/THR is active*. - The thrust lever of the operative engine is below the FLX-MCT detent. The message is inhibited as long as the CAS is above VMAX.
LVR TOGA flashing	If one engine is out during a soft go-around, requests to set the thrust lever of the operative engine to the TOGA detent.	- During takeoff, the flight crew sets at least one thrust lever to the FLX-MCT detent and neither FLX nor DERATED is selected in the T.O PERF page of FMS. - During a soft go-around one engine fails and the aircraft is below the thrust reduction altitude. The message is inhibited as long as the CAS is above VMAX.

Ident.: DSC-22-FG-90-80-F-00003702.0001001 / 08 JUL 19

AFS MESSAGES (LINE 3)

FIRST AND SECOND COLUMNS

Display	Meaning	For more information:
SPD SEL 220	The flight crew preselected 220 kt on the CLB or CRZ panel of the FMS PERF page. *Note: The selected speed target is taken into account, when the next FMS flight phase engages (climb, or cruise).*	*Refer to DSC-22-FMS-20-20-20 PERF Page*.
MACH SEL 0.82	The flight crew preselected M 0.82 on the CRZ panel of the FMS PERF page. *Note: The selected Mach target is taken into account, when the cruise flight phase engages.*	

SECOND AND THIRD COLUMNS

Display	Meaning	Display Conditions
TCAS RA INHIBITED	The AP/FD TCAS mode is disengaged because the TA ONLY or the STDBY mode of the TCAS is selected.	*Refer to DSC-22-FG-70-100-50 Inhibition conditions*.
TRK FPA DESELECTED	The flight reference TRK-FPA changed to HDG-V/S following AP/FD TCAS mode engagement.	Appears when the aircraft is clear of conflict, *Refer to DSC-22-FG-70-100-40 Consequence on AP/FD Vertical Mode*.
FCU ALT ABOVE A/C (Remains 10 s then disappears.)	The aircraft descends below the altitude set on the AFS CP.	The vertical mode of guidance is VS, or FPA with a descent profile, and the altitude set on the AFS CP is above the current aircraft altitude.
FCU ALT BELOW A/C	The aircraft climbs above the altitude set on the AFS CP.	The vertical mode of guidance is VS, or FPA with a climb profile, and the altitude set on the AFS CP is below the current aircraft altitude.
DISCONNECT AP FOR LDG (pulses 9 s, and then remains steady)	The flight crew must disconnect the AP for landing.	The aircraft reaches 150 ft Radio Altimeter when: - One AP is engaged - The approach and landing capability on the FMA is: • APPR1, F-APP, F-APP + RAW, RAW ONLY. • Not displayed and the vertical guidance mode is APP DES, OP DES, DES, FPA, or V/S. The message disappears, when the flight crew disengages the AP.

Continued on the following page

Continued from the previous page

Display	Meaning	Display Conditions
AP IN PROT	The flight guidance is not able to maintain the current AP guidance.	This message appears only when the AP is engaged and the protection occurs.
FOR GA : SET TOGA (pulses 9 s, and then remains steady)	The flight crew must set the thrust levers to the TOGA detent to perform a go-around	The flight crew sets the thrust levers to the MCT/FLX detent during approach, and: - The aircraft is below 1 000 ft RA - The slats/flaps configuration based on the real position or on the FLAPS lever position) is different from the clean configuration - The AP and/or the FD are engaged.

L2 *Note: All FMA messages are displayed in green on the HUD, but the location of some messages may be slightly different between HUD and PFD.*

AP/FD VERTICAL MODES (COLUMN 2)

FIRST LINE

L12

Display	Meaning	For display conditions:
SRS	The speed reference system mode is engaged during takeoff or go-around.	*Refer to DSC-22-FG-70-20-30 Engagement Conditions*, and *Refer to DSC-22-FG-70-90-20 Engagement Conditions*.
OP CLB	The Open Climb mode is engaged.	*Refer to DSC-22-FG-70-40-20 Engagement Conditions*.
CLB	The Climb mode is engaged.	*Refer to DSC-22-FG-70-40-30 Engagement Conditions*.
ALT*	The altitude capture mode is engaged, and acquires the AFS CP selected altitude.	*Refer to DSC-22-FG-70-50-20 Engagement Conditions*.
ALT CST*	The altitude capture mode is engaged, and acquires an altitude constraint.	
ALT CRZ*	The altitude capture mode is engaged, and acquires the cruise altitude.	
ALT	The altitude hold mode is engaged, and holds the AFS CP selected altitude.	*Refer to DSC-22-FG-70-50-30 Engagement Conditions*.
ALT CST	The altitude hold mode is engaged, and holds an altitude constraint.	
ALT CRZ	The altitude hold mode is engaged, and holds the cruise altitude.	
OP DES	The Open Descent mode is engaged.	*Refer to DSC-22-FG-70-60-20 Engagement Conditions*.

Continued on the following page

Continued from the previous page

Display	Meaning	For display conditions:
EMER DES	The Emergency Descent mode is engaged.	*Refer to DSC-22-FG-70-60-40 Engagement Conditions.*
DES	The Descent mode is engaged.	*Refer to DSC-22-FG-70-60-30 Engagement Conditions.*
V/S ±XXXX	The Vertical Speed mode is engaged to acquire and hold the V/S selected on the AFS CP. Note: *If the V/S target is not held when the AP is engaged:* - *A triple click audio indicator sounds* - *An amber box around the message flashes* - *The V/S target pulses.* *This occurs, when the V/S is 500 ft/min below (above) the V/S target in climb (descent).*	*Refer to DSC-22-FG-70-70 Engagement Conditions.*
FPA ±X.X°	The Flight Path Angle mode is engaged to acquire and hold the FPA selected on the AFS CP. Note: *If the FPA target is not held when the AP is engaged:* - *A triple click audio indicator sounds* - *An amber box around the message flashes* - *The FPA target pulses.* *This occurs, when the V/S is 500 ft/min below (above) the V/S/FPA target in climb (descent).*	
G/S*	The Glide Slope capture mode engages.	*Refer to DSC-22-FG-70-80-30 Engagement Conditions.*
G/S	The Glide Slope track mode is engaged.	*Refer to DSC-22-FG-70-80-40 Engagement Conditions.*
F-G/S*	The FLS Glide Slope capture mode engages.	*Refer to DSC-22-FG-70-80-100 Engagement Conditions.*
F-G/S	The FLS Glide Slope track mode is engaged.	*Refer to DSC-22-FG-70-80-110 Engagement Conditions.*
APP-DES	The continuous descent mode is engaged.	*Refer to DSC-22-FG-70-80-140 General.*
TCAS	The AP/FD TCAS mode is engaged.	*Refer to DSC-22-FG-70-100-30 Engagement Conditions.*

MINIMUM DESCENT HEIGHT/ALTITUDE, OR DECISION HEIGHT (COLUMN 4)

THIRD LINE

Display	Meaning	For more information:
BARO XXXXX	Minimum descent height/altitude, as entered on the FMS PERF page - APPR panel.	*Refer to DSC-22-FMS-20-20-20 PERF Page*.
RADIO XXX	Decision height, as entered on the FMS PERF page - APPR panel.	
NO DH	The flight crew enters NONE, NO, NO DH or NODH on RADIO entry field of the FMS PERF page.	

L2 The minimum descent height/altitude or decision height appears, when the aircraft is in:
- FMS CRZ phase, and at less 250 NM from the destination
- FMS DES phase
- FMS APPR phase
- FMS GA phase.

Ident.: DSC-22-FG-90-80-F-00003708.0001001 / 03 DEC 15

AP, FD, AND A/THR ENGAGEMENT STATUS (COLUMN 5)

FIRST LINE

DISPLAY	MEANING	For display conditions:
AP1+2	The AP1 and AP2 are engaged.	*Refer to DSC-22-FG-40-20 Manual Engagement of both APs.*
AP1	The AP1 is engaged.	*Refer to DSC-22-FG-40-20 Manual Engagement of one AP.*
AP2	The AP2 is engaged.	

SECOND LINE

DISPLAY	MEANING	For display conditions:
1FD2	FD1 and FD2 are engaged.	*Refer to DSC-22-FG-30-30 Engagement Annunciation.*
1FD-	F/O ON BKUP is selected on the AIR DATA selector.	
-FD2	CAPT ON BKUP is selected on the AIR DATA selector.	

THIRD LINE

DISPLAY	MEANING	For display conditions:
A/THR	The A/THR is active.	*Refer to DSC-22-FG-50-30 Arming Conditions.*
A/THR	The A/THR is armed.	*Refer to DSC-22-FG-50-30 Activation Conditions.*

Intentionally left blank

MEMO

Applicable to: ALL

Ident.: DSC-22-FG-90-110-GMEMO-00003714.0001001 / 06 AUG 14

AP OFF	Both APs disengage, after the flight crew presses the sidestick pb. Appears on the PFDs, and on the WD. For information on AP disengagement annunciations and warnings, *Refer to DSC-22-FG-40-30 Disengagement Annunciations and Warnings*.

Ident.: DSC-22-FG-90-110-GMEMO-00003715.0001001 / 04 MAY 16

A/THR OFF	The A/THR is voluntary disconnected: - The flight crew pressed one A/THR instinctive disconnect pushbutton, or - The flight crew sets the thrust levers at the idle or reverse detent when the altitude is above 50 ft RA. Appears on the PFDs, and on the WD. For more information, *Refer to DSC-22-FG-50-40 Introduction*.

Intentionally left blank

SHARED MESSAGE AREA

The shared message area displays messages in order to inform the flight crew about an event that is related to the FMS or ATC communication.
The shared message area displays the following messages:

D-ATIS RECEIVED	Indicates that a new ATIS report is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS GROUND MSG	Indicates that an ATIS FSM message is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS NO REPLY	Appears when the time-out (7.5 min) is reached and that no ATIS was received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.

D-ATIS SEND FAIL	Appears when an ATIS request failed for one of the following reasons: - The sending of the ATIS request failed, or - The time-out (6 min) for acknowledgement is reached, or - A negative answer for the ATIS request is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
CHECK FMS MESSAGE	Indicates that the FMS triggered an amber FMS message. Only appears if the MFD displays a page that is not an FMS page. Disappears when the flight crew accesses an FMS page.
L12 IND	Indicates that both FMS operate in INDEPENDENT mode. For information about the INDEPENDENT mode, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.

L2 *Note:* *The shared message area displays only one message at a time. However, the IND message can appear in addition to another message.*

Ident.: DSC-22-FG-90-50-G10-00011331.0001001 / 04 DEC 14

FLIGHT NUMBER

Indicates the flight number that the flight crew has entered on the ACTIVE/INIT page of the FMS (*Refer to DSC-22-FMS-20-20-20 INIT Page*).

Ident.: DSC-22-FG-90-50-G10-00011329.0001001 / 06 AUG 14

GENERAL MENU BAR

The general menu bar provides the flight crew with access to the FCU BKUP pages.
The FCU BKUP pages are divided into 2 groups, indicated by 2 menus on the general menu bar: AFS CP, EFIS CP.

Note: *A box around the menu name indicates that the displayed page belongs to this menu.*

FCU BKUP PAGE HEADER

The FCU BKUP page header indicates the title of the FCU BKUP page currently displayed:

- AFS CONTROL PAGE, or
- EFIS CONTROL PAGE.

MFD - FCU BKUP PAGES

Ident.: DSC-22-FG-90-50-00011333.0001001 / 06 AUG 14
Applicable to: ALL

FCU BKUP PAGES

The AFS CP page and the EFIS CP page work as the AFS CP and the EFIS CP. The AFS CP page and the EFIS CP page recover most of the EFIS CP and AFS CP controls and indicators. However, on the EFIS CP page, the display of the airport navigation function, and the video of the external and taxiing aid camera system are not available.
The flight crew performs the selections on the FCU backup via the KCCU.

MFD - AFS CONTROL PAGE

Applicable to: ALL

Ident.: DSC-22-FG-90-50-G20-00002696.0001001 / 06 AUG 14

The AFS CONTROL PANEL page is operative, only when the AFS CP is not operative.

L2 Nevertheless, the flight crew can access to the AFS CONTROL PANEL page of the FCU BKUP even if the AFS CP is operative. The speed/Mach, heading/track, altitude, and vertical speed/flight path angle targets are continuously updated in accordance with changes on the AFS CP.

L1 On the AFS CONTROL PANEL page, the flight crew uses the KCCU wheel to set the targets: Speed/Mach, heading/track, altitude, and vertical speed/flight path angle. For these selections, the numeric keys of the keyboard are not available.

A selection on the Captain (First Officer) AFS CP page is automatically updated on the First Officer (Captain) AFS CP page.

L3 When LAND is engaged, the flight crew can no longer use the AFS CONTROL PANEL page, and all controls are not available (except the FD button).

PURPOSE

The AFS CONTROL PANEL page can be used as a backup of the AFS CP, when the AFS CP is failed.

Ident.: DSC-22-FG-90-50-G20-00013264.0001001 / 06 AUG 14

ACCESS

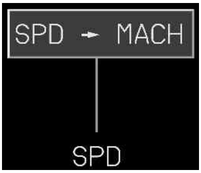
The flight crew can access the AFS CONTROL PANEL page by selecting the AFS CP panel via the FCU BKUP menu of the MFD.

Ident.: DSC-22-FG-90-50-G20-00011569.0001001 / 06 AUG 14

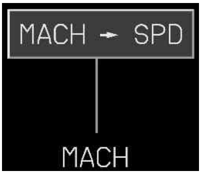
SPEED/MACH

SPD/MACH BUTTON

This button has the same functionality than the MACH/SPD pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 SPD/MACH pb*.

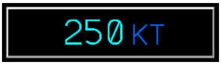


The selected speed target is in Knots.
When clicked, the speed reference changes to Mach.

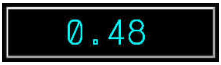


The selected speed target is in Mach.
When clicked, the speed reference changes to Knots.

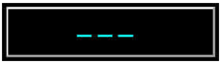
SPD/MACH WINDOW



Displays the speed target, when the speed in Knots is in selected mode.



Displays the speed target, when the speed in Mach is in selected mode.



The speed is in managed mode.

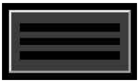
SELECTED/MANAGED BUTTONS

When clicked, activates the selected speed or Mach target.

When clicked, the speed or Mach becomes managed.

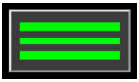
Ident.: DSC-22-FG-90-50-G20-00011348.0001001 / 06 AUG 14

AFS CP BACKUP BUTTON



The AFS backup function is not active.
This is the default status.

L12



The AFS backup function is active.

- A pilot manually clicked the AFS CP BACKUP button to on, or
- A pilot manually pressed the FCU sw (D6) on the left CKPT EQPT POWER SUPPLY, or
- The AFS CP is failed.
  Associated with the AUTO FLT AFS CTL PNL FAULT alert.

When the AFS backup function is active:

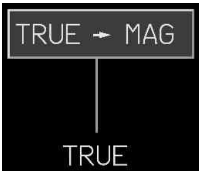
- The last valid selections and values of the AFS CP are recovered
- The AFS CP is not available, and the display on the AFS CP is blank.

Ident.: DSC-22-FG-90-50-G20-00011347.0001001 / 06 AUG 14

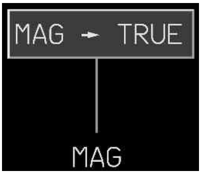
LATERAL

TRUE/MAG BUTTON

This button has the same functionality than the TRUE/MAG pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 TRUE/MAG pb*.



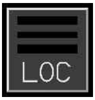
When clicked, changes the true (TRUE) north reference to magnetic (MAG) north reference .



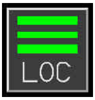
When clicked, changes the magnetic (MAG) north reference to true (TRUE) north reference .

LOC BUTTON

This button has the same functionality than the LOC pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 LOC pb*.



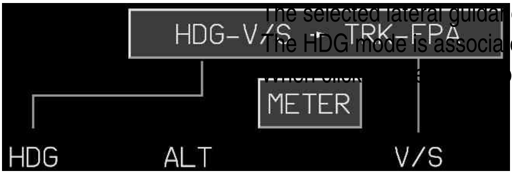
No approach mode is armed.
When clicked, arms an approach mode.



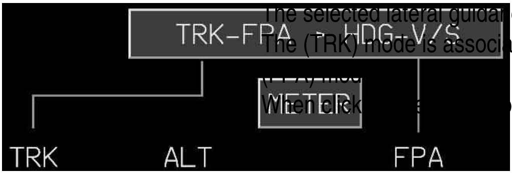
Arms a lateral mode for approach (LOC, F-LOC, LOC B/C)
When clicked, disarms or disengages the LOC, LOC B/C, or F-LOC mode.

HDG-V/S / TRK-FPA BUTTON

This button has the same functionality than the HDG-V/S / TRK-FPA pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 HDG/TRK Knob*.

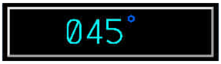


The selected lateral guidance is in heading (HDG) mode.
The HDG mode is associated with the Vertical Speed (V/S) mode.
de changes to the TRK mode.

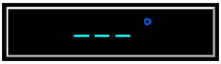


The selected lateral guidance is in track (TRK) mode.
The (TRK) mode is associated with the vertical Flight Path Angle
When click de changes to the TRK mode.

HDG / TRK WINDOW



A HDG, or TRK target is selected.



The lateral guidance is managed.

SELECTED / MANAGED BUTTONS

When clicked, activates the selected heading or track target.

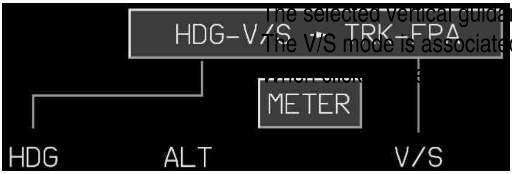
When clicked, a managed lateral mode arms or engages.

Ident.: DSC-22-FG-90-50-G20-00011568.0001001 / 06 AUG 14

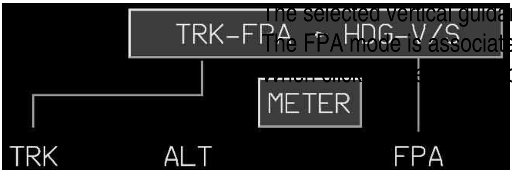
VERTICAL

HDG-V/S / TRK-FPA BUTTON

This button has the same functionality than the HDG-V/S / TRK-FPA pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 HDG-V/S / TRK-FPA pb*.



The selected vertical guidance is in Vertical Speed (V/S) mode.
The V/S mode is associated with the HDG lateral mode.
When click [illegible] e [illegible] e changes to the FPA mode.



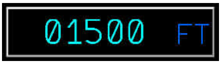
The selected vertical guidance is in Flight Path Angle (FPA) mode.
The FPA mode is associated with the TRK lateral mode.
When click [illegible] e [illegible] de changes to the V/S mode.

METER BUTTON

This button has the same functionality than the METER pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 METER pb*.

When clicked, displays the current and target altitudes in meters (in addition to feet) on the PFDs.
When clicked, clears the meter display from the PFDs.

ALT WINDOW



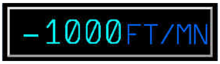
Displays the altitude target set by the flight crew.

ALT OPEN/MANAGED BUTTONS

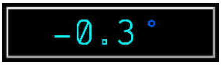
When clicked, the vertical guidance is engaged in an ALT selected mode (OP CLB, or OP DES).
The FMS vertical profile is disregarded.

When clicked, the vertical mode is managed.
The FMS vertical profile is respected, or the altitude target set in the ALT window is respected, if applicable

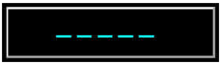
V/S / FPA WINDOW



Displays the V/S target, when applicable.



Displays the FPA target, when applicable.



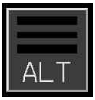
The vertical guidance is in managed mode.

V/S SELECTED BUTTON

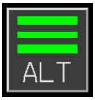
When clicked, the vertical guidance is in V/S or FPA mode.

ALT BUTTON

This button has the same functionality than the ALT pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 ALT pb*.



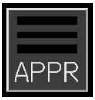
There is no guidance to maintain an altitude.
When clicked, the aircraft immediately starts to level-off.



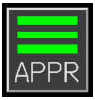
The aircraft maintains a target altitude either in managed or selected mode.
When clicked, has no effect.

APPR BUTTON

This button has the same functionality than the APPR pb on the AFS CP.
For more information, *Refer to DSC-22-FG-90-20 APPR pb*.



No approach mode is armed.
When clicked, arms an approach mode.



The approach mode is armed, or engaged.

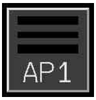
When clicked:
- Disarms or disengages the vertical mode, if the vertical mode is armed or engaged.
- Disengages the approach mode, if only the lateral approach mode is armed or engaged.

Ident.: DSC-22-FG-90-50-G20-00011570.0001001 / 06 AUG 14

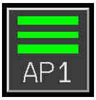
AP, FD, AND A/THR

AP 1(2) BUTTON

These buttons have the same functionality than the AP 1(2) pb on the AFS CP. For more information, *Refer to DSC-22-FG-90-20 AP1(2) pb*.



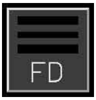
The AP1(2) is not engaged.
When clicked, engages the associated AP.



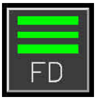
The AP1(2) is engaged.
When clicked, disengages the associated AP.

FD BUTTON

This button has the same functionality than the FD pb on the AFS CP. For more information, *Refer to DSC-22-FG-90-20 FD pb*.



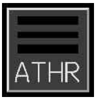
The FDs are not engaged
When clicked, engages the FDs.



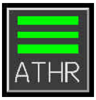
The FDs are engaged.
When clicked, disengages the FDs.

A/THR

This button has the same functionality than the A/THR pb on the AFS CP. For more information, *Refer to DSC-22-FG-90-20 A/THR pb*.



The A/THR is disconnected.
When clicked, arms or activates the A/THR.



The A/THR is armed or active.
When clicked, disconnects the A/THR.

MFD - FCU BKUP MESSAGE AREA

Ident.: DSC-22-FG-90-50-00011344.0001001 / 04 DEC 14
Applicable to: ALL

The FCU BKUP message area displays FCU BKUP messages.
The flight crew can clear the displayed message by clicking on the CLEAR INFO button, or by pressing the CLR INFO key on the KCCU.

ENTRY OUT OF RANGE MESSAGE

If the flight crew enters a value that is not in the correct range, the message area displays:

- The ENTRY OUT OF RANGE message on the first line
- The applicable range on the second line (as indicated in the table below).

Data Type	Out Of Range Messages
Barometric Reference	■ **If the selected barometric reference unit is Hectopascal:** RANGE: 745 TO 1100 HPA ■ **If the selected barometric reference is Inches of mercury:** RANGE: 22.00 TO 32.48 INHG

FORMAT ERROR MESSAGE

If the flight crew enters a barometric reference value that is not in valid, the message area displays:

- The FORMAT ERROR message on the first line
- The applicable format on the second line (as indicated in the table below).

Data Type	Data Format Help Messages
Barometric Reference	■ **If the selected barometric reference unit is Hectopascal:** FORMAT: _XXX ■ **If the selected barometric reference is Inches of mercury:** FORMAT: XX___

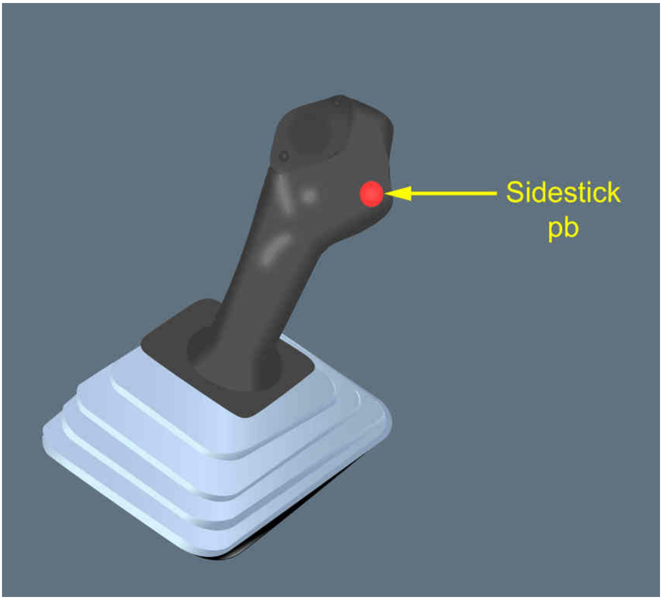
For AUTO EMER DESCENT messages on HUD, *Refer to DSC-31-CDS-50-30-140 AUTO EMER DESCENT Messages*.

Intentionally left blank

SIDESTICK

Ident.: DSC-22-FG-90-60-00003744.0001001 / 06 AUG 14
Applicable to: ALL



Sidestick

When at least one AP is engaged, the sidesticks are locked in the neutral position.
The flight crew presses the sidestick pb to disengage all AP(s) engaged.
All AP(s) engaged will also disengage, if the flight crew applies a force above a given threshold on the sidestick.
For more information on AP manual disengagement, *Refer to DSC-22-FG-40-30 Manual Disengagement*.
For information on AP disconnection annunciations and warnings, *Refer to DSC-22-FG-40-30 Disengagement Annunciations and Warnings*.
When no AP is engaged, the sidesticks are not locked.

Intentionally left blank

A/THR Instinctive Disconnect pb
Thrust Levers

Thrust Levers

A/THR INSTINCTIVE DISCONNECT PUSHBUTTON

Pressing on one A/THR instinctive disconnect pushbutton disconnects the A/THR.

L13

CAUTION	If the flight crew presses, and holds one A/THR instinctive disconnect pushbutton for more than 15 seconds, the A/THR will be disconnected for the remainder of the flight. All A/THR modes, including A.FLOOR will be lost. The A/THR will be recovered at the next aircraft power-up. The A/THR will be recovered, when one of the following occurs: - Five seconds after all engines shutdown - After power-up of all PRIMs and all FADECs.

L2 On ground, if the flight crew presses on one A/THR instinctive disconnect pushbutton when the AUTO BRK or BTV mode is armed (active), the AUTO BRK or BTV mode disarms (deactivates).

L1 THRUST LEVERS

The flight crew uses the thrust levers to:

- Arm, activate or disconnect the A/THR
  For information on A/THR arming, *Refer to DSC-22-FG-50-30 Introduction*.
  For information on A/THR activation, *Refer to DSC-22-FG-50-30 Introduction*.
- Control the thrust, when the A/THR is disconnected.
  For information on manual thrust control, *Refer to DSC-70-10-30-30 Thrust Control in Manual Mode*.

For information on standard and non-standard A/THR disconnection, *Refer to DSC-22-FG-50-40 A/THR Disconnection*.

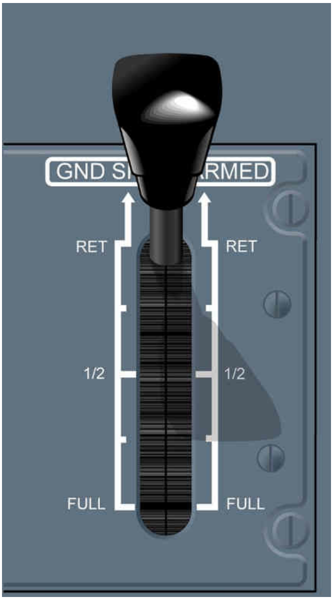
SPEED BRAKE LEVER

Speed Brake Lever



The speed brake lever is used to manually engage the EMER DES mode.

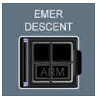
L2 For more information on the EMER DES engagement, *Refer to DSC-22-FG-70-60-40 Engagement Conditions*.

For more information, *Refer to DSC-27-10-20 SPEED BRAKE lever*.

Ident.: DSC-22-FG-90-130-A-00023926.0002001 / 30 JUN 17

EMER DESCENT PB

The Emer Descent pb is a guarded pushbutton.



The AUTO EMER DESCENT function is not armed.

EMER
DESCENT
ARM

The ARM light:

- Comes on steady when the AUTO EMER DESCENT function is manually armed. When pressed one time the AUTO EMER DESCENT function is disarmed.
- Flashes when the AUTO EMER DESCENT function is automatically armed. When pressed two times, the AUTO EMER DESCENT function is disarmed.

For more information, *Refer to DSC-22-FG-70-60-40 Arming Conditions*.

Intentionally left blank

AFS CP BACKUP FUNCTION

Ident.: DSC-22-FG-100-10-00011556.0001001 / 06 AUG 14
Applicable to: ALL

In abnormal conditions, the flight crew can set the FD and the autopilot via the AFS CONTROL PANEL page of the FCU BKUP on the MFD.
When the AFS CONTROL PANEL page becomes active, the page displays the last crew selections and the AFS CP is blank.

L2 If the flight crew recovers the AFS CP following the activation of the AFS CONTROL PANEL page, the AFS CP recovers most of the settings of the AFS CONTROL PANEL page.

L1 For more information about the AFS CONTROL PANEL page, *Refer to DSC-22-FG-90-50 MFD Overview*.

AUTOMATIC ACTIVATION OF THE AFS CONTROL PANEL PAGE

If the AFS CP fails:
- The AUTO FLT AFS CTL PNL FAULT alert triggers
- The AFS CP backup function automatically activates.

MANUAL ACTIVATION OF THE AFS CONTROL PANEL PAGE

If the flight crew detects a failure on the AFS CP, the flight crew can activate the AFS CP backup function via:
- The AFS CP BACKUP button on the AFS CONTROL PANEL page
- The FCU power supply button (D6) on the left CKPT EQPT POWER SUPPLY.
  For more information about FCU system reset, *Refer to PRO-ABN-ABN-RESET AUTO FLT FCU Reset*.

L3 AFS CP DEGRADED MODE

In normal operation, the PRIM displays on the PFD the targets that pilots set via the AFS CP or the AFS CONTROL PANEL page.

In the case of all PRIMs failure, the FCU BKUP function has an additional function that enables the display on the PFD of the following parameters that the pilots targets:
- The speed
- The heading/track
- The Altitude.

In addition, the following selections remain operative
- The MACH / SPD selection
- The HDG-V/S / TRK-FPA selection
- The MAG / TRUE selection.

Intentionally left blank

FAILURE INDICATIONS DURING APPROACH

Applicable to: ALL

Ident.: DSC-22-FG-100-20-GWAR-00006063.0001001 / 07 NOV 16

AUTOLAND WARNING

L123

The AUTOLAND light flashes, when the aircraft is in autoland below 200 ft RA, and the required conditions to perform an autoland are no longer applicable.

The autoland light flashes when the LAND mode is engaged below 200 ft RA, and one of the following occurs:

- The last AP disengages,

  The AUTO LAND light stops flashing, when:
  - The flight crew engages the go-around, or
  - The altitude goes above 200 ft RA, or
  - The flight crew cancels the AUTO FLT AP OFF alert (if the alert was triggered).

  Note: *If the flight crew quickly presses on the sidestick pushbutton two times, the AUTOLAND light appears furtively.*

- Between 200 ft and 100 ft RA, if the approach and landing capability is LAND2(3) during an ILS approach, or LAND1 during a GLS ◁ approach:
  - The glide signal of the ILS transmitter fails, or the glide deviation is not available, or
  - The glide deviation is excessive.
    The glide deviation becomes excessive, when the glide deviation is one gradation away from the center of the scale.

  The AUTO LAND light stops flashing, when:
  - LAND disengages, or
  - The flight crew presses the sidestick pushbutton two times to disengage the AP(s).
- Between 200 ft and 15 ft RA, if the approach and landing capability is LAND2(3) during an ILS approach, or LAND1 during a GLS ◁ approach:
  - The LOC signal of the ILS transmitter fails, or the LOC deviation is not available, or
  - The LOC deviation is excessive.

The LOC deviation becomes excessive, when the LOC deviation is one quarter gradation away from the center of the scale.

The AUTO LAND light stops flashing, when:

- LAND or FLARE disengages, or
- The flight crew presses the sidestick pushbutton two times to disengage the AP(s).

- One radio altimeter is failed, and the values provided by the two remaining radio altimeters differ by more than 15 ft

  The AUTO LAND light stops flashing, when:

  - LAND, FLARE or ROLL OUT disengages, or
  - The flight crew presses the sidestick pushbutton two times to disengage the AP(s).

- A long flare is detected
  A long flare is detected, when FLARE is engaged while the aircraft flies more than 1 000 m.

  The AUTO LAND light stops flashing, when:

  - The flight crew engages the go-around, or
  - The flight crew presses the sidestick pushbutton two times to disengage the AP(s).

- A failure of the thrust control
- The alpha floor condition occurs.

Ident.: DSC-22-FG-100-20-GWAR-00006064.0001001 / 06 AUG 14

EXCESSIVE DEVIATION INDICATION

The PFD, and the ND (if the ND is in ROSE-LS mode) provides crew awareness in case of excessive deviation during an LS approach.

L2 The excessive deviation indication appears only when all the following conditions are applicable:

- The aircraft is below 1 000 ft
- The guidance mode is engaged in LOC, LAND, or FLARE
- The approach and landing capability is LAND 1, LAND 2 or LAND 3

L1 In the case of excessive deviation, the following indications appear:

- The LOC scale flashes, if the LOC deviation is more than one quarter dot for more than two seconds.
  L2 This is applicable, if the aircraft is above 15 ft RA.
- L1 The G/S scale flashes, if the G/S deviation is more than one dot for more than two seconds.
  L2 This is applicable, if the aircraft is above 100 ft RA.

Ident.: DSC-22-FG-100-20-GWAR-00006065.0001001 / 06 AUG 14

APPROACH AND LANDING CAPABILITY DOWNGRADE

The FG announces any downgrade of the approach and landing capability with:
- A triple click audio indicator
- The display of the new computed capability in a flashing white box for 10 s
- The display of the inoperative capability on the SD STATUS page.

L2 The downgrade of the approach and landing capability detected by the FG, is associated with:
- An assigned system alert (e.g. F/CTL FCDC 1 FAULT), or
- The AUTO FLT APPROACH CAPABILITY DOWNGRADED alert (*Refer to procedure*)

L1 Note: *Below 200 ft RA, the FG freezes the LAND3 DUAL capability. Therefore, a failure that occurs below 200 ft RA does not change the capability of the system, if one AP at least is engaged.*

Ident.: DSC-22-FG-100-20-GWAR-00006066.0001001 / 06 AUG 14

FAILURE OF ONE LS RECEIVER

In the case of a failure of one LS receiver, the AP/FD uses the remaining LS system.

EFFECT ON APPROACH AND LANDING CAPABILITY

The approach and landing capability downgrades to APPR1.

EFFECTS ON PFD AND ND (IN ROSE-LS MODE)

When the flight crew displays the LS deviation on PFD, and depending on the selected approach:
- The LOC or F-LOC flag appears instead of the lateral deviation scale on the CAPT(F/O) PFD, if the receiver of the lateral deviation of the LS1(2) is failed
- The G/S or F-G/S flag appears instead of the vertical deviation scale on the affected CAPT(F/O) PFD, if the receiver of the vertical deviation of the LS1(2) is failed.

Ident.: DSC-22-FG-100-20-GWAR-00006068.0001001 / 02 OCT 14

FAILURE OF THE LS TRANSMITTER

EFFECTS ON BOTH PFD AND ND (IN ROSE-LS MODE)

If the LOC transmitter fails:
- The LOC indexes disappear on both PFDs
- The LOC scales temporarily flash on both PFDs.

L2 The detection of the LOC transmitter failure is available between 1 000 ft and 15 ft, when the LOC mode is engaged.

L1 If the G/S transmitter fails:
- The G/S indexes disappear on both PFDs
- The G/S scales temporarily flash on both PFDs.

L2 The detection of the G/S transmitter failure is available between 1 000 ft and 100 ft, when the G/S, LAND or FLARE mode is engaged.

L1 EFFECTS ON AP AND FD s

If an approach mode is engaged (LOC*, LOC, LOC B/C*, LOC B/C, LAND, FLARE), when the LS transmitter failure occurs, the FD bars flash for 7 s on both FDs.
During 7 s the LS deviation (LOC and G/S) is set to zero.
If the failure remains after 7 s, the AP(s) disengages and the FD reverts the HDG/TRACK and V/S / FPA modes.
The FD bars stop flashing, after the reversion.

Note: If the failure occurs below 200 ft RA, the AP/FD remain engaged with the current modes.

EFFECT ON THE AUTOLAND LIGHTS

In the case of a LS transmitter failure below 200 ft, the AUTOLAND lights comes on.
For more information about the AUTOLAND lights, *Refer to DSC-22-FG-100-20 Autoland Warning*.

Ident.: DSC-22-FG-100-20-GWAR-00006069.0001001 / 02 OCT 14

FMS FAILURE

FAILURE OF ONE FMS

In the case of one FMS1(2) failure during the approach the AP uses the available FMS until the backup FMC-C takes over.
For more information about one FMS failure, *Refer to DSC-22-FMS-40 Failure of One FMC*.

FAILURE OF TWO FMS

If three FMCs are failed, or both FMS1 and 2 fail at the same time the FMS guidance is no longer available. However, the AP/FD remains engaged but the guidance mode reverts to HDG/TRACK and V/S / FPA.

Note: In case of both FMS failure during a RNP approach with APP DES engaged, the AP/FD does not disengage as long as the backup trajectory is available.

For more information about FMC failure, *Refer to DSC-22-FMS-40 Failure of Two FMCs (SINGLE Mode)*.

For more information about three FMC failure, *Refer to DSC-22-FMS-40 Failure of All FMCs (Backup Navigation)*.

Intentionally left blank

HOW TO DEFINE A HDG/TRK PRESET

Applicable to: ALL

Ident.: DSC-22-FG-110-GHOW-00006097.0001001 / 06 AUG 14

HOW TO DEFINE A HDG/TRK PRESET BEFORE TAKEOFF

- **Before takeoff, and up to 30 ft RA:**

  Turn the HDG/TRK knob.

  This action defines a HDG/TRK preset. NAV disarms. The preset value remains displayed on the HDG/TRK window (even when RWY TRK engages at 50 ft RA).
  When the flight crew pulls the HDG/TRK knob (at least 5 s after liftoff), HDG or TRACK engages. The aircraft follows the preset target.

Ident.: DSC-22-FG-110-GHOW-00006165.0001001 / 06 AUG 14

HOW TO DEFINE A HDG/TRK PRESET DURING APPROACH, OR GO-AROUND

- **If LOC*, LOC, F-LOC*, F-LOC, LAND, FLARE, ROLL OUT or GA TRK is engaged:**

  Turn the HDG/TRK knob.

  This action defines a HDG/TRK preset. The preset value remains displayed on the HDG/TRK window, as long as one of the above modes is engaged.
  After go-around engagement, HDG/TRACK will engage, when the flight crew pulls the HDG/TRK knob.
  L3 *This is applicable, if the flight crew pulls the HDG/TRK knob above 100 ft RA.*
  L1 *When the HDG or TRACK engages, the heading/track target is the HDG/TRK preset.*

Intentionally left blank

OVERVIEW

Applicable to: ALL

Ident.: DSC-22-FMS-10-10-10-00003172.0001001 / 14 APR 14

The Flight Management System (FMS) provides:
- Flight planning and navigation information
- Performance calculation and optimization
- Long-term guidance targets.

The FMS also has:
- An Engine-Out (EO) mode
- A takeoff surveillance function
- A time function
- A print function.

The FMS information appears on different displays.

Ident.: DSC-22-FMS-10-10-10-00003173.0001001 / 14 APR 14

FLIGHT PLANNING

The flight crew can create an entire flight plan (lateral flight plan and vertical flight plan) in the FMS.
The flight crew first selects or creates a basic flight plan, and then inserts the fuel, load, and wind information. When all of the necessary data is inserted, the FMS computes and displays the track, speed, altitude, time, wind, and fuel predictions that are associated with the flight plan.
The flight crew can modify the flight plan at any time. These modifications are referred to as revisions.
For more information about flight planning, *Refer to DSC-22-FMS-10-40-10 Introduction*.

Ident.: DSC-22-FMS-10-10-10-00003174.0001001 / 14 APR 14

NAVIGATION

The FMS tunes the radio navigation aids, provides information about the aircraft position, and defines the navigation accuracy.
For more information about the navigation functions of the FMS, *Refer to DSC-22-FMS-10-30-10 Aircraft Position*.

Ident.: DSC-22-FMS-10-10-10-00003175.0001001 / 14 APR 14

PERFORMANCE CALCULATION AND OPTIMIZATION

The FMS computes optimized performance data that is associated with each flight phase.
For more information about the performance function of the FMS, *Refer to DSC-22-FMS-10-50-10 Overview*.

Ident.: DSC-22-FMS-10-10-10-00003176.0001001 / 14 APR 14

LONG-TERM GUIDANCE TARGETS

The FMS sends targets to the Flight Guidance (FG) in order to guide the aircraft along the FMS flight plan.

L2 For more information about the FG, *Refer to DSC-22-FG-10 Introduction*.

Ident.: DSC-22-FMS-10-10-10-00016754.0001001 / 14 APR 14

ENGINE-OUT (EO) MODE

In the case of an engine failure, the Engine-Out (EO) mode of the FMS becomes active. When the EO mode is active, the FMS takes the engine failure into account for the computation of the performance data, the flight plan predictions, and the long-term guidance targets.
For more information about the EO mode of the FMS, *Refer to DSC-22-FMS-10-60 General*.

Ident.: DSC-22-FMS-10-10-10-00024962.0001001 / 03 JAN 19

TAKEOFF MONITORING FUNCTION ⋞

The Takeoff Monitoring (TOM) function monitors the acceleration of the aircraft during takeoff roll and alerts the flight crew if a significant degradation is detected.
For more information about the takeoff monitoring function of the FMS, *Refer to DSC-22-FMS-10-70-10 Takeoff Monitoring (TOM) Function (If Installed)*.

Ident.: DSC-22-FMS-10-10-10-00016756.0001001 / 05 JUL 16

TAKEOFF SURVEILLANCE FUNCTION

The Takeoff Surveillance (TOS) function checks the takeoff data that the flight crew enters and selects on the FMS pages.
For more information about the takeoff surveillance function of the FMS, *Refer to DSC-22-FMS-10-70-20 Takeoff Surveillance Function*.

Ident.: DSC-22-FMS-10-10-10-00016757.0001001 / 14 APR 14

TIME FUNCTION

The time function of the FMS:
- Computes the block time and the flight time
- Enables the flight crew to define time markers
- Computes airport local times.

For more information about the time function of the FMS, *Refer to DSC-22-FMS-10-80 Time Function*.

Ident.: DSC-22-FMS-10-10-10-00016759.0001001 / 14 APR 14

PRINT FUNCTION

The print function of the FMS enables the flight crew to print data and reports.

For more information about the print function of the FMS, *Refer to DSC-22-FMS-10-90 Print Function*.

Ident.: DSC-22-FMS-10-10-10-00003177.0001001 / 14 APR 14

INFORMATION DISPLAY

The FMS information appears on:
- The Multifunction Displays (MFDs)
- The Navigation Displays (NDs)
- The Primary Flight Displays (PFDs).

The MFDs and the NDs are interactive displays that the flight crew uses to enter or modify data via the Keyboard and Cursor Control Units (KCCUs).

Intentionally left blank

ARCHITECTURE

Applicable to: ALL

Ident.: DSC-22-FMS-10-20-10-00009741.0001001 / 14 APR 14

There are two flight management systems:
- FMS 1, on the side of the Captain
- FMS 2, on the side of the First Officer.

Each FMS uses a computer, referred to as the Flight Management Computer (FMC).

The flight crew uses the following controls and displays to interface with each FMS:
- 1 Multifunction Display (MFD)
- 1 Navigation Display (ND)
- 1 Primary Flight Display (PFD)
- 1 EFIS Control Panel (EFIS CP)
- 1 Keyboard and Cursor Control Unit (KCCU).

Other Aircraft Systems
FMC-C

Ident.: DSC-22-FMS-10-20-10-00003651.0001001 / 01 SEP 16

FMC

There are three FMCs:
- FMC-A
- FMC-B
- FMC-C.

In normal operation:
- FMC-A provides data to FMS 1
- FMC-B provides data to FMS 2
- FMC-C is the backup FMC.

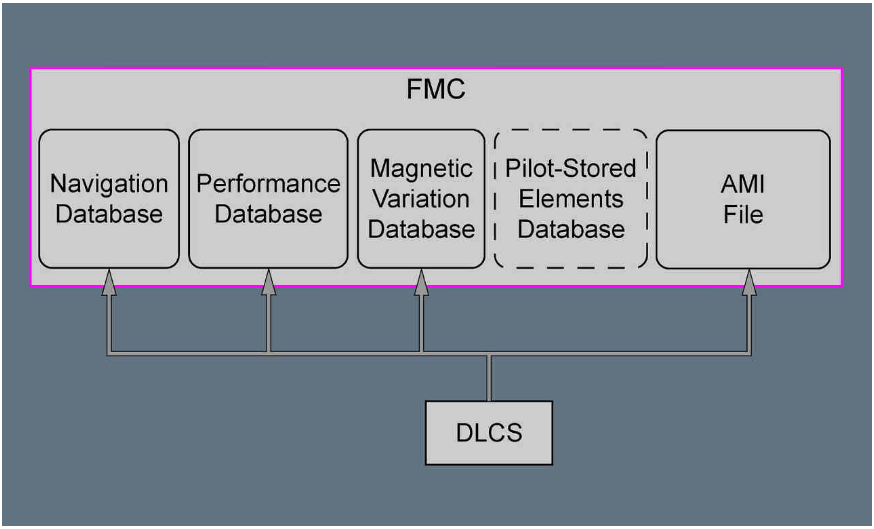
Of the two active FMCs, one FMC is referred to as the "master", the other as the "slave". The selection of the master FMC is based on which Autopilot (AP) is engaged, and on the position of the FMS selector.
The two active FMCs independently calculate data, and then share, compare, and synchronize this data.
The backup FMC also independently performs some simple calculations. For more information, *Refer to DSC-22-FMS-40 Normal Operation*.

FMC DATABASES

Each FMC has four databases:
- Navigation database
- Performance database
- Magnetic variation database
- Pilot-stored elements database.

L3 Some FMS data can be customized, by using the Airline Modifiable Information (AMI) file.

FMC Databases



FMC
Navigation Database
Performance Database
Magnetic Variation Database
Pilot-Stored Elements Database
AMI File
DLCS

Ident.: DSC-22-FMS-10-20-10-00003652.0001001 / 14 APR 14

L2 NAVIGATION DATABASE

The navigation database provides standard navigation data: Navaids, waypoints, airports, runways, airways, holding patterns, company routes, terminal area procedures (SID, STAR, approach), MSA, and MORA.
This data is stored for two successive 28-day cycles.

L3 The Operator defines, obtains, updates, loads, and uses this data.

L2 The ACFT STATUS panel of the DATA/STATUS page provides the database validity period, with both start date and end date information.

L3 The part number of the navigation database is also displayed on the ACFT STATUS panel of the DATA/STATUS page.

L2 For more information, *Refer to DSC-22-FMS-20-20-20 DATA/STATUS Page*.
If the current date disagrees with the database cycle, the CHECK DATABASE CYCLE message is displayed in the FMS message area on the MFD.

DATA PAGES

The flight crew can display the waypoints, navaids, routes, and airports (with runways), that are stored in the navigation database, on the DATA pages. The DATA pages are accessed via the DATA menu on the general menu bar.

DATA/ROUTE Page

DATA/AIRPORT Page

Ident.: DSC-22-FMS-10-20-10-00003653.0001001 / 14 APR 14

L2 PERFORMANCE DATABASE

The performance database is used for the computation of FMS performance parameters, flight plan predictions and optimization, and takeoff performance checks.

L3 The performance database includes the engine model, aerodynamic model, and performance model.

The Operator cannot modify this database.

The FMS P/N panel of the DATA/STATUS page displays the part number of the performance database.

For more information, *Refer to DSC-22-FMS-20-20-20 DATA/STATUS Page*.

Ident.: DSC-22-FMS-10-20-10-00003654.0001001 / 14 APR 14

L2 MAGNETIC VARIATION DATABASE

The magnetic variation database provides magnetic variation data that the FMS uses to compute local magnetic variation.

L3 The aircraft manufacturer updates this database.
The FMS P/N panel of the DATA/STATUS page displays the part number of the magnetic variation database.
For more information, *Refer to DSC-22-FMS-20-20-20 DATA/STATUS Page*.

Ident.: DSC-22-FMS-10-20-10-00003655.0001001 / 14 APR 14

L2 PILOT-STORED ELEMENTS DATABASE

The pilot-stored elements database stores the waypoints, navaids, runways, and routes that the flight crew created. The contents of this database are limited to:

- 99 waypoints
- 20 navaids
- 10 runways
- 5 routes (with a maximum size of 30 flight plan elements per route).

The pilot-stored elements can be deleted:

- Manually: At any time, with the DELETE ALL function on the ACFT STATUS panel of the DATA/STATUS page
- Automatically: After each flight (This is an optional feature that Operators can activate via the AMI file).

All pilot-stored elements are deleted, when all FMCs are shut down.
The ACFT STATUS panel of the DATA/STATUS page displays the number and types of pilot-stored elements.
For more information, *Refer to DSC-22-FMS-20-20-20 DATA/STATUS Page*.

DATA PAGES

The flight crew can create waypoints, navaids, routes, and airports/runways, that will be stored in the pilot-stored elements database, on the DATA pages. The DATA pages are accessed via the DATA menu on the general menu bar.

L3 AIRLINE MODIFIABLE INFORMATION (AMI) FILE

The Airline Modifiable Information (AMI) file is also referred to as the FMS Airline Configuration file.

The AMI file provides the following set of FMS data, that Operators can customize:
- Software options (e.g. DIR TO default option (with abeam/without abeam))
- Airline policy values (e.g. THR RED altitude, ACC altitude)
- Fuel policy values (e.g. taxi fuel, route reserve %,)

- Policy values for the COMPANY COM application (e.g. flight-plan request (Yes/No), performance data request (Yes/No))
- Policy values for the ATC datalink system (e.g. ATC free text (Yes/No)).

An Operator can define one or more AMIs for its entire fleet, as needed.
The FMS P/N panel of the DATA/STATUS page displays the part number of the AMI file.
For more information, *Refer to DSC-22-FMS-20-20-20 DATA/STATUS Page*.

Ident.: DSC-22-FMS-10-20-10-00003658.0001001 / 14 APR 14

L3 DATA LOADING AND CONFIGURATION SYSTEM (DLCS)

The DLCS is used to load all databases (except the pilot-stored elements database) and the configuration files in the FMC.

Ident.: DSC-22-FMS-10-20-10-00003659.0001001 / 14 APR 14

MFD

The MFD displays FMS textual data. There are more than 50 FMS pages that provide information about the flight plan, aircraft position, and flight performance.
The MFD is interactive. Therefore, the flight crew can move from one FMS page to another, and can display, enter, or modify data via the KCCU.
For more information, *Refer to DSC-22-FMS-20-20-10 Overview*.

Ident.: DSC-22-FMS-10-20-10-00003660.0001001 / 14 APR 14

KCCU

The flight crew uses the KCCU to:
- Display the FMS pages on the MFD
- Enter and modify data on the MFD FMS pages
- Perform some flight plan revisions on the ND.

For more information, *Refer to DSC-22-FMS-20-30 KCCU Controls for the FMS*.

Ident.: DSC-22-FMS-10-20-10-00003661.0001001 / 14 APR 14

PFD AND ND (EFIS)

The PFD and the ND display graphical and textual information that is related to flight management.
The upper part of the ND displays the lateral part of the flight plan, and the lower part of the ND (referred to as the VD) displays the vertical part of the flight plan.
On the upper part of the ND, the flight crew can make some changes to the lateral part of the flight plan via the KCCU.

For more information about:
- The ND, *Refer to DSC-22-FMS-20-50 ND*
- The PFD, *Refer to DSC-22-FMS-20-40 FMS Data on the PFD*.

Ident.: DSC-22-FMS-10-20-10-00003662.0001001 / 14 APR 14

EFIS CP

With the EFIS CP, the flight crew controls the graphical and textual FMS data that appear on the ND.
For more information, *Refer to DSC-22-FMS-20-60 EFIS CP*.

Ident.: DSC-22-FMS-10-20-10-00003663.0001001 / 14 APR 14

FMS SELECTOR

In the case of an FMS failure, the flight crew uses the FMS selector in order to display:
- FMS 1 data on both sides of the cockpit, or
- FMS 2 data on both sides of the cockpit.

For more information, *Refer to DSC-22-FMS-20-70 FMS Selector*.

Ident.: DSC-22-FMS-10-20-10-00003650.0001001 / 17 APR 14

L2 OTHER AIRCRAFT SYSTEMS

The FMS interfaces with the following aircraft systems, via the avionics network:

AIR CONDITIONING SYSTEM

The FMS transmits: The number of passengers for temperature control and fresh air supply.

AIR DATA/INERTIAL REFERENCE SYSTEM (ADIRS)

The FMS receives:
- Position data to define the navigation accuracy, and to compute the FMS position
- Air data parameters for flight plan predictions
- The aircraft time reference (date and UTC time).

The FMS transmits:
- Reference position for IR alignment
- The FMS position to compute the aircraft position
- QNH, runway elevation, and temperature at destination for the FLS function
- Manual settings for the aircraft time reference (date and UTC time).

AIR TRAFFIC CONTROL (ATC) DATALINK SYSTEM

The FMS receives: Uplink messages from the ATC center to be loaded in the FMS.
The FMS transmits: Downlink report messages and aircraft parameters to the ATC center.

AIRPORT NAVIGATION FUNCTION

The FMS receives: Data related to the airport and runway where the aircraft is currently, for takeoff check computation.
The FMS transmits: Airport (departure, destination, and alternate) and runway data.

AUXILIARY POWER UNIT (APU)

The FMS receives: The APU fuel used for the Fuel On Board (FOB) computation (The APU serves as a backup to the FQMS).

AVIONICS COMMUNICATION ROUTER (ACR)

The FMS receives: Uplink messages from the company ground station.
The FMS transmits: Downlink messages and aircraft parameters to the company ground station.

CABIN INTERCOMMUNICATION DATA SYSTEM (CIDS)

The FMS transmits: The number of passengers and the destination Estimated Time of Arrival (ETA) for water heating and galley management.

CENTRAL MAINTENANCE SYSTEM (CMS)

The FMS transmits: All FMS maintenance messages.

DATA LOADING AND CONFIGURATION SYSTEM (DLCS)

The FMS receives: Software and databases to be loaded in the FMS.

DIGITAL FLIGHT DATA RECORDER (DFDR)

The FMS transmits: All data that must be recorded to analyze any event.

ENGINES

The FMS receives:

- Engine parameters for the computation of flight plan predictions, FMS flight phases, and takeoff checks
- The engine fuel used for the FOB computation (The engines serves as a backup to the FQMS).

FCU BACKUP

The FMS receives: Display mode, range, and options parameters.

FLIGHT WARNING SYSTEM (FWS)

FMS transmits: Data for the triggering of alerts and dispatch messages.

FUEL QUANTITY AND MANAGEMENT SYSTEM (FQMS)

The FMS receives: Weight, CG, and fuel data for FMS prediction update.
The FMS transmits: Weight, CG, and fuel data for FQMS initialization.

FUEL TANK INERTING SYSTEM

The FMS transmits: The remaining time that is necessary to reach the top of descent.

LANDING GEAR EXTENSION AND RETRACTION SYSTEM (LGERS)

The FMS receives: Flight/ground information.

MULTI-MODE RECEIVER (MMR)

The FMS transmits: Approach data (e.g. FLS beam, type of the approach that the flight crew selected).

NAVAIDS

The FMS receives: Radio position data for FMS position computation.

ONBOARD INFORMATION SYSTEM (OIS)

The FMS transmits: The flight number and the origin/destination city-pair for the OIS applications.

COMPANY COM Application

The FMS receives: Out-Off-On-In (OOOI) events for the time function (computation of block time and flight time).
The FMS transmits: Flight plan data.

OXYGEN SYSTEM

The FMS transmits: The destination airport elevation for oxygen control.

PERMANENT DATA

The FMS transmits: Time data that the flight crew defines or selects via the POSITION/TIME page.

PRESSURIZATION SYSTEM

The FMS transmits: Vertical flight plan data for cabin pressurization.

PRIMARY FLIGHT CONTROL AND GUIDANCE COMPUTER (PRIM)

The FMS receives: Data from the Flight Guidance (FG), the Flight Envelope (FE), and other specific systems (e.g. anti-ice system).
The FMS transmits: Data for the FG and the FE.

PRINTER

The FMS transmits: FMS data to be printed.

RADIO MANAGEMENT PANEL (RMP)

The FMS transmits: Data for VOR, DME, and MMR tuning.

L3 SECURE COMMUNICATION INTERFACE (SCI)

The FMS receives: Aircraft time reference for the time function (The SCI serves as a backup to the ADIRS).

L2 SLATS/FLAPS SYSTEM

The FMS receives: Flap setting for the computation of flight plan predictions and takeoff checks.

SURVEILLANCE (SURV)

The FMS transmits: Navigation and flight plan data.

Aircraft Position

AIRCRAFT POSITION

Ident.: DSC-22-FMS-10-30-10-00009744.0001001 / 14 APR 14
Applicable to: ALL

The ADIRS computes the aircraft position and the position accuracy. The ADIRS also determines the navigation mode.
Based on ADIRS data, the FMS defines the navigation accuracy.
For more information about aircraft position, position accuracy, navigation accuracy, and navigation modes, *Refer to DSC-34-NAV-20-10-60 Position Computation*.

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-30-10-00003667.0001001 / 14 APR 14
Applicable to: ALL

All of the information about the aircraft position, navigation modes, position accuracy, and navigation accuracy is available on 5 specific POSITION pages on the MFD.
The flight crew can access these pages via the POSITION menu on the general menu bar.

Radio Navigation Tuning

DESCRIPTION

Applicable to: ALL

Ident.: DSC-22-FMS-10-30-20-10-00000520.0004001 / 14 APR 16

The FMS automatically tunes:

- The navaids that are used for the aircraft position computation
  For information about aircraft position computation, *Refer to DSC-22-FMS-10-30-10 Aircraft Position*.
- The navaids for display on the ND
- The landing system.

The navaids that are displayed on the ND and the landing system can also be manually tuned on the POSITION/NAVAIDS page (*Refer to page*).
Manual tuning has always priority over automatic tuning.

L2 *Note:* *In the case of a triple FMC failure, the flight crew can manually tune the navaids that are displayed on the ND and the landing system, via the Radio Management Panel (RMP).*
For more information, Refer to DSC-34-NAV-70-10 STBY RAD NAV.

L1 In FMS DUAL and INDEPENDENT modes, each FMS tunes its onside navaids. On each side;

FMS 1 can tune:

- 1 VOR
- 4 DMEs
- 1 ADF ◁
- 1 landing system.

FMS 2 can tune:

- 1 VOR ◁
- 4 DMEs
- 1 ADF ◁
- 1 landing system.

L3 NAVAIDS TUNING AND FMS SELECTOR

The position of the FMS selector determines the FMS (FMS 1 or FMS 2) that tunes the navaids on both sides:

- NORM: The navaids are tuned, depending on the FMS operational mode:
  - DUAL and INDEPENDENT modes: Each FMS tunes its onside navaids
  - Single mode: The valid FMS tunes the navaids on both sides
- BOTH ON CAPT: FMS 1 tunes the navaids on both sides
- BOTH ON F/O: FMS 2 tunes the navaids on both sides.

Ident.: DSC-22-FMS-10-30-20-10-00000536.0001001 / 14 APR 16

VOR TUNING

In normal operation, FMS 1 can tune VOR 1 and FMS 2 can tune VOR 2 . The FMS uses the same VOR for display on the ND as the one that is used to compute the aircraft position.

L3 The VOR that will be tuned is selected in accordance with the following order of priority (the first-listed has the highest priority):

- The VOR that the flight crew manually selected
- The VOR that is specified for the approach, if a RNAV, VOR, or VOR/DME approach is selected and the TO waypoint of the flight plan is one of the approach waypoints
- The VOR that is specified for the active flight leg
- The VOR that is required to compute the aircraft position
- The TO waypoint, if it is a VOR
- The nearest down-path waypoint, if it is a VOR
- The FROM waypoint, if it is a VOR
- The VOR that is the nearest to the aircraft present position.

Ident.: DSC-22-FMS-10-30-20-10-00000537.0001001 / 14 APR 14

DME TUNING

In normal operation, each FMS can tune four DMEs at the same time.

L3 Each FMS can tune the DMEs as follows:

- One DME for display on the ND
  This DME can be manually or automatically tuned.
  The DME that will be tuned is selected in accordance with the same order of priority as the one that applies to the VOR tuning.
  If a VOR/DME is tuned to compute the aircraft position, the same VOR/DME will also be used for display on the ND.
- Two DMEs to compute the aircraft position
  These navaids are automatically tuned.
- One DME that is associated with ILS/DME, for display on the PFD.

Ident.: DSC-22-FMS-10-30-20-10-00000539.0001001 / 14 APR 16

ADF TUNING

In normal operation, FMS 1 can tune the ADF 1 and FMS 2 can tune the ADF 2 .

L3 The ADF that will be tuned is selected in accordance with the following order of priority (the first-listed has the highest priority):

- The ADF that the flight crew manually selected
- The ADF that corresponds to the NDB that is specified for the approach, if an NDB approach is selected and the TO waypoint of the flight plan is one of the approach waypoints
- The TO waypoint, if it is an NDB
- The FROM waypoint, if it is an NDB.

Ident.: DSC-22-FMS-10-30-20-10-00000538.0002001 / 14 APR 16

LANDING SYSTEM TUNING

In normal operation, each FMS can tune one landing system (ILS, GLS ◁ , or SLS ◁).

L3 The landing system that will be tuned is selected in accordance with the following order of priority (the first-listed has the highest priority):

- The landing system that the flight crew manually selected

  Note: The flight crew cannot manually tune the SLS ◁ .

- The landing system that is associated with the takeoff runway, selected on the ACTIVE/F-PLN/DEPARTURE page, if the active flight phase is PREFLIGHT or T.O
- The landing system that is associated with the approach, selected on the ACTIVE/F-PLN/ARRIVAL page, if the active flight phase is CLB, CRZ, DES, APPR, or GA, and the direct distance to the destination airport is less than 300 NM.

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-30-20-00000534.0004001 / 14 APR 16
Applicable to: ALL

On the MFD, the POSITION/NAVAIDS page displays information about the automatically-tuned navaids.
The POSITION/NAVAIDS page also enables the flight crew to manually tune the navaids.
The lower part of the POSITION/NAVAIDS page displays the parameters of the selected landing system. The flight crew can manually tune the landing system, by entering its parameters in the appropriate entry fields.
For more information, *Refer to DSC-22-FMS-20-20-20 POSITION/NAVAIDS Page*.

Polar Navigation

INTRODUCTION

Ident.: DSC-22-FMS-10-30-30-00003689.0001001 / 17 APR 14
Applicable to: ALL

When a flight is scheduled to cross high latitude areas (beyond 60 ° of latitude), the flight crew must take various precautions, about the ADIRS, FG, FMS, and EFIS.

These precautions are based on:
- The change from MAG to TRUE heading(track) reference, due to the airway reference changes in high latitude, or due to the IRs, unable to provide magnetic heading
- Some particularities due to the pole overfly.

ADIRS

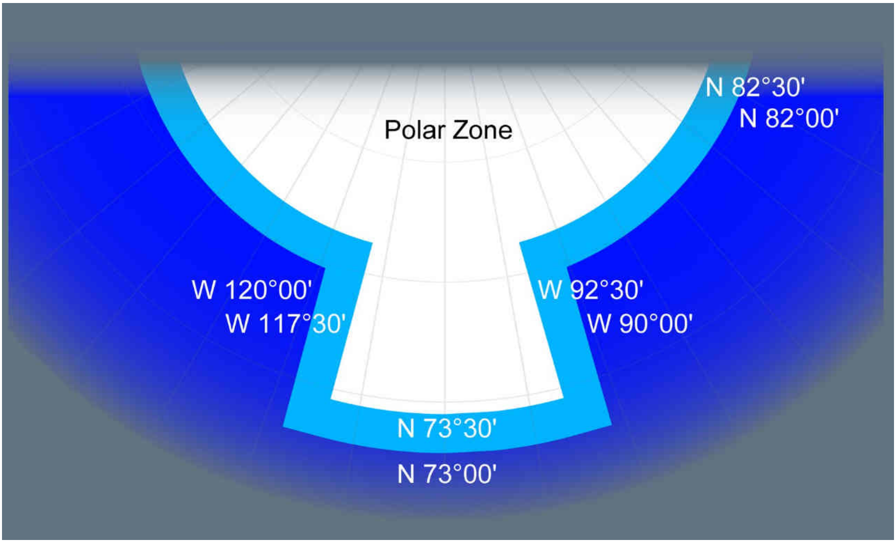
Ident.: DSC-22-FMS-10-30-30-00003690.0001001 / 02 OCT 14
Applicable to: ALL

IR ALIGNMENT

Up to latitude 73 ° N(S), the flight crew can align the IRs without any particular procedures.
Between 73 ° N(S) and 82 ° N(S), the required alignment time is longer than the alignment time below 73 ° N(S).
Beyond 82 ° N(S), no IR alignment is possible.

TRUE/MAG REFERENCE

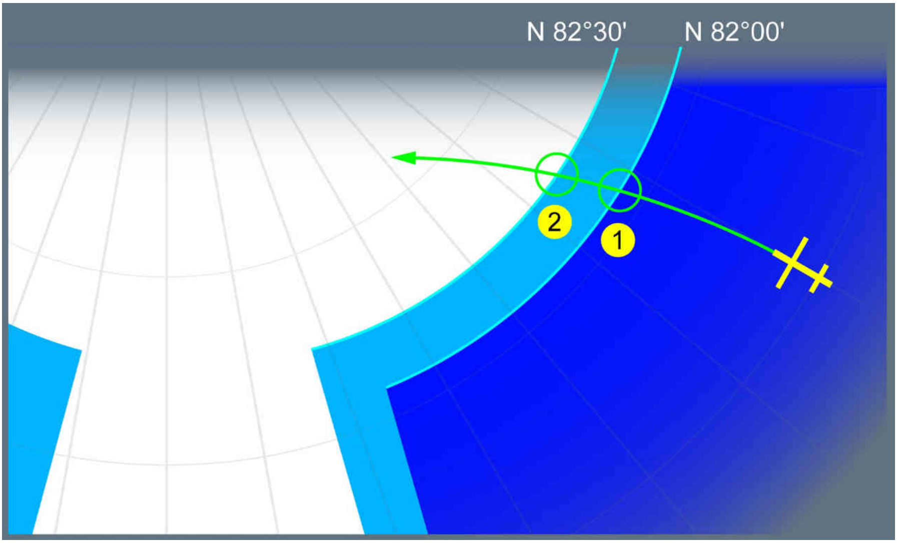
The ADIRS is able to provide TRUE heading(track), regardless of the aircraft latitude.
The ADIRS is able to provide MAG heading(track) between latitudes 82 °30' N and 60 °30' S, except in the vicinity of the magnetic pole:



Note: 1. *The latitude and longitude values, given in this diagram, are average values. In reality, the polar area involves different hysteresis, combined with the track angle penetration of the aircraft in the zone.*

2. *Although located outside the above polar zone, Thule airport is TRUE oriented.*

The flight crew selects the TRUE reference by pressing the TRUE/MAG pb, or the change is done automatically when the aircraft enters the polar zone with MAG still selected. In this case, the following messages and alerts are displayed:



- When in 1, the MFD and ND display the SELECT TRUE NORTH REF message
- When in 2 and MAG reference is still selected, the following events will occur:
  - The IRs automatically revert from MAG to TRUE
  - The TRUE label appears on the ND and PFD heading scales, and the grid track information appears on the ND
  - The NAV EXTREME LATITUDE alert is triggered
  - The autopilot may disconnect, and the NAV CAPT & F/O HDG DISAGREE alert (associated with the CHECK HDG message on the PFD and ND) may be triggered. (This happens, when the IRs do not reach the polar zone simultaneously.)

Note: *The messages and alerts are triggered, as soon as the first IR reaches the polar zone. After the flight crew clears the messages and alerts, the messages and alerts will not be displayed again when the other two IRs enter the polar zone.*

FLIGHT GUIDANCE

Ident.: DSC-22-FMS-10-30-30-00003691.0001001 / 14 APR 14
Applicable to: ALL

When the flight crew manually changes the heading reference from MAG to TRUE or vice versa, there is no discontinuity in the lateral guidance, whether the mode is NAV or HDG/TRACK.

When an automatic TRUE/MAG switching occurs when entering the polar zone, the autopilot may disengage, due to the fact that the automatic switching does not occur simultaneously for the three IRs.
If TRUE is selected, CAT II and CAT III ILS approaches cannot be flown.

FLIGHT MANAGEMENT

Ident.: DSC-22-FMS-10-30-30-00003692.0001001 / 14 APR 14
Applicable to: ALL

AIRPORT NORTH REFERENCE

A takeoff with TRUE reference is very rare. During the preflight phase, if the cockpit north reference is TRUE, the following indications remind the flight crew of this selection:
- The ND and MFD display the CHECK NORTH REF message, if the departure airport north reference is MAG
- The TRUE label above the PFD/ND heading scales flashes for 10 s at slat extension
- The TRUE NORTH REF memo pulses for 10 s at engine start, or at slat extension.

Before approach, if the cockpit north reference is TRUE, the following indications remind the flight crew of this selection:
- The ND and MFD display the CHECK NORTH REF message, when the aircraft reaches the arrival area (approximately 25 NM from destination) and the destination airport north reference is MAG
- The TRUE label above the PFD/ND heading scales flashes for 10 s at slat extension
- The TRUE NORTH REF memo pulses for 10 s at slat extension.

FMS TRACK AND BEARING

The FMS computes the tracks, bearings, and radials based on the TRUE/MAG cockpit selection. If the selection is TRUE, the unit of the track, bearing, and radial values and entry fields becomes °T.

When the flight crew wants to create a PBD, PB/PB waypoint or define a radial (DIR TO - CRS IN or DIR TO - CRS OUT), the entry rule is as follows:
- If the flight crew inserts the value with its reference (M for magnetic, or T for true), the FMS takes into account the entered reference
- If the flight crew inserts the value without its reference, the FMS takes into account the cockpit TRUE/MAG selection.

CONTROLS AND INDICATORS

ADF ◁ BEARING DISPLAY

The ADF needle indicates the relative bearing between the aircraft and the NDB.
Therefore, the ADF relative-bearing information is independent of the TRUE/MAG selection, and the ADF needle always points in the same direction, regardless of the TRUE/MAG selection.

VOR BEARING DISPLAY

The VOR bearing is measured by the VOR, at the VOR location:

- It is a TRUE bearing, if the VOR station is TRUE referenced
- It is a MAG bearing, if the VOR station is MAG referenced.

When the ND display mode is ARC or ROSE-NAV, the flight crew can simultaneously display the VOR data and the FMS flight plan data. It is important that the FMS and the VOR raw data have the same north reference.
Therefore, if the aircraft north reference and the VOR station north reference are not the same, the VOR raw bearing is corrected with the magnetic variation at the aircraft present position. In this case, the VOR needles appear in magenta, and the ND displays CORR next to the VOR label.

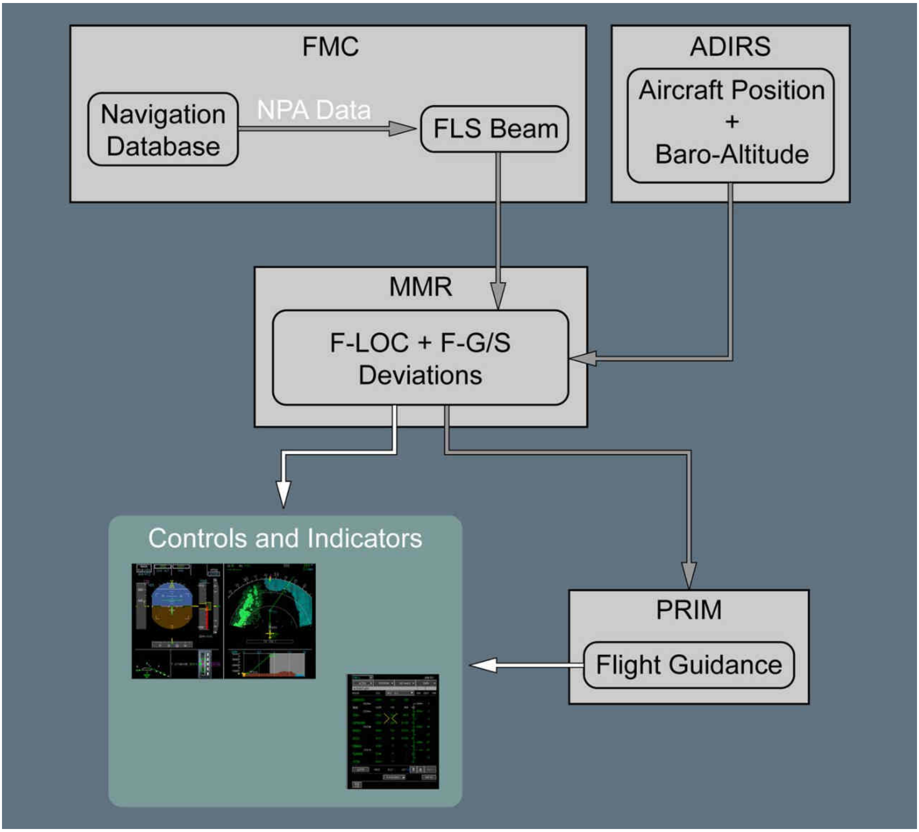
FLS Function within FMS

OVERVIEW

Ident.: DSC-22-FMS-10-30-40-00003695.0001001 / 28 APR 17
Applicable to: ALL

The FMS Landing System (FLS) function provides the flight crew with cockpit indications and guidance to fly a non-precision approach (VOR, VOR/DME, NDB, LCTR, or RNAV) in an ILS look alike way.
The FMS computes a final approach path, referred to as the FLS beam, and sends it to the MMR.
The ADIRS sends the aircraft position and baro-altitude to the MMR.
The MMR computes the deviations between the aircraft position and the FLS beam.
The MMR sends these pseudo LOC and pseudo G/S deviations (referred to as F-LOC and F-G/S deviations) to the PRIM for flight guidance, and to the PFD and ND for display.

FLS



FMC
Navigation Database
NPA Data
FLS Beam
ADIRS
Aircraft Position + Baro-Altitude
MMR
F-LOC + F-G/S Deviations
Controls and Indicators
PRIM
Flight Guidance

The flight crew can also use the FLS function to fly an ILS approach with glide slope out, or a LOC only (or LOC B/C) approach.

In this case, the flight guidance uses:
- The ILS LOC beam (LOC) for lateral guidance
- The FLS G/S beam (F-G/S) for vertical guidance.

LOC/FLS

Note: *The FLS function is available only for approaches that are stored in the navigation database.*

FLS BEAM COMPUTATION

Applicable to: ALL

Ident.: DSC-22-FMS-10-30-40-10-00003696.0001001 / 14 APR 14

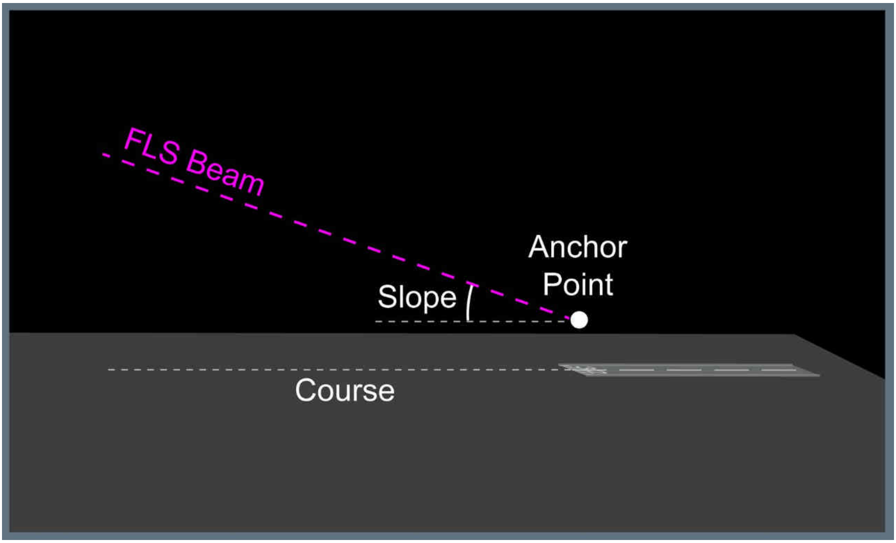
FLS BEAM COMPUTATION

The FMS computes an FLS beam, when the flight crew:
- Inserts a VOR, NDB, RNV, GPS, LOC, or BAC approach (on the ARRIVAL page)
- Inserts an ILS approach (on the ARRIVAL page), and deselects the glide slope (on the POSITION/NAVAIDS page).

The FLS beam corresponds to the final-approach flight leg of the Non Precision Approach (NPA).

The FLS beam is defined by:
- An anchor point
- A course
- A slope.

FLS Beam



CAUTION	The FLS beam is a virtual beam that can be captured up to 100 NM from the destination. As the FLS beam is a virtual beam, the FLS beam can go through terrain obstacles.

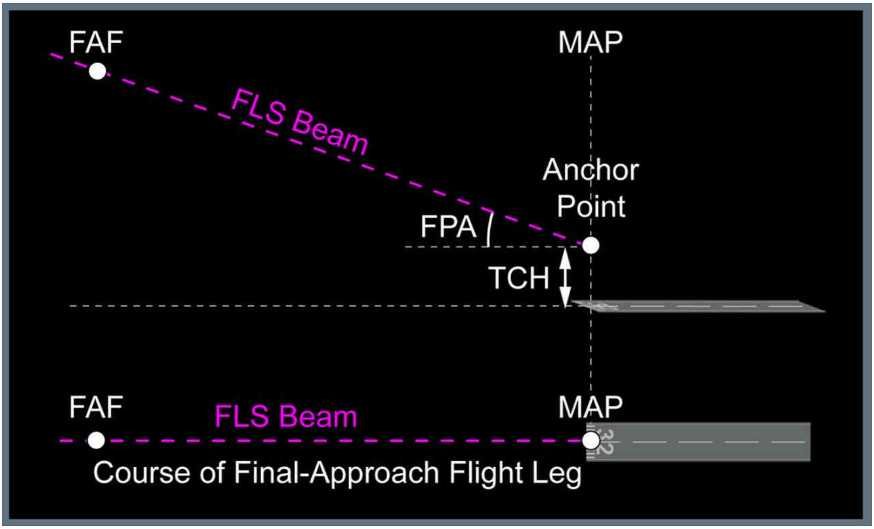
L2 The layout of the FLS beam is based on the relative position of the Missed Approach Point (MAP) to the runway threshold.

MAP IS ON THE RUNWAY THRESHOLD

When the MAP of the approach is defined on the runway threshold (+/- 0.14 NM):

- The anchor point is on the runway threshold, at the Threshold Crossing Height (TCH) (or threshold height + 50 ft, if no TCH is stored in the database)
  The ident of the anchor point is the ICAO code of the airport, followed by the threshold runway identifier (e.g. LFBO32L).
- The course of the FLS beam is the course of the final-approach flight leg
- The slope of the FLS beam is the Flight Path Angle (FPA) that is stored with the runway threshold in the navigation database.

MAP on Runway Threshold



MAP IS BEFORE THE RUNWAY THRESHOLD

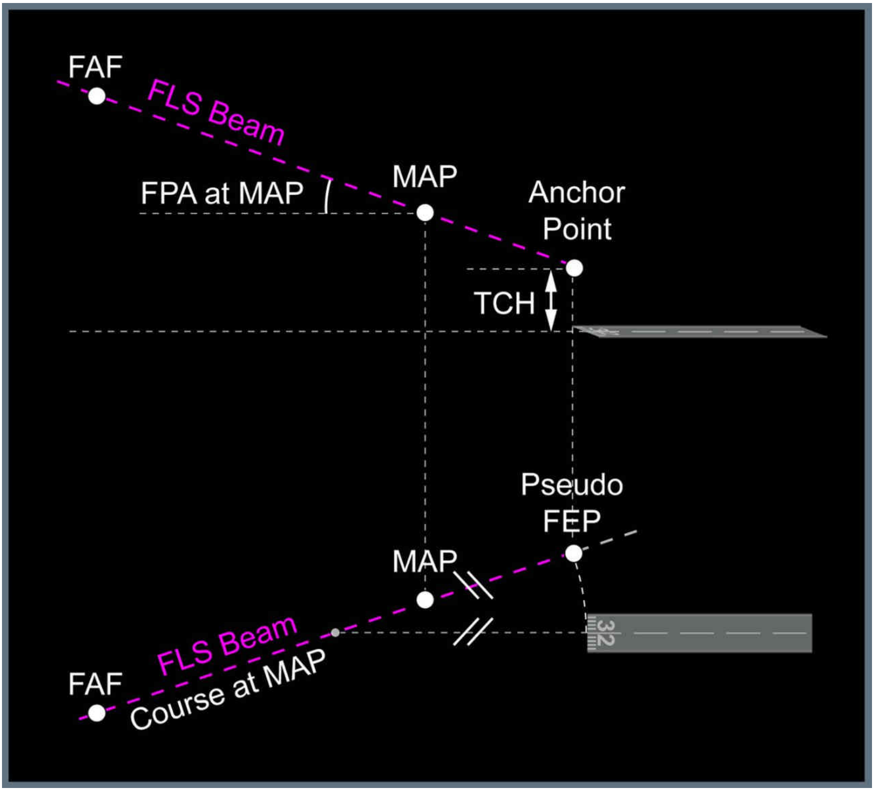
When the MAP of the approach is before the runway threshold:

- The anchor point is on a pseudo Final End Point (FEP) (that is computed by the FMS) at the TCH (or threshold height + 50 ft, if no TCH is stored in the database).
  The ident of the anchor point is EPxxx. The "xxx" corresponds to the ident of the runway (e.g. EP32L).

L3 *Note: When the anchor point is at less than 0.1 NM from the runway threshold, the ident of the anchor point is the ICAO code of the airport, followed by the threshold runway identifier (e.g. LFBO32L).*

L2
- The course of the FLS beam is the course that is stored with the MAP in the navigation database
- The slope of the FLS beam is the FPA that is stored with the MAP in the navigation database.

MAP before Runway Threshold



FAF
FLS Beam
FPA at MAP
MAP
Anchor Point
TCH
Pseudo FEP
MAP
FLS Beam
FAF
Course at MAP
32

MAP IS BEYOND THE RUNWAY THRESHOLD

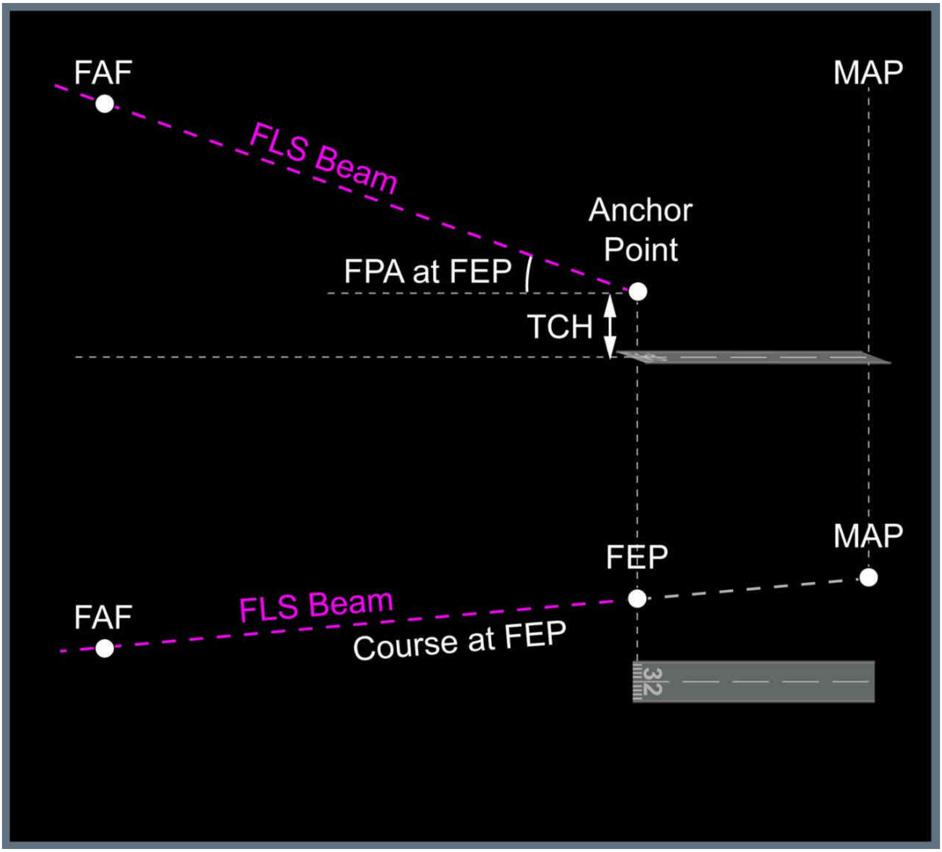
When the MAP of the approach is beyond the runway threshold:

- The anchor point is on the FEP (that is stored in the navigation database) at the TCH (or threshold height + 50 ft, if no TCH is stored in the database)
  The ident of the anchor point is the ident of the FEP (e.g. EP32L).

L3 *Note: When the anchor point is at less than 0.1 NM from the runway threshold, the ident of the anchor point is the ICAO code of the airport, followed by the threshold runway identifier (e.g. LFBO32L).*

L2
- The course of the FLS beam is the course that is stored with the FEP in the navigation database
- The slope of the FLS beam is the FPA that is stored with the FEP in the navigation database.

MAP beyond Runway Threshold



FAF
MAP
FLS Beam
Anchor Point
FPA at FEP
TCH
MAP
FEP
FAF
FLS Beam
Course at FEP
32

NO FLS BEAM COMPUTED

The FMS does not compute the FLS beam:
- For IGS without G/S, SDF, and LDA approaches, or
- If all of the following occur:
  - The MAP is before the runway threshold
  - The angle between the course of the final-approach flight leg and the runway course is more than 50 °.

If the FMS does not compute the FLS beam, the FLS function is not available: The FMS message area displays the NO FLS FOR THIS APPR message.

Ident.: DSC-22-FMS-10-30-40-10-00005113.0001001 / 14 APR 14

BARO-CORRECTION OF THE FLS BEAM

When the barometric reference is STD, the computation of the FLS beam and the F-G/S deviation is based on the QNH that is entered on the APPR panel of the PERF page (*Refer to page*).
If no QNH is entered, a QNH of 1 013 hPa is considered for the computation of the FLS beam. However, in that case, no F-G/S deviation is computed.
When the barometric reference is QNH, the computation of the FLS beam and the F-G/S deviation is based on the current QNH.

Ident.: DSC-22-FMS-10-30-40-10-00005114.0001001 / 20 OCT 14

COLD WEATHER CORRECTION OF THE FLS BEAM

When the temperature at destination (that is entered on the APPR panel of the PERF page (*Refer to page*)) is below the ISA temperature, the computation of the FLS beam and the F-G/S deviation is corrected with the entered temperature.
If no temperature is entered, the ISA temperature is considered at destination.

Note: *The temperature correction is only done for the computation of the FLS beam and the F-G/S deviation, and does not change the barometric aircraft altitude on the PFD.*

L2 For more information about the display on the VD in the case of cold weather, *Refer to DSC-31-CDS-40-50 Vertical Trajectory*.

L2 The FMS sends the FLS beam to the ND.

L1 The FLS beam appears as a magenta dashed line (with a length of 80 NM) on the upper part of the ND and on the VD.

L2 When the anchor point is a point that is stored in the navigation database, the anchor point is displayed in green. The green color indicates that the anchor point is a flight plan waypoint. When the anchor point is a pseudo end point that is computed by the FMS, the anchor point is displayed in magenta. The magenta color indicates that the anchor point is a virtual point.

For information about the FLS beam computation, *Refer to DSC-22-FMS-10-30-40 FLS Beam Computation*.

L1 The FLS beam appears, when all of the following occur:
- The flight crew selected an NPA for the active flight plan
- The flight crew pressed the LS pb on the EFIS CP
- The flight crew selected an ND range that is less than or equal to:
  - 80 NM in ARC or PLAN mode, or
  - 160 NM in ROSE-NAV mode.

Note: *The FLS beam is displayed on the VD, only when the vertical cut is defined along the flight plan (or along the LS axis).*

ILS Indications

The PFD displays:

FLS and ILS Modes and FLS Capability on the FMA

The FMA displays:

- The AP/FD modes:
  - In FLS: F-LOC, F-LOC*, F-LOC, F-G/S, F-G/S*, and F-G/S
  - In LOC/FLS: LOC, LOC*, LOC, F-G/S, F-G/S*, and F-G/S
- The FLS capability: F-APP, F-APP+RAW, or RAW ONLY.

L2 The PRIM sends the AP/FD modes and the FLS capability to the PFD.

L1 For more information about the FMA, *Refer to DSC-22-FG-90-80 Overview*.

FLS and ILS Indications

L2 The MMR sends the FLS and ILS indications to the PFD.

L1 For information about the display of xLS indications on the PFD, *Refer to DSC-31-CDS-40-20-110 xLS Approaches*

FLS Guidance Indication
ILS Guidance Indications

In ROSE-LS mode, the ND displays:

Approach Ident

Indicates the ident of the selected non-precision approach.

FLS and ILS Data

Indicates:

- The active landing system: FLS1, FLS2, LOC/FLS1, or LOC/FLS2
  In the label of the active landing system, the number corresponds to the MMR that computes the FLS data (e.g. FLS1 means that MMR 1 computes the data).
  L2 MMR 1 sends the FLS data to the ND of the First Officer, and MMR 2 sends data to the ND of the Captain.
- L1 The FLS beam slope
- The FLS beam course
- One of the following:
  - In FLS: The anchor point ident
  - In LOC/FLS: The ILS ident.

FLS and ILS Guidance Indications

Indicate:
- The course and the lateral deviation:
  - In FLS: The course of the FLS beam and the F-LOC deviation
  - In LOC/FLS: The course of the LOC beam and the LOC deviation
    When the approach is flown in LOC/FLS, the label LOC (or B/C) is displayed next to the deviation bar.
- The F-G/S deviation.
  When the approach is flown in LOC/FLS , the label F-G/S is displayed above the deviation scale.

L2 The MMR sends the guidance indications to the ND.

L1 For more information about the display of the FLS and ILS data and guidance indications on the ND in ROSE-LS mode, *Refer to DSC-31-CDS-40-40-60 ROSE-LS Mode Overview*.

Applicable to: ALL

On the MFD, the FMS message area displays the following messages:
- ENTER DEST DATA (*Refer to message*)
- F-G/S BASED ON ISA (*Refer to message*)
- NO FLS FOR THIS APPR (*Refer to message*).

HOW TO PERFORM AN NPA WITH THE FLS FUNCTION

Ident.: DSC-22-FMS-10-30-40-00003699.0001001 / 14 APR 14
Applicable to: ALL

For information on how to perform an NPA with the FLS function, *Refer to DSC-22-FG-70-80-00 Sequence of the Approach Guidance*.

For scenario examples:
- For a VOR approach that the flight crew performs with the FLS function, *Refer to DSC-22-FG-70-110-90 VOR Approach Flown with FLS Function*
- For a LOC only approach that the flight crew performs with the FLS function, *Refer to DSC-22-FG-70-110-90 LOC only Approach Flown with FLS Function*.

Intentionally left blank

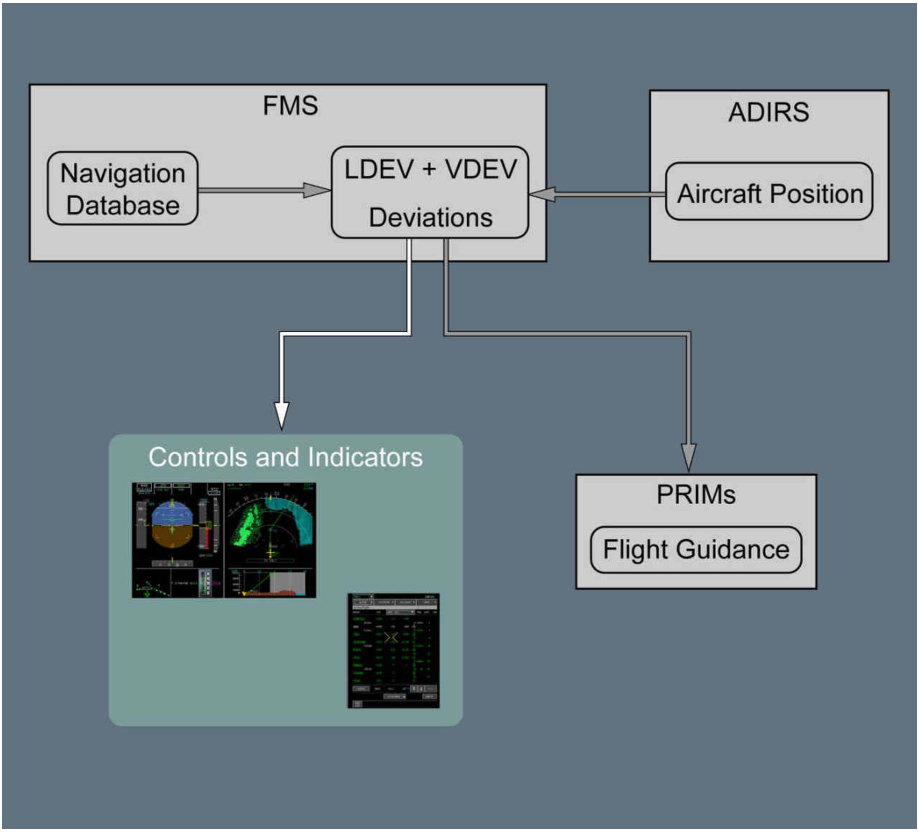
RNP AR Function

OVERVIEW

Ident.: DSC-22-FMS-10-30-50-00020515.0001001 / 02 OCT 14
Applicable to: ALL

The Required Navigation Performance with Authorization Required (RNP AR) function provides the flight crew with cockpit indications and guidance to fly all published RNP AR procedures, provided that the flight crew have special authorization.
The Air Data/Inertial Reference System (ADIRS) sends the aircraft position to the Flight Management System (FMS).
The FMS computes the deviations between the aircraft position and the theoretical flight path stored in the navigation database.
The FMS sends the Lateral Deviation (LDEV) and the Vertical Deviation (VDEV) to the Primary Flight Control and Guidance Computer (PRIM) for flight guidance, and to the PFD and ND for display.

RNP AR overview



FMS
Navigation Database
LDEV + VDEV
Deviations
ADIRS
Aircraft Position
Controls and Indicators
PRIMs
Flight Guidance

The RNP AR function is basically RNP 0.1 capable. No indication informs the flight crew that the aircraft is RNP 0.1 capable. However, if the default capability is not met because of a failure affecting the RNP AR capability, the ECAM and/or the ND display dedicated indications.
The RNP AR function automatically activates during the flight of a RNP AR procedure selected by the flight crew. However, the required navigation precision for RNP AR procedures can only be met if the guidance is in NAV mode, with FD or AP ON.

Note: *For RNP AR procedures strictly below 0.3 NM, the flight crew must engage one AP.*

LDEV AND VDEV COMPUTATION

Ident.: DSC-22-FMS-10-30-50-00020524.0001001 / 04 SEP 14
Applicable to: ALL

The FMS computes the lateral and vertical deviations with both:
- The flight plan, based on the Navigation Database
- The aircraft position provided by ADIRS.

The two active FMCs (FMC-A and FMC-B) compute the LDEV and the VDEV. In addition, during RNP AR procedures, FMC-C also computes the LDEV, but keeps its role of backup FMC.

Note: *HUD ✇ displays the same guidance modes and the same deviation scales as PFD. However, HUD does not display RNP AR title.*

LATERAL AND VERTICAL DEVIATION AREA

The RNP AR lateral scale automatically appears during RNP AR procedures. The RNP AR vertical scale automatically appears during RNP AR procedures, if FMS flight phase is DES or APPR.

If the lateral deviation is above the current RNP value:
- The aircraft reference flashes
- The lateral deviation scale flashes
- The lateral deviation flashes.

If the aircraft is more than 75 ft below the flight plan and FAF is sequenced:
- The aircraft reference flashes
- The vertical deviation scale flashes
- The vertical deviation flashes.

For more information, *Refer to DSC-31-CDS-40-20-110 RNP AR/RNAV(RNP) Departures and Approaches*.

GUIDANCE MODES

The flight crew usually fly the RNP AR procedures with AP ON and FD ON. If AP OFF and FD ON, RNP AR is limited to RNP 0.3.
The lateral guidance mode for RNP AR procedures is NAV. Upon Go-Around initiation, the NAV mode remains engaged.
The vertical guidance mode for RNP AR procedures is APP-DES after the FAF.

Ident.: DSC-22-FMS-10-30-50-10-00020533.0001001 / 04 SEP 14

Cross Track Error
RNP value of the active leg

L2 VD does not display RNP AR information.

L1 **CROSS TRACK ERROR**

When the flight crew fly a RNP AR procedure, the value of the cross track error appears with two precision digits if the value is below 0.30 NM.
The cross track error pulses if its value is above the current RNP value.
For more information on Cross Track Error, *Refer to DSC-31-CDS-40-40-80 Cross Track Error*.

RNP VALUE APPLICABLE TO THE ACTIVE LEG

While the flight crew fly an RNP AR procedure, the FMS message zone on the ND displays the RNP value applicable to the active leg. The RNP value message depends on the RNP value source, with the following priority:

MAN RNP X.XX : when the flight crew manually selects the RNP value in the POSITION/MONITOR page

LEG RNP X.XX : when the navigation database provides the RNP value

AREA RNP X.XX : when the RNP value is the flight area RNP value.

PROCEDURE IDENTIFICATION

For more information, *Refer to DSC-31-CDS-40-40-80 Departure and Approach Name*.

Ident.: DSC-22-FMS-10-30-50-10-00020535.0001001 / 04 SEP 14

RNP AR PROCEDURE SELECTION

The flight crew selects the RNP AR procedure via the DEPARTURE or ARRIVAL MFD pages.
RNP AR procedures are identified by the suffix (RNP), like on navigation charts.
In the ACTIVE/F-PLN/DEPARTURE page, the flight crew may select a RNP AR procedure in the SID list or in the TRANS list (*Refer to DSC-22-FMS-20-20-20 DEPARTURE Page*).
On the ACTIVE/F-PLN/ARRIVAL page, the flight crew may select a RNP AR procedure in the APPR list or in the VIA list (*Refer to DSC-22-FMS-20-20-20 ARRIVAL Page*).
L2 An approach with xLS guidance may be associated with a RNP AR missed approach. The approach procedure name has then the suffix (RNP).

L1 *Note:* *On the RNAV(RNP) navigation chart, different minima may be identified, associated with several RNP values. For a RNP AR procedure, the navigation database codes the lowest RNP value. If necessary, the flight crew modifies the current RNP value in the POSITION/MONITOR MFD page.*

Ident.: DSC-22-FMS-10-30-50-10-00020536.0001001 / 20 OCT 14

FLIGHT LEG RNP

Indicates the RNP value associated with the flight leg.
The displayed RNP is the RNP value that is stored in the navigation database.
For additional information, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

DITTO MARK

A ditto mark (“) appears instead of the Flight Leg RNP, if the RNP value remains the same as the previous Flight Leg RNP.

For additional information, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

Ident.: DSC-22-FMS-10-30-50-10-00020537.0001001 / 04 SEP 14

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following messages:
- RNP PROC ERROR: FPLN/NDB MISMATCH RE-ENTER PROC(S) (*Refer to DSC-22-FMS-20-90 RNP PROC ERROR: FPLN/NDB MISMATCH RE-ENTER RNP PROC(S)*)
- PROC RNP IS XX.XX (*Refer to DSC-22-FMS-20-90 PROC RNP IS XX.XX*)

ABNORMAL OPERATIONS

Applicable to: ALL

Ident.: DSC-22-FMS-10-30-50-20-00020019.0001001 / 04 DEC 14

RNP AR CAPABILITY

The aircraft is capable to perform RNP AR operation down to 0.1 in takeoff, approach and/or missed approach.

RNP AR CAPABILITY MONITORED BY THE PRIMS

PRIMs compute RNP AR capability, based on loss of system redundancy, or navigation performance degradation.
For more information on required equipment monitored by the PRIMs, *Refer to PRO-SPO-PBN Required RNP AR Equipment*.

RNP AR CAPABILITY DOWNGRADED

Depending on the affected aircraft systems, the ECAM triggers either of the following:
- The ECAM alerts of the applicable aircraft systems, along with RNP AR CAPABILITY DOWNGRADED subtitle in the second line of each applicable ECAM alert title, or
- NAV RNP AR CAPABILITY DOWNGRADED ECAM alert (refer to *Refer to PRO-ABN-NAV NAV RNP AR CAPABILITY DOWNGRADED*), if the detected failure is not related to any other ECAM alert.

L2 *Note:* *If displayed, the NAV RNP AR CAPABILITY DOWNGRADED ECAM alert may disappear after:*
- *The next waypoint is sequenced. As a result, out of RNP AR operations, the flight crew may check, if necessary, the recovery of the full RNP AR capability at the next waypoint*
- *The flight crew uses, out of RNP AR operations, the DIR TO lateral revision to the next waypoint.*

L1 ECAM displays FOR RNP AR : MINIMUM LIMITED TO RNP 0.30 status.

L2 PRIMs provide RNP AR capability downgraded status during the entire flight, in order to anticipate aircraft capability to fly an RNP AR procedure.
If the flight crew manually selects the aircraft time reference on the POSITION/TIME page, the PRIMs downgrade the RNP AR capability.

L1 RNP AR CAPABILITY LOST

Depending on the affected aircraft systems, ECAM triggers either of the following:
- The ECAM alerts of the applicable aircraft systems, and the RNP AR CAPABILITY LOST subtitle in the second line of each applicable ECAM alert title, or
- NAV RNP AR CAPABILITY LOST ECAM alert (*Refer to PRO-ABN-NAV NAV RNP AR CAPABILITY LOST*), if the detected failure is not related to any other ECAM alert.

In addition, during RNP AR operation, the ND displays RNP AR CAPABILITY LOST message (*Refer to DSC-31-CDS-40-40-150 ND Messages*).
The ECAM displays RNP AR status.

L2 The PRIMs provide RNP AR capability lost status during the entire flight, in order to anticipate aircraft capability to fly an RNP AR procedure.

L1 **RNP AR CAPABILITY NOT MONITORED BY THE PRIMS**

TAWS, MFD and KCCU are required equipment for RNP AR operations.

Ident.: DSC-22-FMS-10-30-50-20-00020020.0001001 / 04 SEP 14

SPECIFIC RNP AR ALERTS

The PRIMs monitor FMS data. The triplex FMS architecture (*Refer to DSC-22-FMS-10-30-50 LDEV and VDEV computation*) enables the PRIMs to identify the FMC data that is not valid. As a result, the PRIMs reject the identified faulty FMC. In addition, the PRIMs reject the FMC in the case of FMC reset.

If the PRIMs reject one FMC, one of the following ECAM alerts is triggered:
- AUTO FLT FMS BKUP REJECTED, if the PRIMs reject the backup FMC
- AUTO FLT FMS 1 REJECTED, if the PRIMs reject the active FMC that controls FMS 1
- AUTO FLT FMS 2 REJECTED, if the PRIMs reject the active FMC that controls FMS 2.

If the PRIMs reject the two active FMCs, the following ECAM alert is triggered:
- AUTO FLT FMS 1+2 REJECTED

For more information on FMC rejected by the PRIMs, *Refer to DSC-22-FMS-40 FMC Data Not Valid during a RNP AR Procedure*.
When both FMS operate in INDEPENDENT mode during RNP AR operation, the PRIMs consider that the data of the two active FMCs is not valid. As a result, AUTO FLT FMS 1+2 REJECTED

ECAM alert is triggered. For additional information, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.

Note: *In the case of FMS INDEPENDENT mode during a RNP AR operation, the FWC triggers the AUTO FLT FMS 1+2 REJECTED alert on the ECAM. After the flight crew applies the associated procedure (i.e HDG mode engagement), the flight crew may push HDG pb to engage the NAV mode. However, if the aircraft is still on a RNP AR procedure, the NDs display again the BACKUP TRAJ and the backup guidance (from backup FMC) activates again. The flight crew shall modify both active flight plans in order to restore DUAL mode. Then, the flight crew can re-engage the NAV mode.*

General

INTRODUCTION

Ident.: DSC-22-FMS-10-40-10-00004389.0001001 / 14 APR 14
Applicable to: ALL

The primary purpose of the Flight Management System (FMS) is to help the flight crew with flight planning.
The flight crew can enter the **flight plan** in the FMS. This flight plan includes the intended lateral and vertical trajectory. The part of the flight plan that corresponds to the lateral part of the trajectory is referred to as the **lateral** flight plan. The part of the flight plan that corresponds to the vertical part of the trajectory is referred to as the **vertical** flight plan.
When all of the necessary data is entered, the FMS computes and displays the track, speed, altitude, time, and fuel **predictions** that are associated with the flight plan.
The flight crew can change the flight plan at any time. These changes are referred to as **lateral revisions**, if the change is made to the lateral flight plan, and **vertical revisions**, if the change is made to the vertical flight plan.
The FMS can simultaneously store four flight plans: One **active** and three **secondary** flight plans.
The FMS uses the active flight plan for lateral and vertical long-term guidance, and for radio navigation automatic tuning. The flight crew can use the secondary flight plans as a draft to compare predictions, to anticipate a diversion, or to store company, ATC, and OIS flight plans.

For more information about:
- The lateral flight plan, *Refer to DSC-22-FMS-10-40-10 Lateral Flight Plan*
- The vertical flight plan, *Refer to DSC-22-FMS-10-40-10 Vertical Flight Plan*.

LATERAL FLIGHT PLAN

DESTINATION FLIGHT PLAN

The destination flight plan is the flight plan from the departure airport to the destination airport. It has the following elements: Departure, cruise, and arrival.

DEPARTURE

The departure has the following elements:
- The takeoff runway
- The Standard Instrumental Departure (SID)
  The SID is the central part of the departure procedure.
- The departure Transition (TRANS).
  The departure TRANS is the possible trajectory between the last point of the SID and the first en-route waypoint.

The flight crew can insert or change these elements with the DEPARTURE lateral revision. For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

CRUISE

The cruise part of the lateral flight plan includes all en-route waypoints.

The flight crew can insert these elements with the AIRWAYS or INSERT NEXT WPT lateral revision. For more information about the:
- AIRWAYS revision, *Refer to DSC-22-FMS-10-40-20 Purpose*
- INSERT NEXT WPT revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

ARRIVAL

The arrival has the following elements:
- The arrival Transition (TRANS)
  The arrival TRANS is the possible trajectory between the last en-route waypoint and the first waypoint of the STAR.
- The Standard Terminal Arrival Route (STAR)
  The STAR is the central part of the arrival procedure.
- The VIA
  The VIA is the possible trajectory between the last waypoint of the STAR and the first waypoint of the approach.
- Approach and missed approach.
  The approach part includes the runway for landing at the destination airport, and the approach and missed approach procedure.

The flight crew can insert or change these elements with the ARRIVAL lateral revision. For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-22-FMS-10-40-10-10-00004393.0001001 / 14 APR 14

ALTERNATE FLIGHT PLAN

The alternate flight plan is the diversion flight plan from the destination airport to the alternate airport. The alternate flight plan has the following elements: Departure, cruise, and arrival.

The flight crew can insert the alternate airport with the ALTERNATE lateral revision. For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

The flight crew can insert the departure, cruise, and arrival elements with the DEPARTURE, AIRWAYS, INSERT NEXT WPT, and ARRIVAL lateral revisions. For more information about the:
- DEPARTURE revision, *Refer to DSC-22-FMS-10-40-20 Purpose*
- AIRWAYS revision, *Refer to DSC-22-FMS-10-40-20 Purpose*
- INSERT NEXT WPT revision, *Refer to DSC-22-FMS-10-40-20 Purpose*
- ARRIVAL revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-22-FMS-10-40-10-10-00004394.0001001 / 28 JUN 18

FLIGHT PLAN WAYPOINTS

The flight plan is defined by waypoints, and flight legs between the waypoints.

There are four different types of flight plan waypoints:
- Navigation database waypoints
  These waypoints are part of the navigation database (e.g. DVL, TOU, LFBO). The flight crew inserts these waypoints as part of a company route, or independently via a lateral revision.
- Flight-crew-created waypoints

  The flight crew can insert the following waypoints that they created:
  - Latitude/longitude waypoints
  - Place/distance waypoints
  - Place/bearing/distance waypoints
  - Place-bearing/place-bearing waypoints
  - Latitude/longitude crossing waypoints
  - Radial intersection waypoints
  - Circle intersection waypoints
  - Abeam waypoints.

L2 The latitude/longitude, place/distance, and place/bearing/distance waypoints, created by the flight crew, are stored in the pilot-stored elements database.
The other flight-crew-created waypoints are not stored in the pilot-stored elements database. Therefore, they are memorized only until they are sequenced.
For more information about the pilot-stored elements database, *Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database*.

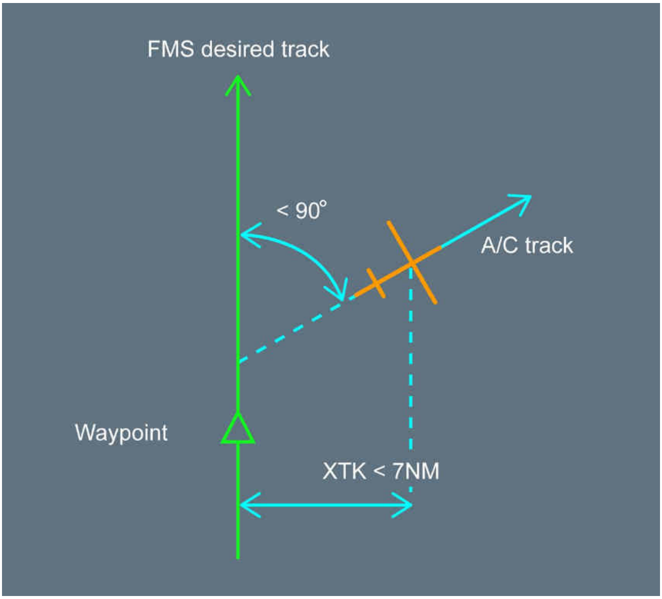
L1

- FMS-created waypoints
  For some flight plan revisions, the FMS inserts a waypoint to indicate a revision in the flight plan (e.g. T-P, IN-BND, OUT-BND).
- Pseudo waypoints.
  Pseudo waypoints are reference points that indicate a vertical flight plan event (e.g. (T/C), (SPDLIM), (T/D)). The pseudo waypoints do not affect the lateral flight plan.
  For more information, *Refer to DSC-22-FMS-10-40-10 Pseudo Waypoints*.

SEQUENCED WAYPOINT

When the lateral managed mode is engaged, a flight plan waypoint is sequenced, when the aircraft overflies (or flies near) the waypoint.

In HDG/TRK mode, a flight plan waypoint is sequenced if all of the following conditions are met:
- The waypoint is behind the aircraft
- The XTK between the FMS lateral flight plan and the aircraft is less than 7 NM
- The angle between the current aircraft track and the FMS desired track is less than 90 °.



Note: *If the flight crew revises the lateral flight plan with the DIR TO COURSE IN function, the waypoints of the revised flight plan are sequenced when the aircraft is in the above mentioned conditions.*

FROM, TO, AND NEXT WAYPOINTS

The FROM waypoint of the flight plan is the last sequenced waypoint.

Note: *The FROM waypoint is the aircraft present position (P.POS), when the aircraft is in a flight plan discontinuity and the next flight plan is not activated.*

The TO waypoint is the next waypoint that will be sequenced.
The NEXT waypoint is the waypoint that will be sequenced after the TO waypoint.

DOWN-PATH AND UP-PATH WAYPOINTS

A down-path waypoint is a waypoint of the flight plan that is between the present position of the aircraft (or another specific waypoint of the flight plan) and the destination airport.
An up-path waypoint is a waypoint of the flight plan that is between the present position of the aircraft (or another specific waypoint of the flight plan) and the departure airport.

Ident.: DSC-22-FMS-10-40-10-10-00004395.0001001 / 14 APR 14

FLIGHT LEGS

The FMS connects the flight plan waypoints with flight legs.

There are many different types of flight legs, e.g.:
- Course-to-a-fix flight leg
- Heading flight leg
- Manual flight leg
- Holding pattern flight leg
- Direct flight leg, etc.

Most of the flight leg types cannot be manually created by the flight crew. They are part of the inserted flight plan elements (company route, departure, arrival, holding pattern, airways, etc.), that are stored in the navigation database.

The flight crew can manually create:

- A holding-pattern flight leg, with the HOLD lateral revision
  For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.
- A direct flight leg:
  - Between the aircraft present position and a waypoint, navaid, or airport, with the DIR TO lateral revision
    For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.
  - Between a waypoint of the flight plan and another waypoint, navaid, or airport, with the INSERT NEXT WPT lateral revision
    For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.
  - Between two waypoints of the flight plan, by clearing the discontinuity in between with the DELETE lateral revision.
    For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

ACTIVE FLIGHT LEG

The flight leg that is between the present position of the aircraft and the TO waypoint is referred to as the active flight leg.

FLIGHT PLAN DISCONTINUITY

The flight plan has a discontinuity, if no flight leg is defined between two waypoints.

L2 *Note:* *1. The computation of flight plan predictions is based on the assumption that the aircraft will fly a direct flight leg between the waypoints that define the discontinuity.*
2. When the aircraft moves to a flight plan discontinuity, the NAV mode automatically reverts to the HDG/TRK mode. The flight plan FROM waypoint reverts to P.POS.

L1 MANUAL FLIGHT LEG

A constant course, heading, or track flight leg that has no end, and that the flight crew must manually end, is referred to as a manual flight leg.
A manual flight leg is part of a departure or arrival procedure.
The flight crew cannot manually insert a manual flight leg, except by using the DIR TO - CRS OUT revision. For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

L2 When the aircraft flies a manual flight leg, the NAV mode remains engaged. The computation of flight plan predictions is based on the assumption that the aircraft will fly a direct flight leg from its current position to the next waypoint.

Note: *The use of the DES mode is not recommended on a manual flight leg.*

L1

CAUTION	Before flying the manual flight leg, the VD display assumes that the aircraft will fly a direct flight leg from the starting point of the manual flight leg to the next waypoint.

Ident.: DSC-22-FMS-10-40-10-10-00004398.0001001 / 14 APR 14

LATERAL REVISIONS

The flight crew can change the lateral flight plan. A change to the lateral flight plan is referred to as a lateral revision.
For more information, *Refer to DSC-22-FMS-10-40-20 Overview*.

Ident.: DSC-22-FMS-10-40-10-10-00004399.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The F-PLN page displays textual lateral flight plan data that includes:
- All flight plan waypoints and flight legs
- The track and distance between two waypoints, and the distance to the destination.

ON THE ND

The ND displays graphical and textual flight plan data. The flight crew can control the display of this data via the EFIS CP.

On the upper part of the ND, the flight crew can perform three lateral revisions via the interactive ND: DIR TO, INSERT NEXT WPT, and DELETE. For more information, *Refer to DSC-31-CDS-40-40-100 Interactive ND Overview*.

VERTICAL FLIGHT PLAN

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-10-20-00004391.0001001 / 23 APR 14

The part of the flight plan that corresponds to the vertical part of the trajectory is referred to as the vertical flight plan.

The vertical flight plan includes all of the data that is required to compute the altitude, speed, and time predictions, that builds up the vertical profile of the flight plan.

The navigation database provides this data, or the flight crew manually enters this data.

L2 For more information about the navigation database, *Refer to DSC-22-FMS-10-20 Navigation Database*.

L1 There are four types of vertical data:

- General flight plan data:
  - FMS speed mode (ECON/LRC)
  - Cruise Flight Level (CRZ FL) and Cruise Temperature (CRZ TEMP)
  - Fuel and load data (ZFW, ZFWCG, block fuel)
- Flight-phase-related performance data:
  - Takeoff thrust setting (TOGA, FLX, DTO)
  - Thrust reduction and acceleration altitude
  - Climb, cruise, descent, and approach speeds
  - Pressure and temperature at destination
- Vertical constraints data:
  - Speed limits and constraints
  - Altitude constraints
  - Time constraints
  - Step climb and step descent constraints
- Wind data:
  Climb, cruise, descent, approach, and alternate flight plan winds.

For more information about:

- The general flight plan and flight-phase-related performance data, *Refer to DSC-22-FMS-10-50-10 Overview*
- The vertical constraints and wind, *Refer to DSC-22-FMS-10-40-30 Overview*.

FLIGHT PHASES

When all necessary vertical data is entered, the FMS builds up a vertical profile that is divided into 8 flight phases:

- PREFLIGHT
- Takeoff (T.O)
- Climb (CLB)
- Cruise (CRZ)
- Descent (DES)
- Approach (APPR)

- Go-Around (GA)
- DONE.

L2 *Note: The FMS flight phases are different and independent from the flight phases that other aircraft systems compute and use.*

L1 For each flight phase, the FMS computes the optimum speed/Mach profile. The FMS automatically changes from one flight phase to another, when the transition conditions are achieved.
For more information about the flight phases and the speed/Mach profiles, *Refer to DSC-22-FMS-10-50-30 Overview*.

Ident.: DSC-22-FMS-10-40-10-20-00004401.0001001 / 23 APR 14

PSEUDO WAYPOINTS

The vertical flight plan is indicated with pseudo waypoints. Each pseudo waypoint corresponds to a vertical profile event. As the vertical profile is a result of the FMS predictions computation, the position along the flight plan of the pseudo waypoints can move after a data change, or a flight plan revision.
On the MFD, the pseudo waypoints are displayed between parentheses on the F-PLN page. Each pseudo waypoint has time, speed, altitude, and wind predictions.
On the ND, the pseudo waypoints are indicated with their dedicated symbols.
For more information about the display of the pseudo waypoints on the MFD and the ND, *Refer to Controls and Indicators*.

Overview

SPDLIM

The SPDLIM pseudo waypoint is the position at which the aircraft will reach the altitude of the climb or descent speed limit.

L2 The flight crew defines the climb and descent speed limit on the SPD panel of the VERT REV page (*Refer to page*).

L1 **T/C**

The T/C pseudo waypoint is the position at which the aircraft will reach:
- The cruise altitude, or
- The descent path, if the descent path is reached before the cruise altitude, or
- The step climb altitude, if there is one.

L2 The flight crew can change the cruise flight level on the PERF page (*Refer to page*), and can define a step climb on the STEP ALTs panel of the VERT REV page (*Refer to page*).

L1 **S/C OR OPT**

The S/C pseudo waypoint is the position at which the FMS determines that the step climb should begin.

Note: *If the step climb is defined at a waypoint, the S/C pseudo waypoint is displayed on the line below this waypoint on the F-PLN page.*
If the start waypoint of the step climb is an optimum start point, the pseudo waypoint is OPT.

L2 The flight crew defines a step climb on the STEP ALTs panel of the VERT REV page (*Refer to page*).

L1 **S/D**

The S/D pseudo waypoint is the position at which the FMS determines that the step descent should begin.

Note: *On the F-PLN page, the S/D pseudo waypoint is displayed on the line below the flight plan start waypoint.*

L2 The flight crew defines a step descent on the STEP ALTs panel of the VERT REV page (*Refer to page*).

L1 **UTC**

The UTC pseudo waypoint is the position at which the aircraft will be at the UTC time that defines the time marker.

L2 The flight crew defines a time marker on the POSITION/TIME page (*Refer to page*).

L1 **T/D**

The T/D pseudo waypoint is the position at which the FMS determines that the descent should begin.

DECEL

The point at which:
- The aircraft will automatically decelerate, for an approach with the managed speed/Mach control, or
- The flight crew should begin the deceleration, for an approach with the selected speed/Mach control.

Ident.: DSC-22-FMS-10-40-10-20-00024627.0001001 / 02 FEB 18

FINAL DESCENT POINT

In the navigation database, the Final Descent Point (FDP) is the point in the approach procedure from which a constant descent path angle is defined.

Ident.: DSC-22-FMS-10-40-10-20-00004402.0001001 / 14 APR 14

VERTICAL REVISIONS

The flight crew can change the vertical flight plan. A change to the vertical flight plan is referred to as a vertical revision.
For more information, *Refer to DSC-22-FMS-10-40-30 Overview*.

Ident.: DSC-22-FMS-10-40-10-20-00004403.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The F-PLN page displays the textual vertical data, associated with the lateral flight plan. The F-PLN page displays, for each waypoint of the lateral flight plan:
- The time prediction, in Universal Time Coordinated (UTC) or in flight time (TIME)
- The Speed (SPD) prediction
- The Altitude (ALT) prediction
- The Estimated Fuel On Board (EFOB)
- The True Wind (T.WIND) prediction.

The F-PLN page displays the flight leg RNP, if the RNP value is stored in the navigation database.
A flight leg, that is part of the arrival procedure, can also have an associated Flight Path Angle (FPA).

The F-PLN page also displays the pseudo waypoints, and the speed and altitude symbols.

A pseudo waypoint is displayed between parentheses, and has time, speed, altitude, and wind predictions. Some pseudo waypoints can be displayed in amber. For these pseudo waypoints, the amber color indicates that one or both of the following occur at the pseudo waypoint:
- The aircraft is above the FMS vertical path
- There is an overspeed.

A speed or altitude constraint is indicated with a star next to the speed or altitude prediction.

ON THE ND

The upper part of the ND displays pseudo waypoints, and speed and altitude constraints. The flight crew can control the display of this data via the EFIS CP.
The VD displays the profile of the vertical flight plan in relation to weather, terrain, and safety altitudes data.
No vertical revisions are possible via the ND.

Intentionally left blank

Lateral Revisions

OVERVIEW

Ident.: DSC-22-FMS-10-40-20-00003600.0001001 / 14 APR 14
Applicable to: ALL

A change to the lateral flight plan is referred to as a lateral revision.

A lateral revision can applies:
- From a specific flight-plan waypoint that is referred to as the revised waypoint, or
- To the entire flight plan.

The flight crew can access all lateral revisions via the F-PLN page on the MFD.
To access a lateral revision that applies from a specific flight-plan waypoint, the flight crew clicks on the revised waypoint. The waypoint revisions menu opens.

The flight crew can also access the DIR TO, INSERT NEXT WPT, and DELETE revisions via the interactive ND. To access these three lateral revisions, the flight crew clicks on the revised waypoint on the flight plan on the upper part of the ND. The waypoint revisions menu opens.

LATERAL REVISION AND SECONDARY FLIGHT PLAN

All lateral revisions (except DIR TO and FIX INFO) are available for the active and secondary flight plans.

DIR TO

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-10-00003601.0001001 / 28 JUN 18

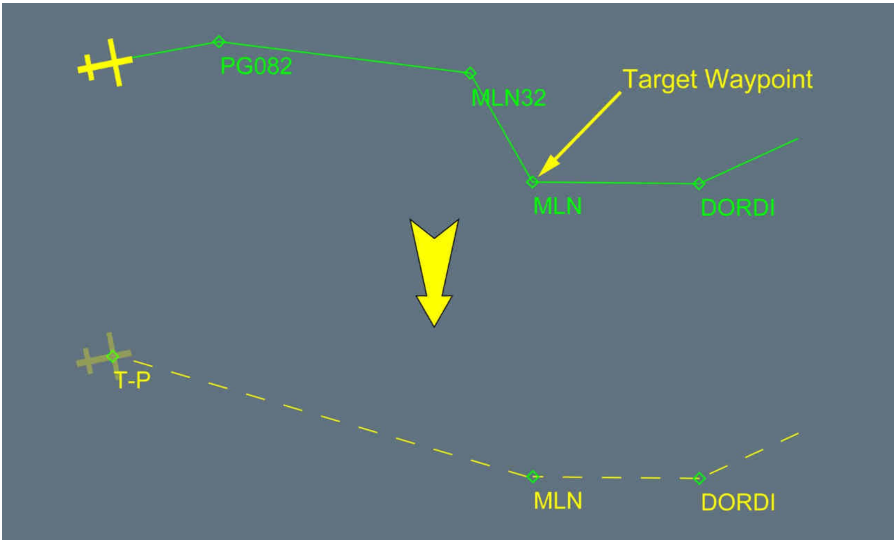
PURPOSE

The flight crew uses the DIR TO revision to create a direct (great circle) flight leg from the aircraft present position to:
- A flight plan waypoint
- Any navigation database waypoint, airport, or navaid
- A Latitude/Longitude (LL), Place/Bearing/Distance (PBD), or Place-Bearing/Place-Bearing (PB/PB) waypoint.

A DIR TO a flight plan waypoint creates a direct flight leg between the aircraft present position and the selected target waypoint. The flight plan waypoints between the aircraft present position and the selected target waypoint are deleted.

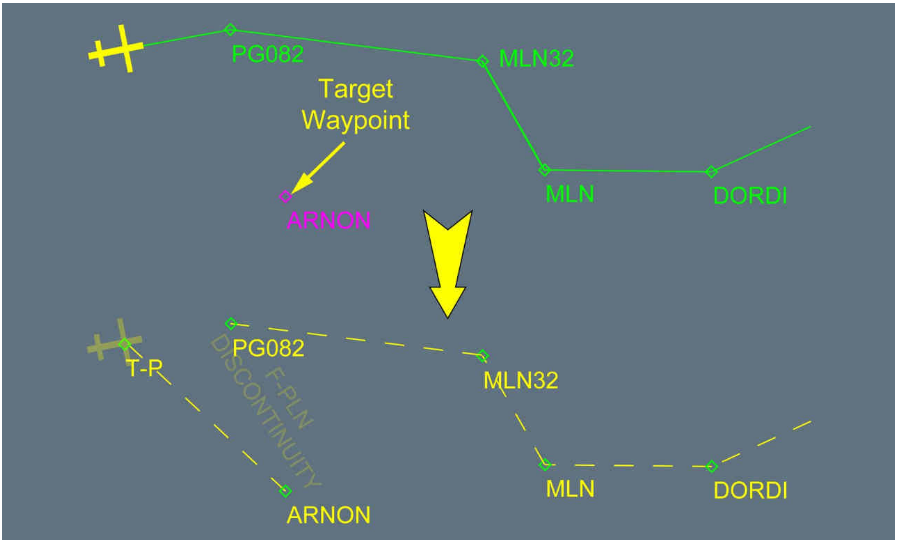
Note: *A lateral revision of the flight path obtained with a DIR TO may also affect the vertical profile of the flight plan.*

DIR TO a Flight Plan Waypoint



A DIR TO any other waypoint, that is not on the flight plan, creates a direct flight leg between the aircraft present position and the selected target waypoint, and a flight plan discontinuity between the target waypoint and the former TO waypoint.

DIR TO a Waypoint that Is Not in the Flight Plan



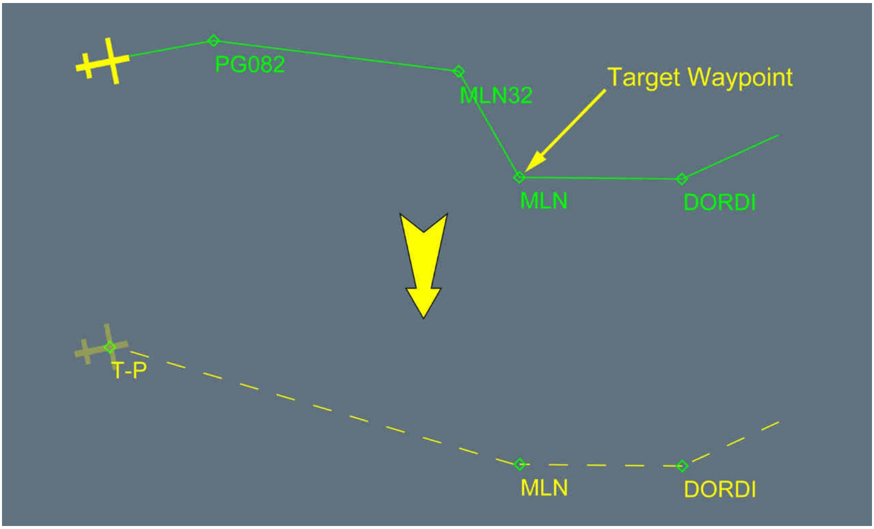
The flight crew has four options for creating the direct flight leg:

- DIR TO (DIRECT), or
- DIR TO with abeam points (DIRECT WITH ABEAM), or
- DIR TO with inbound course (CRS IN), or
- DIR TO with outbound course (CRS OUT).

DIRECT

This option creates a direct flight leg between the aircraft present position and the selected target waypoint.
If the lateral mode is HDG/TRACK or LOC, the NAV mode automatically engages when the DIR TO - DIRECT is inserted.

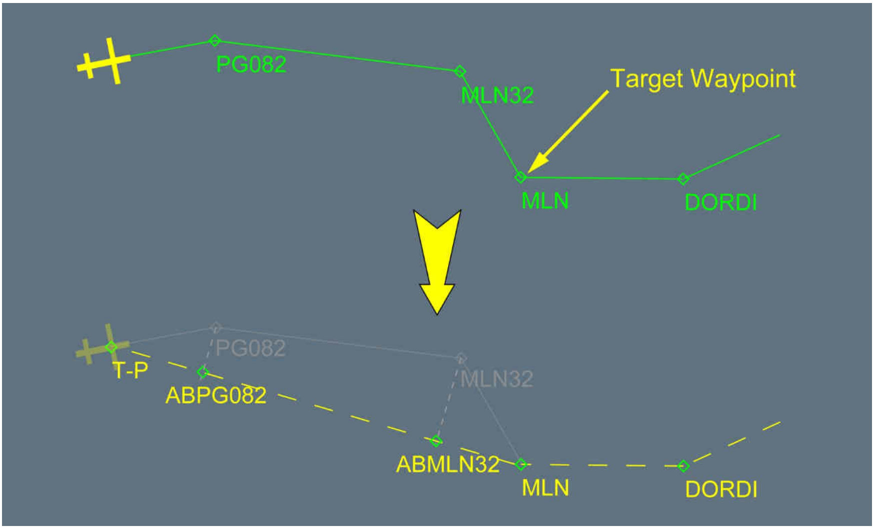
DIRECT



DIRECT WITH ABEAM

This option creates abeam waypoints along the direct flight leg. Abeam waypoints are the projections of the flight plan waypoints on the direct flight leg, that are between the aircraft present position and the selected target waypoint. The initial flight plan waypoints are deleted.
If the lateral mode is HDG/TRACK or LOC, the NAV mode automatically engages when the DIR TO - DIRECT WITH ABEAM is inserted.

DIRECT WITH ABEAM



L2 Abeam waypoints are part of the flight plan, but are not stored in the pilot-stored elements database. This means that the abeam waypoints can be used for every flight plan revision (except AIRWAYS), until they are sequenced. As soon as they are sequenced, they are no longer memorized by the FMS.

L3 When a latitude/longitude crossing, circle/radial intersection, or abeam waypoint is projected, it is recomputed by using the initial latitude/longitude and reference fix waypoint.
Speed and altitude constraints are transferred to the abeam waypoint.
Time constraint is not transferred to the abeam waypoint.
Wind data is transferred, when the distance between the abeam and the initial waypoint is less than 100 NM.

L1 CRS IN

This option creates a direct flight leg from the aircraft present position to intersect an inbound course (selected by the flight crew) of the target waypoint.
The track of the direct flight leg is the current aircraft track.

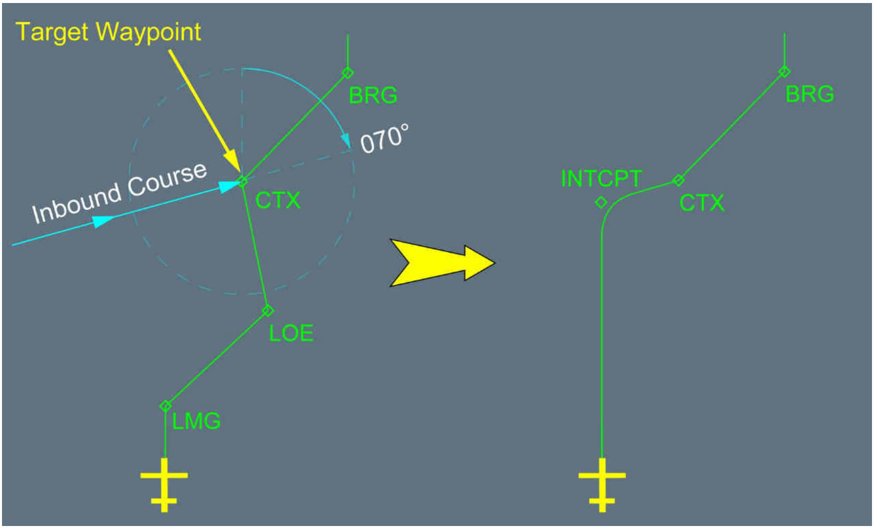
If the angle between the direct flight leg and the inbound course is less than 160 °:
- The FMS computes an intersection point
  This intersection point is the INTCPT waypoint.
- The lateral HDG/TRACK mode is engaged, and NAV is armed.

Note: *1. The INTCPT waypoint is recomputed, when the flight crew changes the aircraft track.*
2. The NAV mode engages automatically, when INTCPT is sequenced.

If the angle between the direct flight leg and the inbound course is more than 160 °:
- No intersection point is computed
- The lateral HDG/TRACK mode is engaged, and NAV is armed.

Note:
- *NAV mode does not engage, if the angle between the direct flight leg and the inbound course remains more than 160 °.*
- *Depending on the aircraft position, an automatic flight plan waypoint sequencing can occur. For more information about the waypoint sequencing, Refer to DSC-22-FMS-10-40-10 Flight Plan Waypoints.*

CRS IN



L2 When the flight crew inserts a DIR TO - CRS IN, the ADJUST DESIRED TRK OR HDG message is displayed.

This message informs the flight crew that it is possible to adjust the aircraft heading/track:
- To enable the computation of the INTCPT waypoint (if, after the heading/track change, the intersection angle becomes less than 160 °), or
- To change the position of the INTCPT waypoint (if it was previously computed).

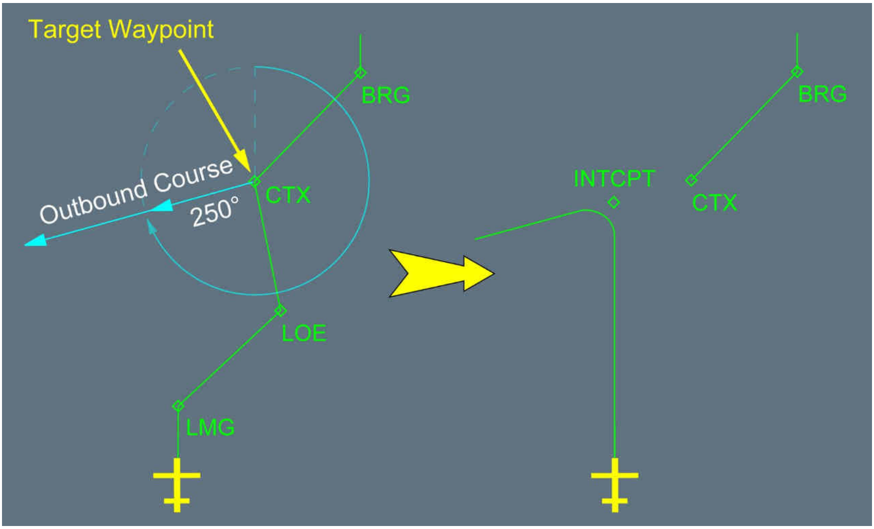
L1 CRS OUT

This option creates a direct flight leg from the aircraft present position to intersect an outbound course (selected by the flight crew) of the target waypoint.
The track of the direct flight leg is the current aircraft track.

If the direct flight leg is not parallel with the outbound course:
- The FMS computes an intersection point
  This intersection point is the INTCPT waypoint.
- The lateral HDG/TRK mode is engaged, and NAV is armed.

Note: 1. *The INTCPT waypoint is recomputed, when the flight crew changes the aircraft track.*
2. *The NAV mode automatically engages, when INTCPT is sequenced.*
3. *When INTCPT is sequenced, the aircraft is on the selected outbound-course flight leg, that is a manual flight leg (Refer to DSC-22-FMS-10-40-10 Flight Legs).*

CRS OUT



L2 When the flight crew inserts a DIR TO - CRS OUT, the ADJUST DESIRED TRK OR HDG message is displayed.
This message informs the flight crew that it is possible to adjust the aircraft heading/track, to change the position of the INTCPT waypoint (if it was previously computed).

DIR TO REVISION AND SECONDARY FLIGHT PLAN

The DIR TO revision is not available for the secondary flight plans.

DIR TO REVISION AND TEMPORARY FLIGHT PLAN

The DIR TO revision creates a temporary flight plan.
No other revisions can be made on this temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-10-00003614.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can insert a DIR TO flight leg on the DIRECT TO page.

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following message: ADJUST DESIRED TRK OR HDG (*Refer to message*).

INSERT NEXT WPT

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-20-00003602.0001001 / 14 APR 14

PURPOSE

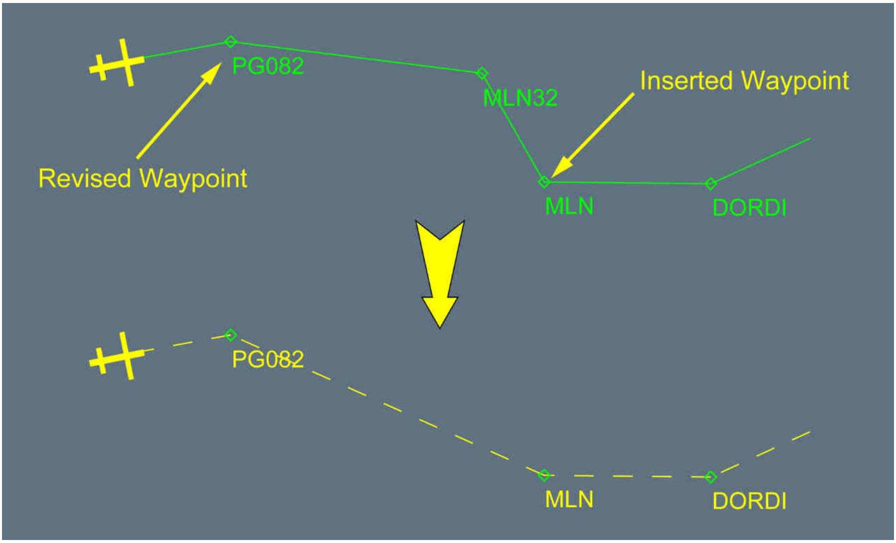
The flight crew uses the INSERT NEXT WPT revision to insert a waypoint after the revised waypoint.

The flight crew can insert:
- A flight plan waypoint
- Any navigation database waypoint, airport, or navaid
- A Latitude/Longitude (LL), a Place/Bearing/Distance (PBD), a Place-Bearing/Place-Bearing (PB/PB), or a Place/Distance (PD) waypoint.

L2 *Note:* *1. A PD waypoint, with a negative distance (e.g: LMG/-15), is inserted "before" the revised waypoint*
2. The "place" waypoint needs to be the revised waypoint.
3. The distance of the PD waypoint is limited so that the PD cannot be before (after) the waypoint that precedes (follows) the revised waypoint.

L1 If the flight crew inserts a flight plan waypoint, a direct flight leg is created between the revised waypoint and the inserted waypoint. All waypoints between the revised waypoint and the inserted waypoint are deleted.

Insert a Flight Plan Waypoint



If the flight crew inserts a waypoint that is not in the flight plan, a direct flight leg is created between the revised waypoint and the inserted waypoint, and a flight plan discontinuity is created after the inserted waypoint.

DELETE

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-30-00003603.0001001 / 14 APR 14

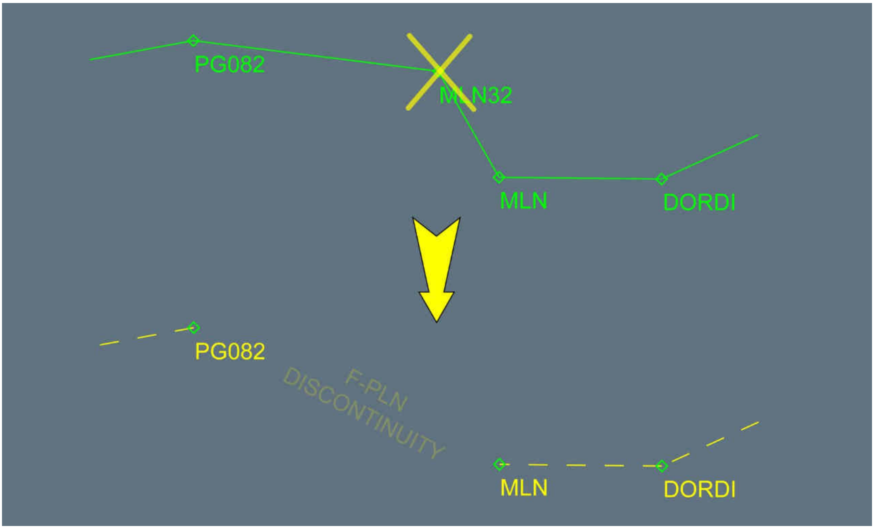
PURPOSE

The flight crew uses the DELETE revision to delete a flight plan waypoint or discontinuity.

DELETION OF A WAYPOINT

Deletion of a waypoint removes the waypoint from the flight plan and inserts a discontinuity in its place.

Deletion of a Waypoint



L2 In NAV mode, the flight crew can delete any waypoint on the flight plan, except the FROM and TO waypoint. To delete the FROM and TO waypoint, the flight crew must engage the HDG/TRACK mode first.

L3 *Note:*
1. *Deletion of the T-P, when an offset or holding pattern is active, removes the offset or the holding pattern from the flight plan.*
2. *Deletion of a holding fix removes the holding pattern from the flight plan, but does not create a discontinuity.*

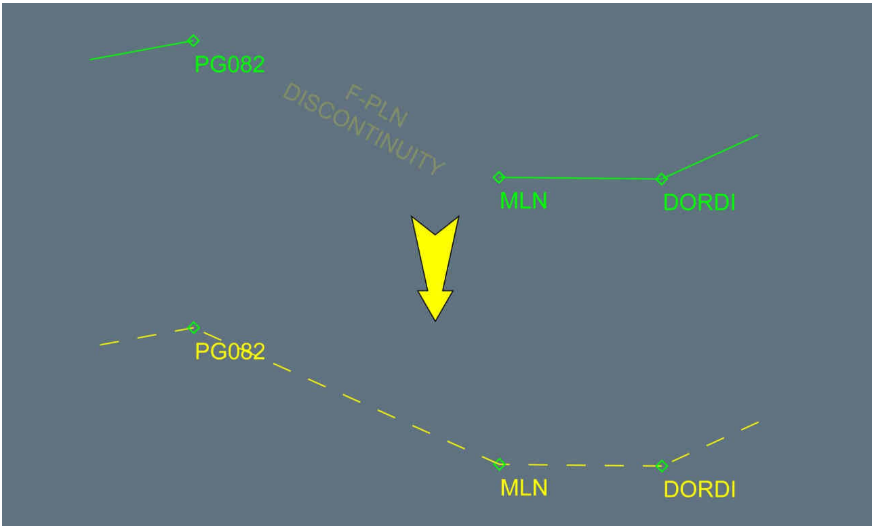
L1

DELETION OF A DISCONTINUITY

The deletion of a discontinuity:

- Removes the discontinuity from the flight plan
- Creates a direct flight leg between the waypoint that was before the discontinuity and the waypoint that was after the discontinuity.

Deletion of a Discontinuity



L2

The flight crew can delete any discontinuity in the flight plan, except a discontinuity after P.POS or a manual flight leg.

DELETE REVISION AND SECONDARY FLIGHT PLAN

The DELETE revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

DELETE REVISION AND TEMPORARY FLIGHT PLAN

The deletion of a waypoint or discontinuity creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-30-00003619.0001001 / 14 APR 14

CONTROLS AND INDICATORS

The flight crew can delete a waypoint via the MFD or on the ND. However, a discontinuity can be deleted via the MFD only.

ON THE MFD

The DELETE revision is the third revision in the waypoint revisions menu on the F-PLN page.

L2 For the waypoints that cannot be deleted, the DELETE revision is inhibited in the waypoint revisions menu.

L1 ON THE ND

The DELETE revision is the third revision in the waypoint revisions menu for a waypoint on the active (or temporary) and secondary flight plans.

For more information on the interactive ND - DELETE revision, *Refer to DSC-31-CDS-40-40-100 DELETE - Purpose*.

DEPARTURE

Applicable to: ALL

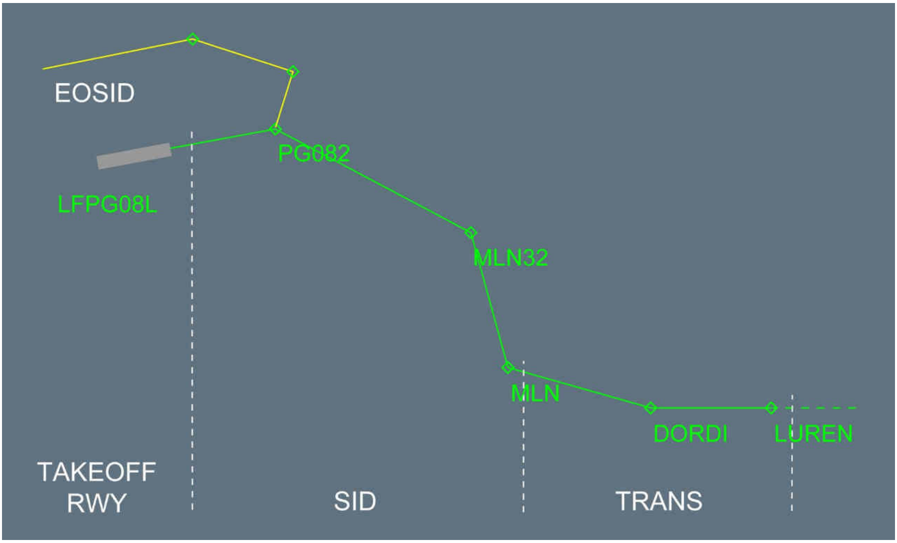
Ident.: DSC-22-FMS-10-40-20-40-00003621.0001001 / 14 APR 14

PURPOSE

The flight crew uses the DEPARTURE revision to insert, or change, the three following elements of the departure procedure:
- The takeoff runway (and the Engine-Out Standard Instrument Departure (EOSID))
- The Standard Instrument Departure (SID)
- The departure Transition (TRANS).

L2 The three above-mentioned elements are part of the navigation database (*Refer to DSC-22-FMS-10-20 Navigation Database*).

Departure Procedure



L1 The flight crew selects a compatible runway, SID, and TRANS. The FMS will connect the elements accordingly, starting with the takeoff runway, up to the en-route waypoints.

The flight crew can choose to have no SID and/or no TRANS, by selecting the NONE option.
This option is automatically selected if, for the selected takeoff runway, no SID and/or TRANS are available in the database.
If the flight crew chooses to have no SID, the FMS inserts a flight leg after the takeoff runway axis.
The flight leg stops at 1 500 ft AGL, and is followed by a discontinuity.

Note: *When a flight plan has a departure procedure (RWY+SID+TRANS), and the flight crew changes the RWY, the FMS may automatically change or delete some elements of the SID. As a result, if the flight crew changes the RWY, they should check all of the elements of the departure procedure, and correct them, if necessary.*

L3 HOW THE FMS CONNECTS THE DIFFERENT DEPARTURE ELEMENTS

The FMS searches for a waypoint of the next element (e.g. the TRANS), that is identical to the last waypoint of the previous element (e.g. the SID). The FMS connects the two elements (the SID and TRANS) at the common waypoint, and ignores all the waypoints of the next element (the TRANS) before the common point.
If no common waypoint is found between the departure procedure and the en-route flight plan, a discontinuity is inserted between them.

L2 DEPARTURE REVISION AND SECONDARY FLIGHT PLAN

The DEPARTURE revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

DEPARTURE REVISION AND TEMPORARY FLIGHT PLAN

The insertion of the entire departure procedure, or a change to an element of the departure procedure, creates a temporary flight plan. In both cases, the entire DEPARTURE revision is considered as a single lateral revision.

Ident.: DSC-22-FMS-10-40-20-40-00003622.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can insert, or change, the departure procedure on the DEPARTURE page.

The departure procedure is graphically displayed on the ND.

ARRIVAL

Applicable to: ALL

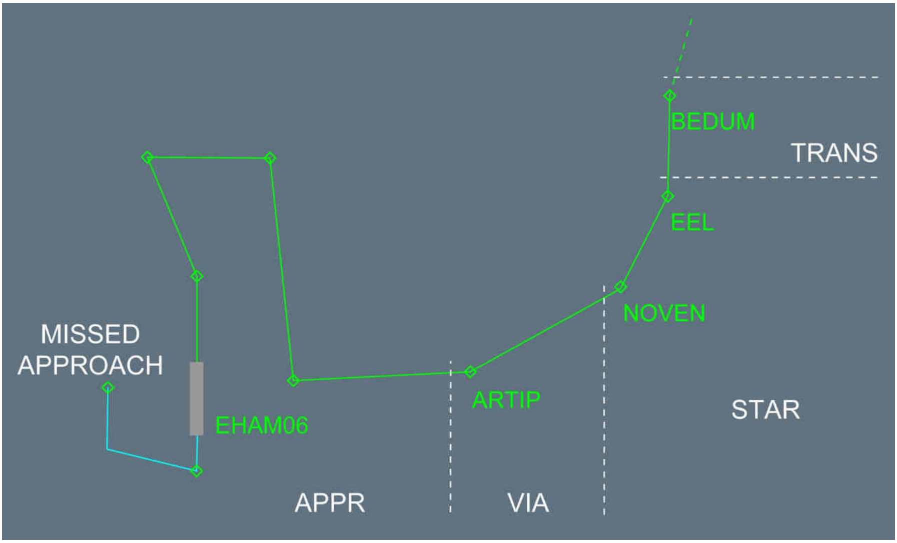
Ident.: DSC-22-FMS-10-40-20-50-00003604.0001001 / 14 APR 14

PURPOSE

The flight crew uses the ARRIVAL revision to insert, or change, the following four elements of the arrival procedure:
- The final Approach (APPR), that includes the landing runway and missed approach
- The approach transition (VIA)
- The Standard Terminal Arrival Route (STAR)
- The arrival Transition (TRANS).

L2 The four above-mentioned elements are part of the navigation database (*Refer to DSC-22-FMS-10-20 Navigation Database*).

Arrival Procedure



L1 The flight crew selects a compatible approach: STAR, VIA, and TRANS. The FMS will connect the elements accordingly, starting with the en-route waypoints, up to the landing runway.
The flight crew can choose to have no STAR, no VIA and/or no TRANS, by selecting the NONE option. This option is automatically selected if, for the selected landing runway, no STAR, VIA and/or TRANS are available in the database.

Note: *When a flight plan has an arrival procedure (APPR+VIA+STAR+TRANS), and the flight crew changes the APPR, the FMS may automatically change or delete some elements of the VIA or STAR. As a result, if the flight crew changes the APPR, they should check all of the elements of the arrival procedure, and correct them, if necessary.*

L3 HOW THE FMS CONNECTS THE DIFFERENT ARRIVAL ELEMENTS

The FMS searches for a waypoint of the next element (e.g. the STAR), that is identical to the last waypoint of the previous element (e.g. the TRANS). The FMS connects the two elements (the STAR and the TRANS) at the common waypoint, and disregards all the waypoints of the next element (the STAR) before the common point.
If no common waypoint is found between two elements, a discontinuity is inserted between them.

L2 ARRIVAL REVISION AND SECONDARY FLIGHT PLAN

The ARRIVAL revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

ARRIVAL REVISION AND TEMPORARY FLIGHT PLAN

The selection of the entire arrival procedure, or a change to an element of the arrival procedure, creates a temporary flight plan. In both cases, the entire ARRIVAL revision is considered as a single lateral revision.

Ident.: DSC-22-FMS-10-40-20-50-00003624.0001001 / 14 APR 14

OFFSET

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-60-00003605.0001001 / 06 JAN 20

PURPOSE

The flight crew uses the OFFSET revision to create a parallel path from the original lateral flight plan. The offset is defined by:

- The start waypoint

L2 The start waypoint on the flight plan is where the aircraft leaves the original flight plan to join the offset path. The start waypoint may be the aircraft present position.

L1 - The end waypoint

L2 The end waypoint on the flight plan is the first point where the aircraft is back on the original flight path.

L1 - The lateral offset distance

L2 The lateral offset distance is the lateral distance between the offset path and the original flight plan.

L1 - The offset side

L2 The offset path may either be to the left or to the right of the original flight plan. The offset side indicates the location of this offset path.

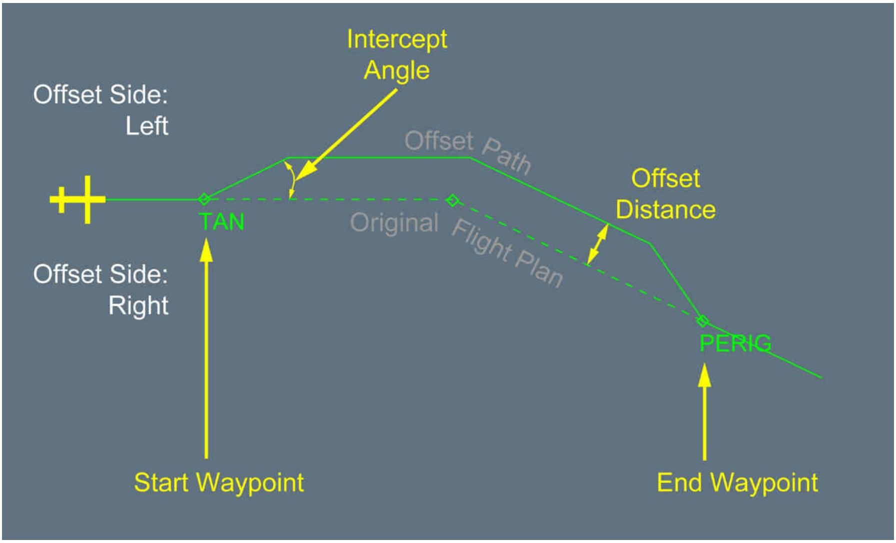
L1 - The intercept angle.

L2 The offset intercept angle is the angle between the original flight plan and the transition trajectory from the original flight plan to the offset path (or vice versa).

L12

Note: *The transition trajectory between the original flight plan and the offset path can be along more than one flight leg, if necessary.*
The insertion of an offset near a lateral turn may cancel the benefit of the offset turn anticipation because the aircraft may overshoot the offset path.

OFFSET Revision



Intercept Angle
Offset Side: Left
Offset Path
Offset Distance
TAN
Original Flight Plan
Offset Side: Right
PERIG
Start Waypoint
End Waypoint

L1 The flight crew can create only one offset path in the flight plan.
The flight crew can delete an existing offset, even if the aircraft is already flying the offset trajectory.

The flight crew can modify the offset:
- Before entering the offset trajectory
- Before flying the last leg of the offset trajectory.

Once the aircraft is flying the last leg of the offset, the flight crew should not modify the offset. If the offset is modified, the flight path will display an overshoot of the final waypoint. If this occurs, the final leg can be flown manually or exited by using one of the DIR TO functions.

Note: An existing offset path is automatically deleted if a revision of a flight plan causes the offset path to be no longer possible (for example: deletion of the start and the end waypoint).

L2 OFFSET REVISION AND SECONDARY FLIGHT PLAN

The OFFSET revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

OFFSET REVISION AND TEMPORARY FLIGHT PLAN

The insertion of an offset path, or a change of an existing offset path, creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-60-00003626.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete the offset path on the OFFSET page.

MSG LIST

For more information about the F-PLN page, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

ON THE ND

The ND always displays both the offset path (solid line) and the original flight plan (dashed line).

While the aircraft is on the offset path, the ND displays OFST XNN in the bottom left corner. The "X" corresponds to the offset side, and the "NN" corresponds to the lateral offset distance.

Note: This label is not displayed, if the FMS MORA is displayed on the ND.

For more information, *Refer to DSC-31-CDS-40-40-80 FMS Data Overview*.

OVERFLY

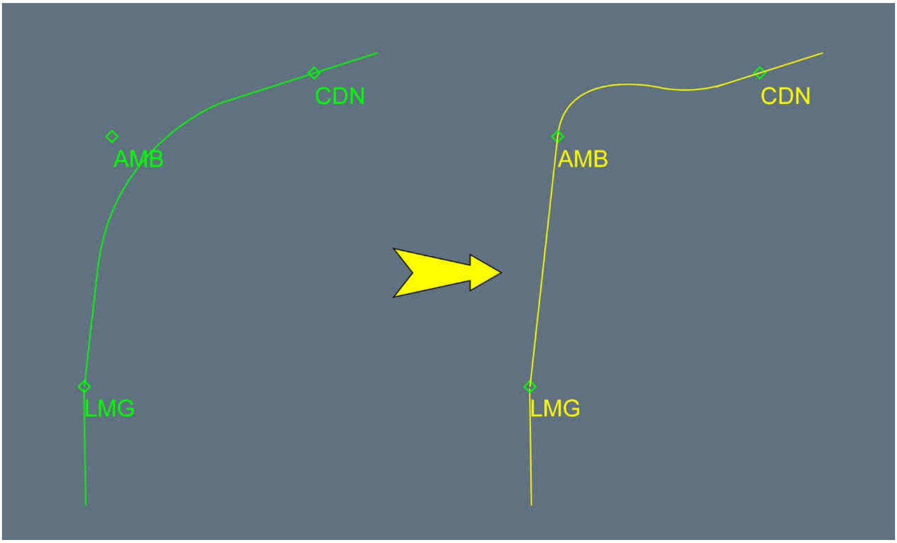
Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-70-00003608.0001001 / 14 APR 14

PURPOSE

The flight crew uses the OVERFLY revision to ensure that the aircraft overflies a specific flight plan waypoint.

OVERFLY Revision



L2 The flight crew can define an overfly on any waypoint of the flight plan, except:

- On the departure and destination airports
- On the FROM waypoint
- On a holding fix
- On a manual flight leg.

L1 When an overfly is defined on a waypoint, the flight crew can remove it with the DELETE OVERFLY revision .

L2 OVERFLY REVISION AND SECONDARY FLIGHT PLAN

The OVERFLY revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

OVERFLY REVISION AND TEMPORARY FLIGHT PLAN

Creating, or deleting, an overfly creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-70-00003637.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The OVERFLY revision is the 7th revision in the waypoint revisions menu on the F-PLN page.

HOLD

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-80-00003620.0001001 / 03 SEP 14

PURPOSE

The flight crew uses the HOLD revision to:
- Insert a holding pattern in the flight plan
- Change an already existing holding pattern.

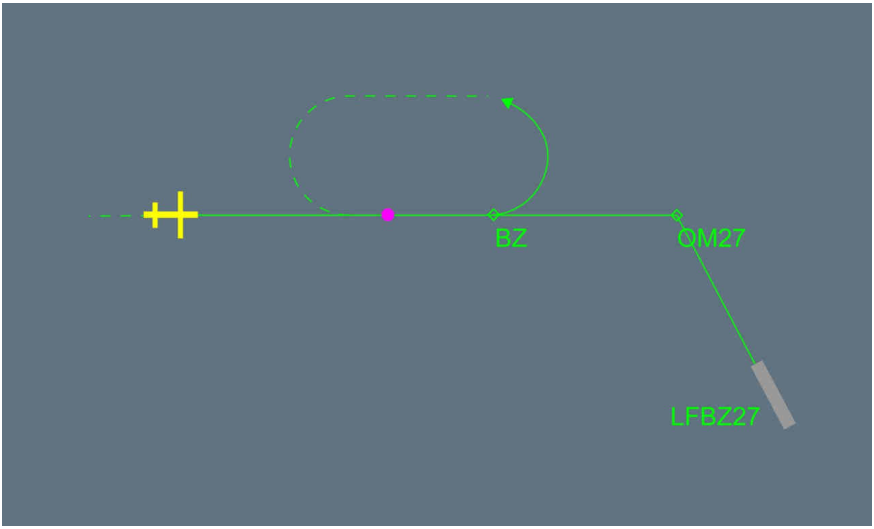
The FMS has three types of holding pattern, based on three different ways to exit the holding pattern:
- Holding Pattern to a Fixed Waypoint (HF)
- Holding Pattern to an Altitude Termination (HA)
- Holding Pattern with a Manual Termination (HM).

The HF and HA are always part of a departure or arrival procedure, and cannot be created by the flight crew. An HM can be part of an arrival procedure, or can be created by the flight crew at any waypoint of the flight plan.

Note: *The entry and exit waypoint of the holding pattern is referred to as the holding fix.*

HOLDING PATTERN TO A FIXED WAYPOINT (HF)

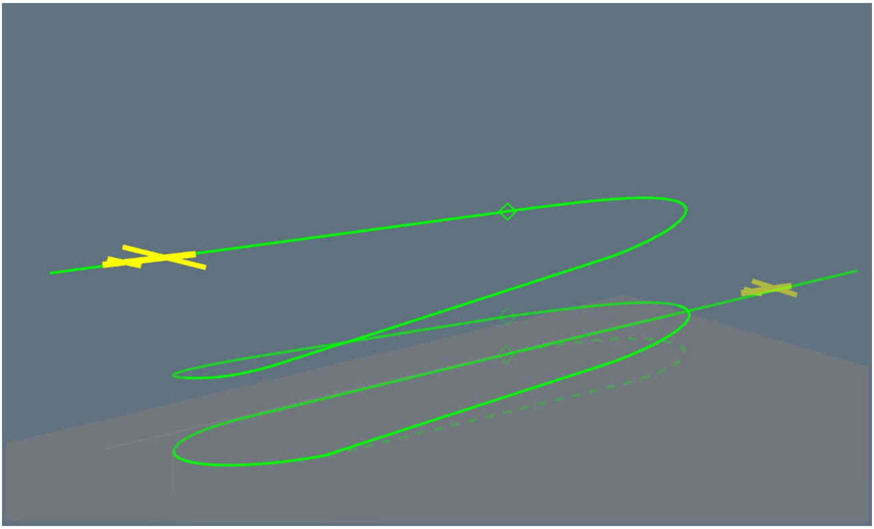
HF



The aircraft flies the holding pattern one time, and automatically exits the holding pattern at the holding fix.
The HF is part of a navigation database departure, or arrival procedure, and cannot be created by the flight crew.
The flight crew can remove the holding pattern from the flight plan, by deleting the holding fix.

HOLDING PATTERN TO AN ALTITUDE TERMINATION (HA)

HA



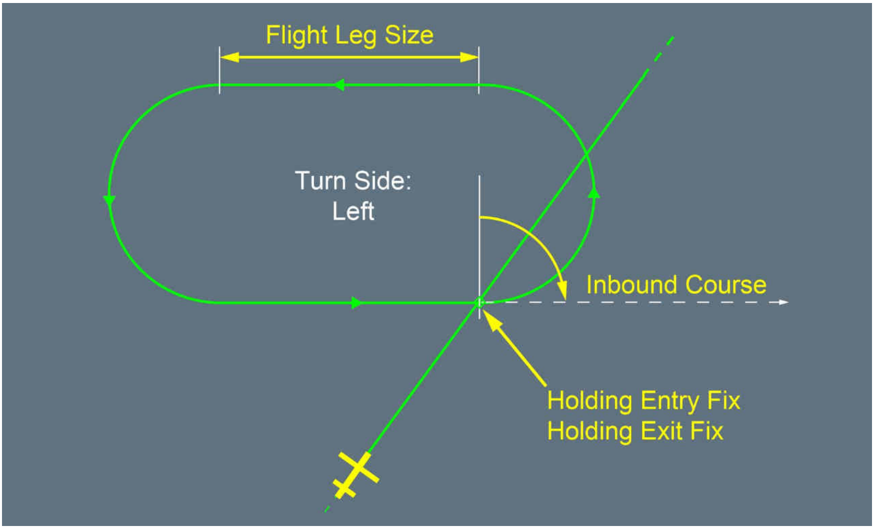
The aircraft flies the holding pattern, until the aircraft reaches the specified altitude. Then, the aircraft automatically exits the holding pattern at the holding fix.
The HA is part of a navigation database departure, or arrival procedure, and cannot be created by the flight crew.
The flight crew can remove the holding pattern from the flight plan, by deleting the holding fix.

HOLDING PATTERN WITH A MANUAL TERMINATION (HM)

The aircraft flies in the holding pattern, until the flight crew decides to exit.
The flight crew can manually enter an HM at P.POS, or at any waypoint of the flight plan to comply with a defined procedure, a clearance limit, or an operational need (e.g. it is necessary to lose altitude, to wait for better weather, or to wait due to an ATC delay).
An HM can also be part of a navigation database arrival procedure.
The flight crew can always change an HM.

The HM is defined by:
- The holding fix
- The inbound course
- The turn side
- The flight leg size (in time or distance).

HM



The flight crew inserts an HM in the flight plan, by performing a lateral revision on the flight plan waypoint, where the holding pattern should start. The revised waypoint becomes the holding fix. To insert an HM at P.POS, the flight crew performs the lateral revision on the flight plan FROM waypoint.
The flight crew can insert three different types of HM:

Database Holding Pattern

The FMS navigation database may have an HM that is associated with the revised waypoint. The inbound course, turn side, and flight leg size are taken from the navigation database.

Computed Holding Pattern

The FMS automatically creates a holding pattern that is associated with the revised waypoint, and displays the parameters of this holding pattern for selection by the flight crew.

L2 This computed holding pattern has the following parameters:

- Inbound course:
  - The track of the flight leg that comes before the holding fix, or
  - The aircraft bearing, if the holding fix is P.POS
- Turn side: Right
- Flight leg size:
  - 1 min, if the predicted aircraft altitude at the holding pattern is below or equal to 14 000 ft , or
  - 1.5 min, if the altitude is above 14 000 ft.

L1 Modified Holding Pattern

The flight crew can always change one or more parameters of a database or computed holding pattern. In this case, the HM is referred to as modified holding pattern.

PREDICTIONS AND GUIDANCE FOR HF AND HA

The FMS considers an HF or HA as a normal flight leg.

The predicted speed on the flight leg of the holding pattern is the lowest of:

- ICAO holding speed limit
- Maximum endurance speed
- Speed constraint or speed limit (if any)

  Note: *If a speed constraint is applicable to a HF flight leg, the FMS applies the speed constraint only at the end of the leg although the speed constraint should apply on the entire leg.*

- Navigation database holding speed.

Note: *The predicted speed is limited by the speed envelope.*

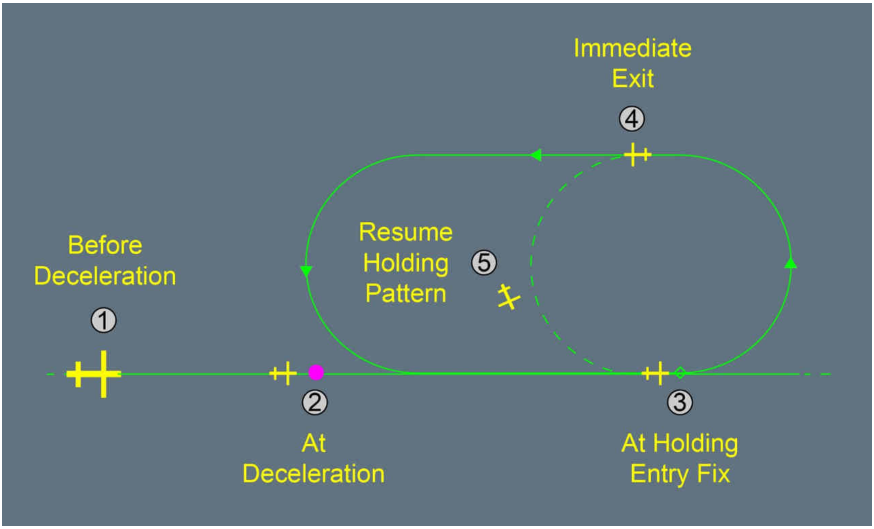
L3 When there is an HF in the arrival procedure, that is on the runway axis, and the aircraft is on the runway axis, and has the correct altitude, the flight crew may decide to engage the approach modes (LOC, G/S, F-LOC, F-G/S), without flying the holding pattern. In this case, the FMS still takes into account the holding pattern for the flight plan predictions. The result of this behavior is that the display on the VD and the PFD is not consistent. The PFD displays the guidance raw data. The VD displays the data along the predicted flight plan. As the holding pattern is still part of the predicted flight plan, the VD distance between the aircraft current position and the destination airport (and FLS beam, if any) is more than the distance that the aircraft will really fly. In this specific case, the flight crew should monitor the PFD deviations, and disregard the VD flight plan data.
When the aircraft sequences the holding fix, the FMS updates the predictions: The holding pattern is no longer part of the predicted flight plan. The PFD and the VD are consistent.

L1

PREDICTIONS AND GUIDANCE FOR HM

The predictions and guidance for an HM depend on the position of the aircraft in the holding pattern, and on the following flight crew actions:

HM



Before Deceleration

Although the holding pattern is inserted in the flight plan, the FMS does not take it into account for predictions.
However, the FMS schedules a deceleration point and displays it on the ND and VD.
If the ND range is 80 NM or less, the ND displays the holding pattern and the entry trajectory, when the aircraft sequences the waypoint that comes before the holding fix, or when the aircraft is at deceleration point.
When the flight leg parameter of the holding pattern is a time (and not a distance), the FMS computes the holding pattern size based on the predicted holding speed.

The predicted holding speed is the lowest of:
- ICAO holding speed limit
- Maximum endurance speed
- Speed constraint or speed limit (if any)
- Navigation database holding speed.

Note: *The predicted speed is limited by the speed envelope.*

L2 When the selected speed/Mach control is engaged, the FMS computes the holding pattern size based on the selected holding speed.

L1 The FMS also predicts the estimated time and amount of fuel remaining at which the aircraft must exit the holding pattern, so as to comply with the fuel policy. The HOLD page displays these time and fuel estimations.

When Reaching the Deceleration Pseudo Waypoint

The FMS assumes that the aircraft will fly one loop of the holding pattern, and revises the predictions accordingly.
The aircraft decelerates to the holding speed.
The holding speed is the speed target that is sent to the flight guidance (PRIM). This may be the predicted holding speed (limited by the speed envelope), or a different target speed associated with a flaps setting when the aircraft is in the approach phase.
When the flight leg parameter of the holding pattern is a time (and not a distance), the FMS computes the holding pattern size based on the holding speed.

L2 When the selected speed control is active and the aircraft reaches the deceleration point, the MFD and the PFD display the SET HOLD SPD message (*Refer to message*).
When the selected speed control is active, the holding pattern size is based on the selected speed target.

L1 The flight crew can still decide not to fly the holding pattern, by using the IMMEDIATE EXIT button on the ACTIVE/F-PLN page.

After Reaching the Holding Fix

The aircraft enters the holding pattern.
When the flight leg parameter of the holding pattern is a time (and not a distance), the FMS revises the size of the holding pattern, based on the speed target at the holding entry fix. The holding pattern size is frozen during one loop, and is updated again at the next overfly of the holding entry fix.

L2 When the selected speed/Mach control is engaged, the revision of the holding pattern size is based on the selected speed target.

L1 Each time the aircraft flies over the holding fix, the FMS updates the predictions for one more holding loop.

Note: *When the aircraft flies on a holding pattern, the flight crew can make a revision of the holding pattern. This revision will create a temporary flight plan. The flight crew can check the new holding pattern in the temporary flight plan (on MFD and ND). When the flight crew inserts the temporary flight plan, the aircraft keeps on flying on the old holding pattern. Only when the aircraft sequences the holding fix, the FMS takes into account and displays the updated holding pattern.*

The flight crew decides to exit the holding pattern immediately

The flight crew clicks on the IMMEDIATE EXIT button on the ACTIVE/F-PLN page.
The FMS assumes that the aircraft will return immediately to the holding exit fix, and revises the predictions accordingly. The aircraft keeps the holding speed, until the aircraft reaches the holding exit fix.
When sequencing the holding fix, the aircraft exits the holding pattern, and resumes its navigation. The FMS sets the target speed to the applicable speed of the current flight phase.

The flight crew decides to resume the holding pattern

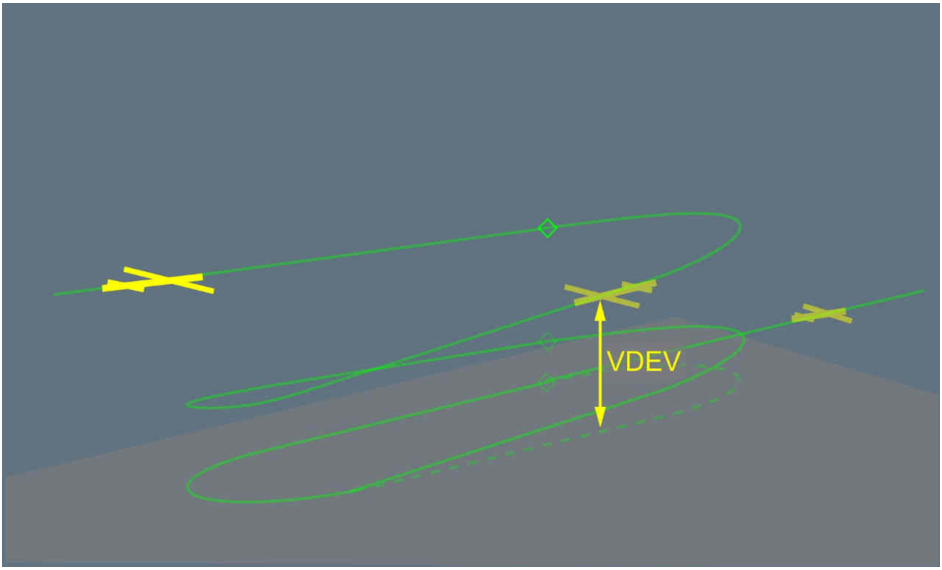
The flight crew clicks on the RESUME HOLD button on the ACTIVE/F-PLN page.
The aircraft intercepts the holding pattern, in accordance with the holding pattern entries logic (See Holding Pattern Entries).
Each time the aircraft flies over the holding fix, the FMS updates the predictions for one more holding loop.

HM and Descent

The following applies for a holding pattern in descent or approach:
- Before the deceleration pseudo waypoint, the FMS does not take into account the holding pattern for the descent path computation.
- When reaching the deceleration pseudo waypoint, the FMS computes the theoretical descent path backward from the destination airport up to the holding exit fix. The FMS does not compute a theoretical descent path inside the holding pattern.

- During descent and approach, the DES and APPR panels of the PERF page and the PFD display the vertical deviation. In the deceleration flight leg and in the holding pattern, the vertical deviation is the difference between the aircraft current altitude and the altitude at which the aircraft should be when it reaches the holding exit fix, in order to be correctly positioned on the theoretical descent path.

VDEV and Holding Pattern



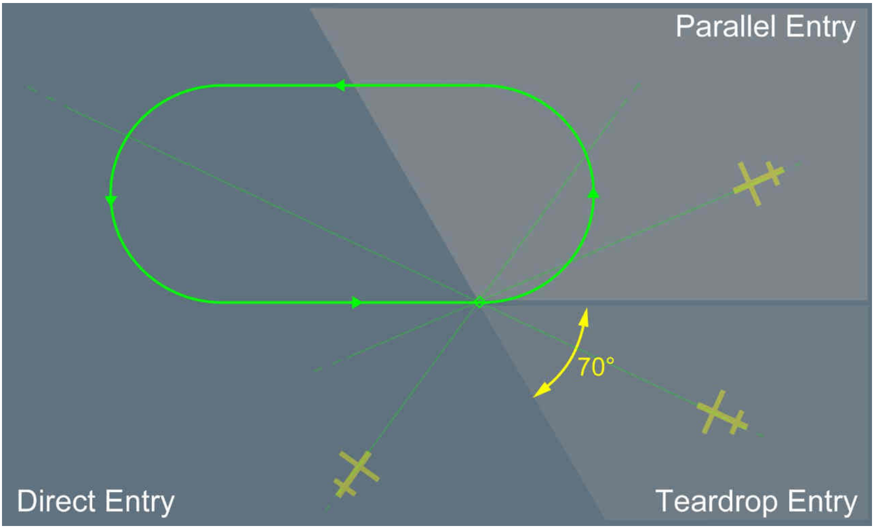
- The vertical guidance in the HM, during the descent phase, targets a descent rate of 1 000 ft/min. However, the FMS takes into account altitude constraints that will take effect down path the flight plan, so that during the holding pattern, the aircraft will not descend below the next altitude constraint. If the aircraft reaches the constraint altitude, it will level off and the ALT CST mode will engage.
- The flight crew cannot enter speed constraints at the holding exit fix (This is possible only at the holding entry fix).

HOLDING PATTERN ENTRIES

The way of entering a holding pattern depends on the difference of angle between the heading of the aircraft and the holding inbound course.

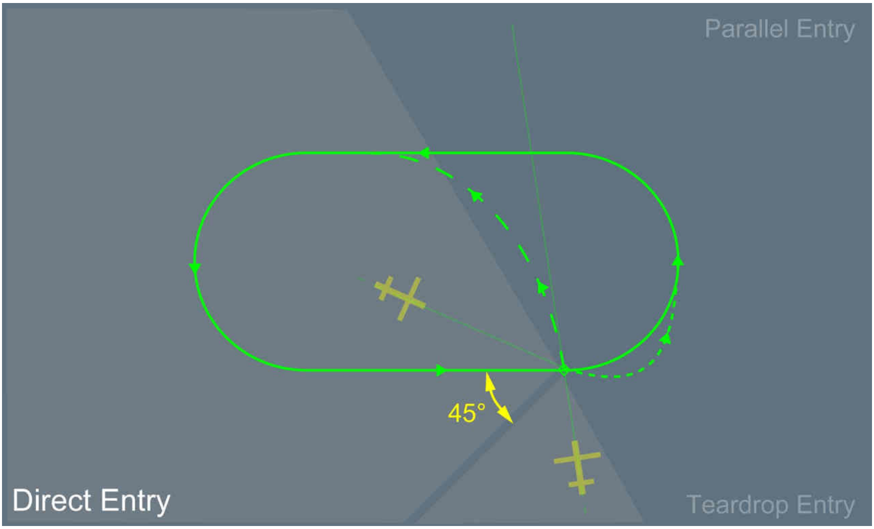
The FMS applies three holding pattern entries:
- The direct entry
- The teardrop entry
- The parallel entry.

Holding Pattern Entries



Parallel Entry
70°
Direct Entry
Teardrop Entry

Direct Entry



Parallel Entry
45°
Direct Entry

Teardrop Entry

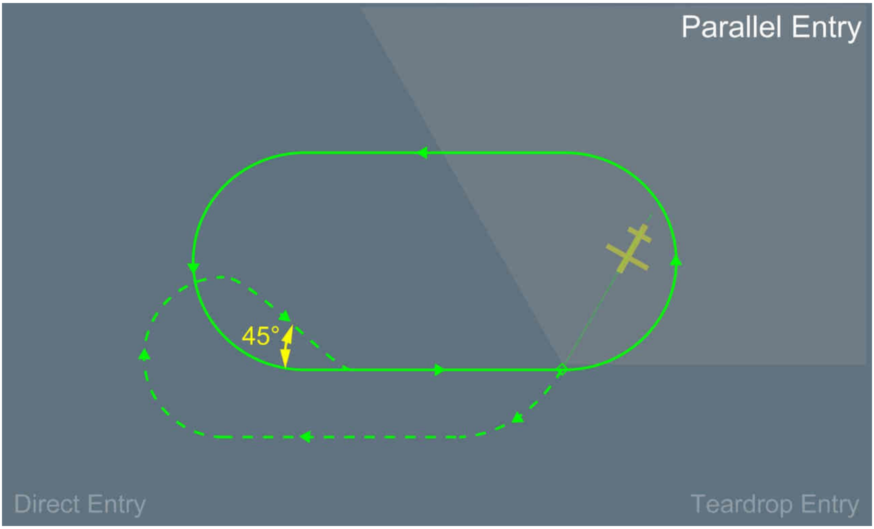
Parallel Entry
30°
45°
Direct Entry
Teardrop Entry

Parallel Entry



Note: *Specific case: If the flight leg toward the holding entry fix has the opposite course of the holding inbound course, the aircraft will fly a parallel entry.*

L2 HOLD REVISION AND SECONDARY FLIGHT PLAN

The HOLD revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

HOLD REVISION AND TEMPORARY FLIGHT PLAN

The insertion of a holding pattern, or a change of an existing holding pattern, creates a temporary flight plan.

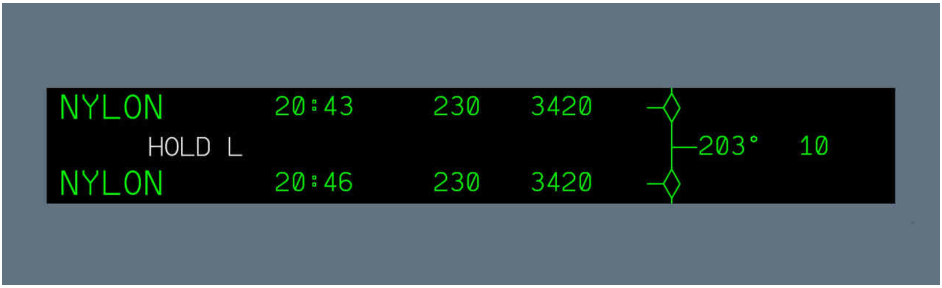
CONTROLS AND INDICATORS

ON THE MFD

On the F-PLN page, the different types of holding pattern are indicated as follows:

- Holding Pattern to a Fixed Waypoint (HF)

HF

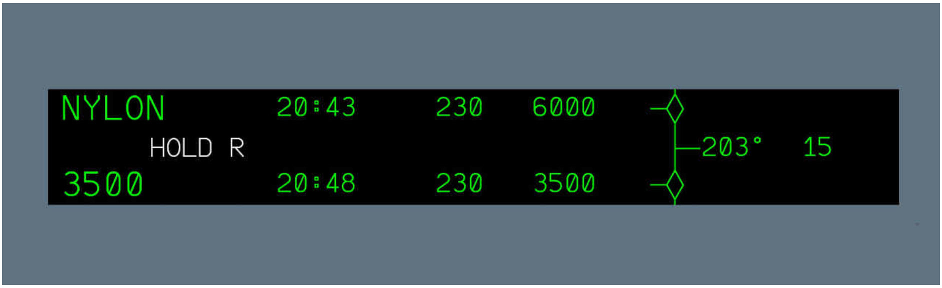


```
NYLON        20:43     230    3420
      HOLD L                          203°   10
NYLON        20:46     230    3420
```

The flight plan displays the holding entry fix and the holding exit fix on two lines. The HOLD L label or HOLD R label, between the holding fix lines, indicates the turn side.
The flight crew can remove the HF from the flight plan, by deleting the holding fix.

- Holding Pattern to an Altitude Termination (HA)

HA

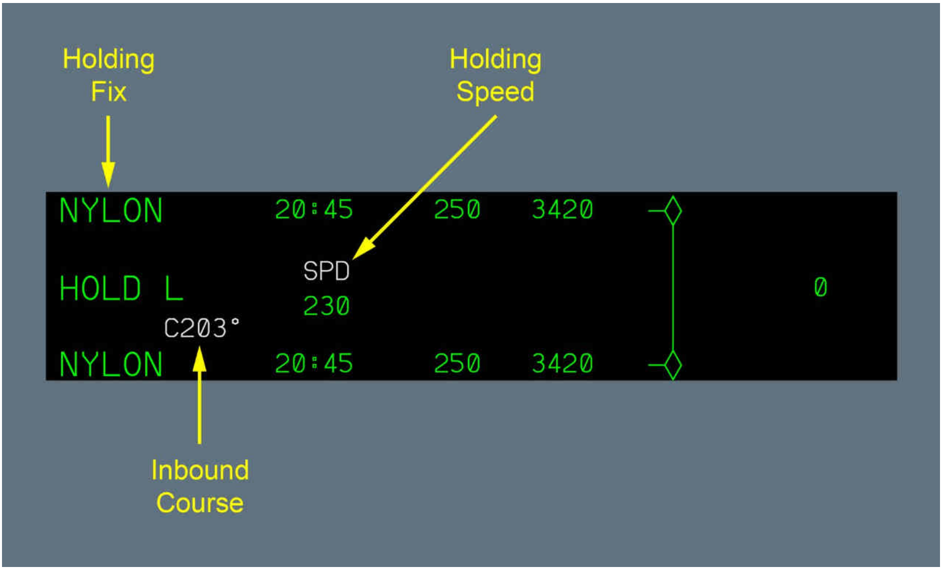


```
NYLON        20:43     230    6000
      HOLD R                          203°   15
3500         20:48     230    3500
```

The flight plan displays the holding entry fix on one line, and the exit altitude on another line. The HOLD L label or HOLD R label, between the holding fix line and the altitude line, indicates the turn side.
The flight crew can remove the HA from the flight plan, by deleting the holding fix.

- Holding Pattern with a Manual Termination (HM)

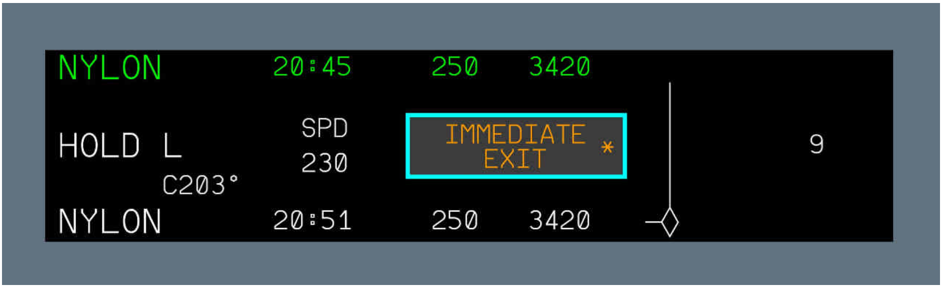
HM



Holding Fix
Holding Speed
NYLON 20:45 250 3420
HOLD L
SPD
230
C203°
0
NYLON 20:45 250 3420
Inbound Course

The flight plan displays the holding entry fix and the holding exit fix on two lines. The HOLD L label or HOLD R label (that indicates the turn side), and the SPD label (that indicates the holding managed or selected speed), are displayed on a line between the two holding fix lines. The inbound course is displayed between HOLD L(R) line and the holding exit fix line.
The flight crew can remove the HM from the flight plan, by deleting the holding fix.
After sequencing the holding deceleration point, the flight plan displays the IMMEDIATE EXIT button. The flight crew can use this button to delete the holding pattern, before sequencing the holding entry fix, or to immediately exit the holding pattern when flying it.

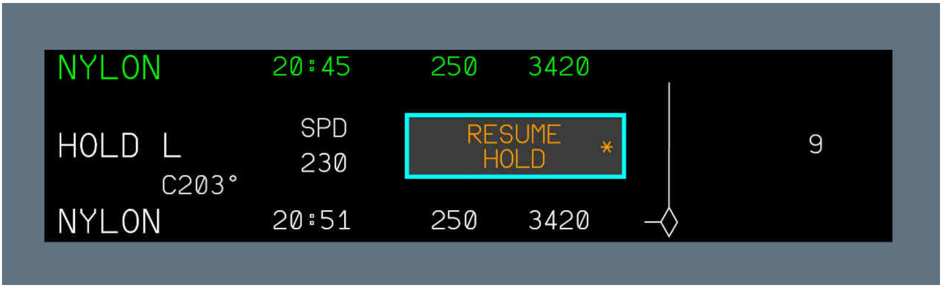
IMMEDIATE EXIT Button



NYLON 20:45 250 3420
HOLD L
SPD
230
IMMEDIATE EXIT *
9
C203°
NYLON 20:51 250 3420

The flight crew can resume the holding pattern, that was initially planned, by using the RESUME HOLD button. The F-PLN page displays this button, until the holding fix is sequenced.

RESUME HOLD Button



```
NYLON        20:45     250   3420

HOLD L        SPD     RESUME  *             9
               230     HOLD
      C203°
NYLON        20:51     250   3420
```

The flight crew can enter or modify an HM on the HOLD page.

For more information about the HOLD page , *Refer to DSC-22-FMS-20-20-20 HOLD Page*.
The flight crew can access the HOLD page via the F-PLN page, by selecting the HOLD revision in the waypoint revisions menu.

L2 When the aircraft flies an HM, the DES panel of PERF page displays the Vertical Deviation (VDEV). The VDEV is the difference between the aircraft current altitude and the altitude at which the aircraft should be when it reaches the holding exit fix. The PFD also displays this parameter.

L1 ON THE ND

The ND displays the entire holding pattern and its entry trajectory, only when all of the following occur:
- The ND range is 80 NM or less
- The aircraft sequenced the waypoint that comes before the holding entry fix, or the aircraft is after the holding deceleration point.

In all other cases, the ND displays the holding pattern symbol.

L2 ON THE PFD

When the aircraft flies on an HM, the PFD displays the vertical deviation. The vertical deviation is the difference between the aircraft current altitude and the altitude at which the aircraft should be when it reaches the holding exit fix. The DES panel of the PERF page also displays this parameter.

Ident.: DSC-22-FMS-10-40-20-80-00003632.0001001 / 14 APR 14

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following messages:
- SET HOLD SPD (*Refer to message*)
- TIME TO EXIT (*Refer to message*).

AIRWAYS

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-90-00003607.0001001 / 14 APR 14

PURPOSE

The flight crew uses the AIRWAYS revision to insert airway segments in the flight plan.

Each airway segment is defined by:

- The start waypoint

  L2 For the first segment, the start waypoint is the revised flight plan waypoint. For any other segment, the start waypoint is the end waypoint of the previous segment.

- L1 The airway

  L2 All airways are included in the navigation database. The flight crew can select the airway by entering the ident of the airway.

- L1 The end waypoint.

  The end waypoint can be defined either manually or automatically:

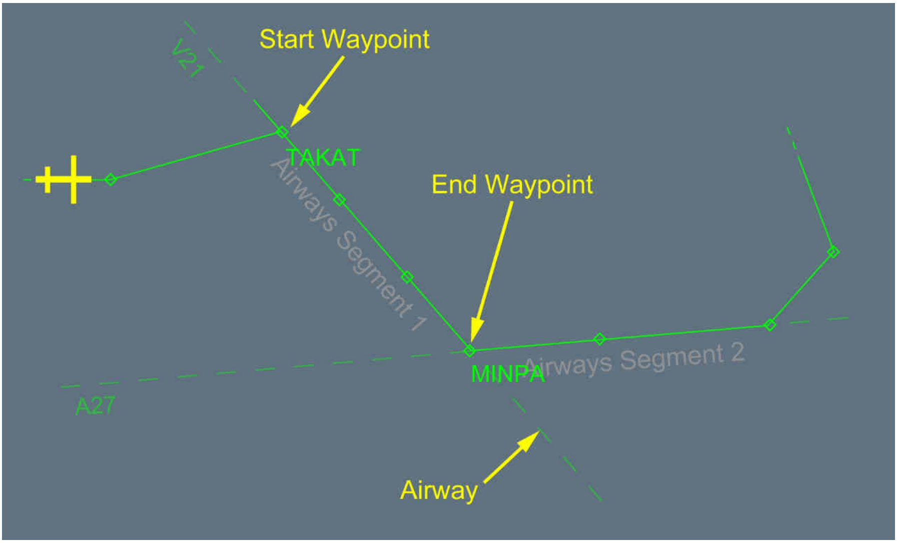
  - Manually
    The flight crew can enter the ident of the end waypoint in the associated entry field.

    Note: The flight crew can enter any waypoint, if it belongs to the defined airway. If not, the AIRWAY / WPT DISAGREE message is displayed.

  - Automatically
    The flight crew can enter two airways of two consecutive segments. Then, the FMS searches the common waypoint or computes the geographic intersection of both airways, and defines it as the end waypoint of the first segment.

    Note: If the FMS does neither find a common waypoint nor geographic intersection for the two defined airways, the NO INTERSECTION FOUND message is displayed.

Airway Segments



L2 The airway segments are inserted in the flight plan, starting with the revised waypoint, and ending with the end waypoint of the last segment. If the end waypoint is part of the original flight plan (i.e. the flight plan before the revision), all waypoints and flight legs of the original flight plan, that are up-path the end waypoint, are deleted.

If the end waypoint is not part of the original flight plan, a discontinuity will be inserted between the end waypoint and the first waypoint of the original flight plan, down-path the revised waypoint.

When inserted in the flight plan, the airway segments are considered as normal flight plan waypoints and flight legs, with their associated flight plan revisions.

FIXED TURN RADIUS AIRWAYS

An airway can have a constant turn radius defined for one or more waypoints. The FMS uses this turn radius to compute the transition between the two flight legs at the specific waypoint.

L3 The turn radius is not taken into account, if:

- The waypoint is the start waypoint of the first airway segment, or the end waypoint of the last airway segment
- The flight crew inserts an overfly at the waypoint
- The flight crew performs DIR TO - CRS IN(OUT) to the waypoint
- The waypoint is part of an offset capture or return path.

L2 AIRWAYS REVISION AND SECONDARY FLIGHT PLAN

The AIRWAYS revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

AIRWAYS REVISION AND TEMPORARY FLIGHT PLAN

Inserting, changing, or removing airways segments creates a temporary flight plan. The entry of several airway segments is considered as a single lateral revision.

Note: *If an airways entry is in progress, the flight crew cannot perform another flight plan revision at the same time. The AIRWAYS INSERTION IN PROGRESS: F-PLN REVISION NOT ALLOWED message is displayed, when the flight crew tries to access a revision.*

Ident.: DSC-22-FMS-10-40-20-90-00003634.0001001 / 14 APR 14

ON THE ND

The airway segments are considered as normal flight plan waypoints and flight legs. On the ND, no special symbology is used to indicate the airway segments.

Ident.: DSC-22-FMS-10-40-20-90-00003635.0001001 / 14 APR 14

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following messages:
- AIRWAY / WPT DISAGREE (*Refer to message*)
- AIRWAYS INSERTION IN PROGRESS F-PLN REVISION NOT ALLOWED (*Refer to message*)
- NO INTERSECTION FOUND (*Refer to message*).

ENABLE ALTN

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-100-00003609.0001001 / 14 APR 14

PURPOSE

The flight crew uses the ENABLE ALTN revision to initiate a diversion. The ENABLE ALTN revision activates the alternate flight plan.
After the flight crew activates the alternate flight plan, the FMS deletes all waypoints of the destination flight plan beyond the revised waypoint (including the destination airport and the missed approach), and connects the revised waypoint to the first waypoint of the alternate flight plan with a discontinuity.

ENABLE ALTN Revision

EHAM06
Destination Airport
LEKKO
Alternate Airport
Alternate Flight Plan
EDDF07L
EEL
NOVEN
F-PLN DISCONTINUITY
ARTIP
LEKKO
EDDF07L

L2 The flight crew can activate the alternate flight plan from a waypoint of the destination flight plan, including the flight plan discontinuities.

Note: The flight crew cannot enable the alternate flight plan from a waypoint or airport of the alternate flight plan.

L3 If the revised waypoint is the destination airport, the destination airport becomes a flight plan waypoint, and a discontinuity is inserted between the destination airport and the first waypoint of the alternate flight plan.

If the new destination airport (the former alternate airport) is the same as the previous destination airport, the following parameters remain the same:
- Go-around thrust reduction and acceleration altitudes
- Descent transition altitudes
- Descent speed limit
- Descent winds (not the alternate wind)
- Destination QNH, temperature, wind and landing configuration.

L2

ENABLE ALTN REVISION AND SECONDARY FLIGHT PLAN

The ENABLE ALTN revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

ENABLE ALTN REVISION AND TEMPORARY FLIGHT PLAN

Enabling the alternate flight plan creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-100-00003639.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

NEW DEST

Applicable to: ALL

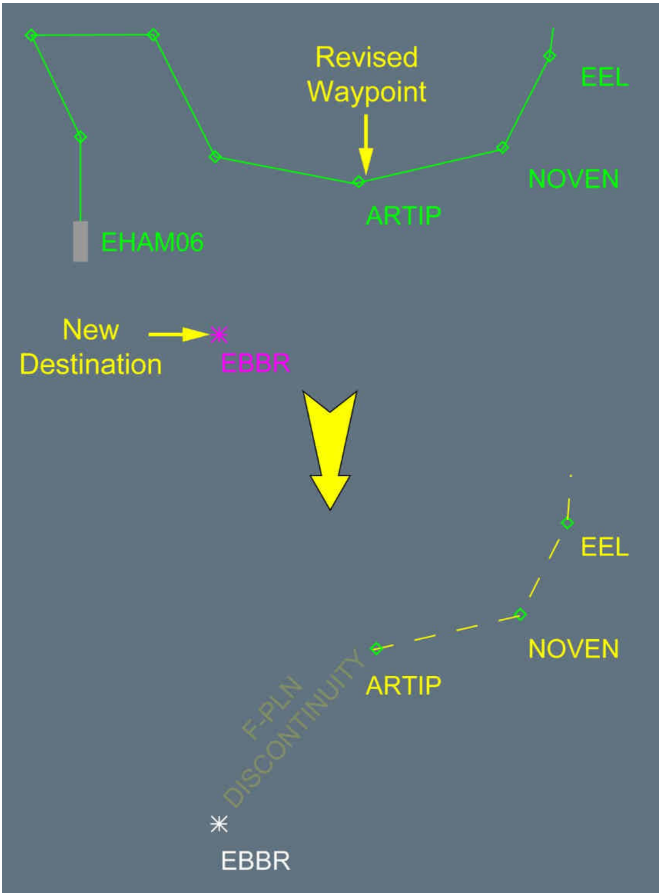
Ident.: DSC-22-FMS-10-40-20-110-00003610.0001001 / 14 APR 14

PURPOSE

The flight crew uses the NEW DEST revision to define a new destination airport.

The insertion of a new destination deletes all waypoints of the flight plan between the revised waypoint and the new destination airport, and inserts a flight plan discontinuity in their place.

NEW DEST Revision



Revised
Waypoint

F-PLN
DISCONTINUITY
EBBR

L2 After a new destination entry, the alternate flight plan associated with the new destination replaces the old one if it is different.

The flight crew can insert a new destination airport from any waypoint or discontinuity of the destination flight plan (including the departure and destination airports), except:
- From the FROM (or P.POS) waypoint in flight
- From a manual flight leg
- From a flight leg that does not end at a fixed waypoint.

L3 If the revised waypoint is the destination airport, the destination airport becomes a flight plan waypoint, and a discontinuity is inserted between the old and new destination airports.

L2 NEW DEST REVISION AND SECONDARY FLIGHT PLAN

The NEW DEST revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

NEW DEST REVISION AND TEMPORARY FLIGHT PLAN

The insertion of a new destination creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-110-00003641.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The NEW DEST revision is the 12th revision in the waypoint revisions menu on the F-PLN page.

ALTERNATE

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-120-00003611.0001001 / 14 APR 14

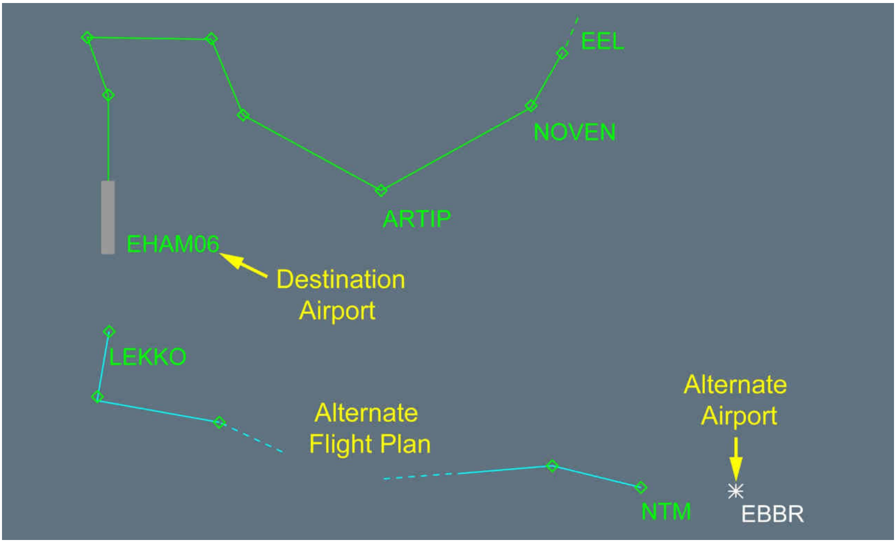
PURPOSE

The flight crew uses the ALTERNATE revision to insert, change, or remove the alternate airport. Associated with the destination airport, the navigation database may have a list of alternate airports (maximum 6) and corresponding company alternate routes. One of the alternate airports is marked, by the Operator, as the preferred one.

Note: *Some airports do not have associated alternate airports in the navigation database.*

When the flight crew enters a city-pair (FROM/TO airports) or a company route, the FMS completes the destination flight plan with the preferred alternate airport and the corresponding company alternate route.
If the navigation database has no company route between the destination airport and the alternate airport, the alternate route will be a direct route (indicated by a flight plan discontinuity) between the destination airport and the alternate airport.

Alternate Airport and Alternate Flight Plan



At any time, the flight crew can display the list of the alternate airports that are associated with the current destination airport, and can designate any of the airports in the list as the alternate airport.

The flight crew can also designate any other airport, that is not in the alternate list, as the alternate airport.

L2 ALTERNATE LIST INFORMATION AND PREDICTIONS

The FMS provides the following information, for each alternate airport in the navigation database alternate list:

- The company alternate route between the destination airport and the alternate airport, if there is one
- The distance between the destination airport and the alternate airport, along the company route, or the direct distance if there is no company route
- The great circle track between the destination airport and the alternate airport
- The estimated extra fuel at the alternate airport.

This information helps the flight crew to compare the alternate airports and to change the alternate airport, if necessary.
As soon as the flight crew inserts the alternate airport and the alternate flight plan, the FMS compute the predictions for the alternate flight plan. For more information, *Refer to DSC-22-FMS-10-40-70 Predictions for the Alternate Flight Plan*.

ALTERNATE REVISION AND SECONDARY FLIGHT PLAN

The alternate revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

ALTERNATE REVISION AND TEMPORARY FLIGHT PLAN

Inserting, changing, or removing the alternate airport creates a temporary flight plan.

Note: *Inserting, changing, or removing the alternate airport (and alternate flight plan) on the INIT page does not create a temporary flight plan.*

L1 ENABLE ALTN

The flight crew activates the alternate flight plan by using the ENABLE ALTN revision.
For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-22-FMS-10-40-20-120-00003643.0002001 / 14 APR 16

CONTROLS AND INDICATORS

ON THE MFD

During the flight plan initialization, the flight crew can check, enter, and change the alternate airport and the company alternate route on the INIT page.

Note: *The FMS does not create a temporary flight plan, when the flight crew enters or changes the alternate airport or the company alternate route via the INIT page.*

FIX INFO

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-130-00003612.0001001 / 03 JAN 20

PURPOSE

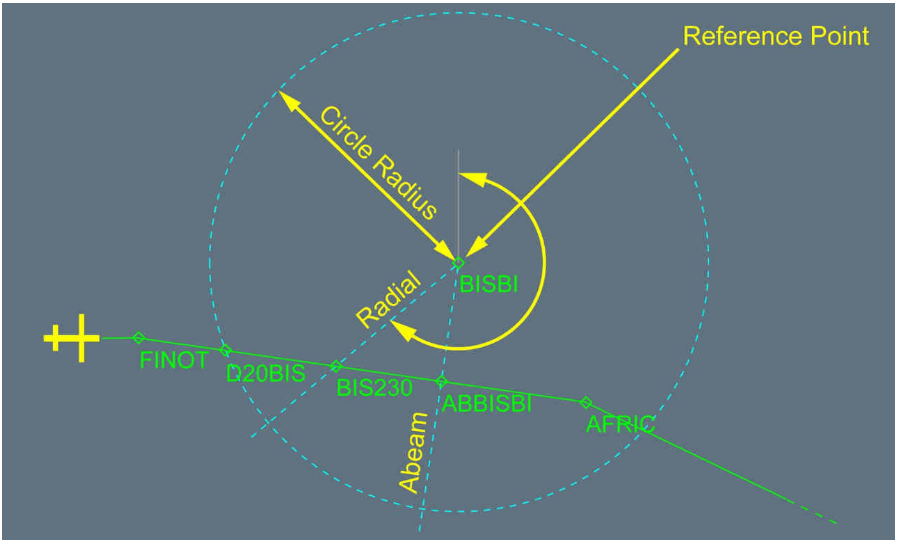
The flight crew uses the FIX INFO revision to compute the intersection of the flight plan and:

- A radial from a specified reference point, and/or
- A circle with a specified reference point as center, and/or

Note: The FMS searches only for the first intersection down-path the flight plan.

- The abeam line from a specified reference point.

FIX INFO Revision



L2 The reference point, also referred to as reference fix, can be a navigation database or pilot-stored waypoint, navaid, airport or runway.

L1 The FMS computes the following predictions for each intersection:

- Time of arrival
- Distance from P.POS
- Altitude.

INSERTION OF THE INTERSECTION IN THE FLIGHT PLAN

The flight crew can insert the computed intersections in the flight plan.

L2 The fix information waypoints are part of the flight plan, but are not stored in the pilot-stored elements database. This means that the fix information waypoints can be used for every flight plan revision (except AIRWAYS), until they are sequenced. As soon as they are sequenced, they are no longer memorized by the FMS.

Note: *The FIX INFO revision can also be used for display purposes only (without flight plan changes). The reference point and selected radial, circle or abeam are highlighted on the ND, as soon as they are computed, whether an intersection with the flight plan is found or not.*
FIX INFO RADIUS with a large radius more than 300 NM, may not appear correctly on the ND. For more information Refer to Abnormal Operations section.

FIX INFO REVISION AND SECONDARY FLIGHT PLAN

The FIX INFO revision is available only for the active (or temporary) flight plan.
Intersections are created only in the destination flight plan of the active flight plan.

FIX INFO REVISION AND TEMPORARY FLIGHT PLAN

Insertion of a fix information waypoint creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-130-00003645.0001001 / 27 FEB 17

CONTROLS AND INDICATORS

For more information about the FIX INFO page, *Refer to DSC-22-FMS-20-20-20 FIX INFO Page*.
The flight crew can access the FIX INFO page via the F-PLN page, by selecting the FIX INFO revision in the F-PLN INFO menu.

L3 The created intersections may be inserted in the flight plan. The fix information waypoints appear with the following ident:

- Intersection with radial: YYYNNN, where YYY are the first three characters of the reference fix, and NNN the radial (e.g. SUB330)
- Intersection with circle: DNNNYYY, where NNN is the radius of the circle (in nm), and YYY the first three characters of the reference fix (e.g. D70BIS)
- Abeam intersection: ABYYYYY, where YYYYY are the first five characters of the reference fix (e.g. ABBISBI).

ON THE ND

The designated reference point(s) are highlighted on the ND.

The selected radial(s) and circle(s) are also highlighted on the ND, whether an intersection with the flight plan is found or not.
The abeam radial is highlighted on the ND, only if an abeam point is found.
Radials, circles, and abeam radials are no longer displayed on the ND, if their associated intersection is inserted in the flight plan, or if their entry field is cleared.

LL CROSSING

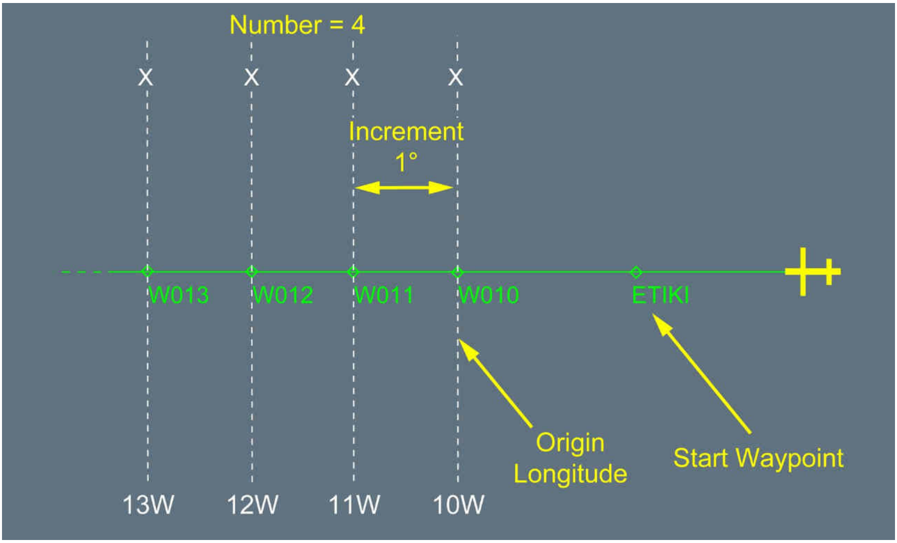
Applicable to: ALL

Ident.: DSC-22-FMS-10-40-20-140-00003613.0001001 / 14 APR 14

PURPOSE

The flight crew uses the LL CROSSING revision to insert a waypoint or a series of waypoints along the flight plan, defined by the intersection(s) of the flight plan with a series of latitudes or longitudes. The flight crew defines the series of waypoints, by entering:
- The start waypoint
- The origin latitude or longitude
- The latitude or longitude increment
- The maximum number of intersections.

LL CROSSING Revision



L2 No intersections are created beyond the last en-route waypoint.

L3 The latitude/longitude crossing waypoints are part of the flight plan, but are not stored in the pilot-stored elements database. This means that the latitude/longitude crossing waypoints can be used for every flight plan revision (except AIRWAYS), until they are sequenced. As soon as they are sequenced, they are no longer memorized by the FMS.

L2 LL CROSSING REVISION AND SECONDARY FLIGHT PLAN

The LL CROSSING revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

LL CROSSING REVISION AND TEMPORARY FLIGHT PLAN

Insertion of a latitude/longitude crossing waypoint, or series of waypoints, creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-20-140-00003647.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can create and insert latitude/longitude crossing waypoints on the LL XING page.

For more information about the LL XING page, *Refer to DSC-22-FMS-20-20-20 LL XING Page*. The flight crew can access the LL XING page via the F-PLN page by selecting the LL CROSSING revision in the F-PLN INFO menu.

The created intersections are inserted in the flight plan, with the following ident:
- NXX or SXX for latitude crossings (e.g. N75)
- EXXX or WXXX for longitude crossings (e.g. W125).

Ident.: DSC-22-FMS-10-40-20-140-00003648.0001001 / 14 APR 14

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following message: NO INTERSECTION FOUND (*Refer to message*).

Vertical Revisions

OVERVIEW

Ident.: DSC-22-FMS-10-40-30-00004409.0001001 / 14 APR 14
Applicable to: ALL

A change to the vertical flight plan is referred to as a vertical revision.
The flight plan waypoint from which a vertical revision applies is referred to as the revised waypoint.

The flight crew can access all vertical revisions via the F-PLN page on the MFD, by:
- Clicking on the time, speed, altitude, or wind prediction of the revised waypoint, or
- Via the waypoint revisions menu of the revised waypoint.

Note: *The flight crew can also access the WIND revision via the ACTIVE menu of the general menu bar.*

ACCESS VIA THE WAYPOINT PREDICTIONS

Via the waypoint predictions, the flight crew can access the following vertical revisions:
- The time prediction provides access to the time constraint revision
- The speed prediction provides access to the Speed Constraint (SPD CSTR) revision and Speed Limit (SPD LIMIT) revision, or to the Constant Mach Segment (CMS) revision, depending on the flight phase to which the revised waypoint belongs
- The altitude prediction provides access to the Altitude Constraint (ALT CSTR) revision, or Step Altitudes (STEP ALTs) revision, depending on the flight phase to which the revised waypoint belongs
- The wind prediction provides access to the WIND revision.

TIME CONSTRAINT (RTA)

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-30-10-00004410.0001001 / 14 APR 14

PURPOSE

The flight crew uses the time constraint revision to:

- Enter, change, or delete a Required Time of Arrival (RTA) at a waypoint
- Enter or change the Estimated Takeoff Time (ETT).

REQUIRED TIME OF ARRIVAL (RTA)

The RTA is a time constraint that must be respected at the revised waypoint.
The constraint can be to reach the waypoint AT, AT OR BEFORE, or AT OR AFTER the entered RTA.

L2 The flight crew can define an RTA at all waypoints of the destination flight plan (including the destination airport), except at the departure airport, the FROM waypoint, and the missed approach waypoints.
There can be only one RTA per flight plan. If there is already an RTA in the flight plan and the flight crew enters a new RTA on a different waypoint, the previous RTA is deleted, and the new one is taken into account.

L3 It is not possible to insert an RTA, or the existing RTA is not taken into account, if:

- The Engine-Out (EO) mode is active
- The UTC time is not valid
- The aircraft is in a holding pattern with manual termination, or in the deceleration zone of this holding pattern
- The flight phase is CRZ and the aircraft is closer than 40 NM from the T/D
- The flight phase is DES, APPR, or GA.

Automatic Deletion of the RTA

The existing RTA is automatically deleted, with the associated FMS message RTA DELETED, if one of the following occurs:

- The Engine-Out (EO) mode becomes active
- The UTC time is no longer valid
- The aircraft enters a holding pattern with manual termination, or the deceleration zone of this holding pattern
- The flight phase transitions from DES or APPR, to CLB or CRZ
- The flight phase becomes GA.

The existing RTA is automatically deleted, with no associated FMS message, if one of the following occurs:

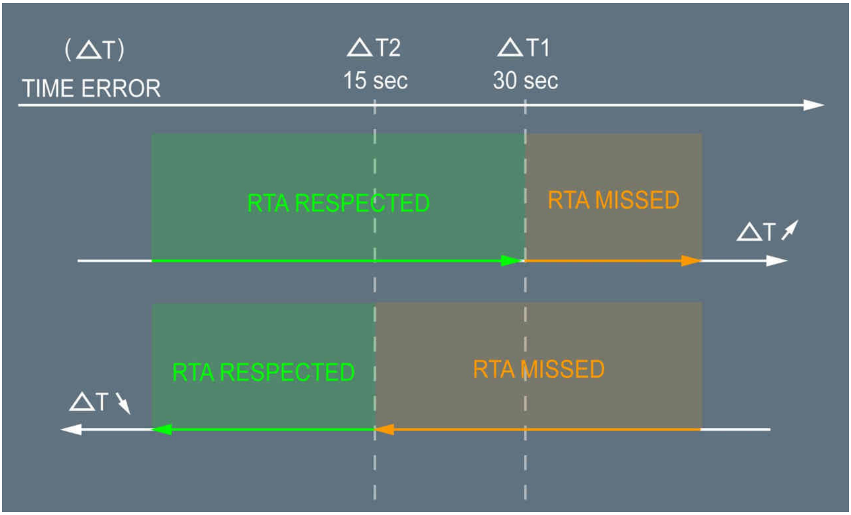
- A second RTA is entered in the flight plan
- The alternate flight plan is enabled
- The waypoint with the time constraint becomes an ABEAM waypoint, when a DIRECT WITH ABEAM is performed.

L1 Time Error

The FMS compares the RTA with the Estimated Time of Arrival (ETA) at the waypoint, and predicts whether the time constraint will be respected or missed. The difference between the RTA and the ETA is referred to as the time error.

The time constraint is predicted as missed, if the time error is more than 30 s. When missed, the time constraint remains missed as long as the time error is more than 15 s.

Time Error



L3 *Note:* *ΔT1 and ΔT2 are respectively 30 s and 15 s, if the distance between the aircraft and the revised waypoint is less than 2 000 NM.*
If the distance is more than 2 000 NM, ΔT1 and ΔT2 linearly increase at a rate of 60 s per 1 000 NM.

L1 When the time constraint is missed, the FMS displays the TIME ERROR AT XXXXXXX message on the MFD, with XXXXXXX the ident of the waypoint with the time constraint.

ESTIMATED TAKEOFF TIME (ETT)

The ETT is the time reference used for flight plan predictions in the PREFLIGHT flight phase. At transition to the T.O flight phase, the predictions are based on the current aircraft time.

The ETT may be (in the following order of priority):

- A flight crew entry
- An FMS computed value:
  The FMS computes an ETT, when there is an RTA in the flight plan. The default ETT is updated after each flight plan revision.

L2 *Note:* *There is an automatically computed ETT, when the necessary flight time from the departure airport to the constrained waypoint is less than the available time between the current aircraft time and the RTA.*

The flight crew can clear the manually entered ETT at any time. However, the automatically computed ETT can only be cleared by deleting the associated RTA.
When the flight crew changes the departure airport, the ETT is cleared automatically.
L1 If the UTC time reaches the ETT, or at transition to the T.O flight phase, the ETT becomes the UTC time.

L3 The ETT can only be defined, if:

- The flight phase is PREFLIGHT
- The UTC time is valid.

L2 TIME CONSTRAINT REVISION AND SECONDARY FLIGHT PLAN

The time constraint revision (RTA and ETT) is available for the active (or temporary) flight plan, and for the secondary flight plans.

TIME CONSTRAINT REVISION AND TEMPORARY FLIGHT PLAN

Insertion, change, or deletion of an RTA, or ETT, creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-30-10-00004417.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete the RTA and ETT on the RTA panel of the VERT REV page.

For more information about the RTA panel of the VERT REV page, *Refer to DSC-22-FMS-20-20-20 VERT REV Page*.

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the time prediction associated with the revised waypoint, or by selecting the CONSTRAINTS revision in the waypoint revisions menu.

On the F-PLN page:
- The time constraint on a waypoint is indicated by a star to the left of the waypoint time prediction. The color of the star is magenta, if the time constraint will be respected, or amber, if the constraint will be missed
- During the PREFLIGHT phase, the ETT is displayed in magenta in the time prediction column of the FROM waypoint.

For more information about the F-PLN page, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

ON THE ND

On the upper part of the ND, the time constraint value is displayed under the waypoint ident, when the CONSTRAINTS option is selected on the EFIS CP. The color of the constraint is magenta, if the time constraint will be respected, or amber, if the time constraint will be missed. The time constraint is not indicated on the VD.

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following messages:
- ADJUSTING SPD DUE TO RTA (*Refer to message*)
- RTA ALREADY EXISTS (*Refer to message*)
- RTA DELETED (*Refer to message*)
- RTA NOT CONSIDERED FOR FUEL PLANNING (*Refer to message*)
- TIME ERROR AT XXXXXXX (*Refer to message*)
- T.O TIME REACHED (*Refer to message*).

SPD CSTR

Applicable to: ALL

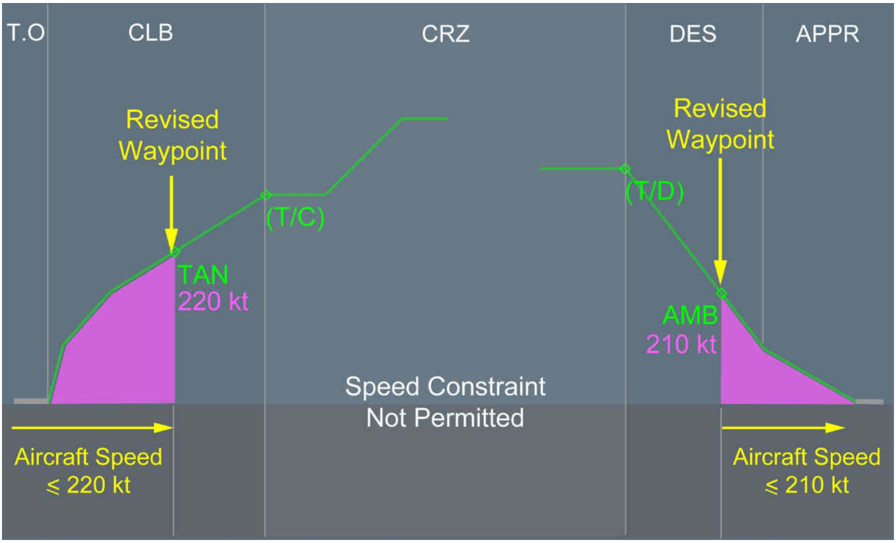
Ident.: DSC-22-FMS-10-40-30-20-00004411.0001001 / 14 APR 14

PURPOSE

The flight crew uses the SPD CSTR revision to enter, change, or delete a speed constraint at a waypoint.

There may be speed constraints for the CLB and the DES flight phases:
- For a climb speed constraint, the aircraft must fly at or below the specified speed, from the departure airport up to the speed constraint waypoint
- For a descent speed constraint, the aircraft must fly at or below the specified speed, from the speed constraint down to the destination airport.

Speed Constraint



T.O
CLB
CRZ
DES
APPR
Revised Waypoint
(T/C)
(T/D)
Revised Waypoint
TAN
220 kt
AMB
210 kt
Speed Constraint Not Permitted
Aircraft Speed ≤ 220 kt
Aircraft Speed ≤ 210 kt

The speed constraint may be (in the following order of priority):
- A flight crew entry
- A database value (the speed constraints can be stored with the terminal area procedures in the navigation database).

L3 A holding pattern that is part of a procedure may have a database speed constraint. However, in this case, the speed constraint will not apply at the holding entry fix, but at the holding exit fix. If the flight crew wants the speed constraint to apply at the holding entry fix, they should manually enter the speed constraint at the holding entry fix, or engage the selected speed/Mach control.

L2 The flight crew can define a speed constraint at the takeoff, climb, descent and approach waypoints of the destination flight plan.

The flight crew cannot define a speed constraint at:
- The departure airport
- The destination airport
- The FROM waypoint
- A pseudo waypoint.

L3 AUTOMATIC DELETION OF THE SPEED CONSTRAINT(S)

- When the flight phase changes from CRZ, DES, or APPR, to GA, all speed constraints between the aircraft and the destination airport are deleted.
  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD.
  The "XXXXXXX" corresponds to the ident of the waypoint that follows the last down-path waypoint with a descent speed constraint.
- When the alternate flight plan is enabled, all speed constraints between the aircraft and the former destination airport, and all speed constraints in the alternate flight plan that are below the current aircraft altitude, are deleted.
  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD.
  The "XXXXXXX" corresponds to the ident of the waypoint that follows the last down-path waypoint with a speed constraint below the current aircraft altitude.
- When the waypoint, with the speed constraint, becomes an ABEAM waypoint when a DIRECT WITH ABEAM is performed, the constraint is deleted.

L1 SPEED ERROR

The FMS compares the speed constraint value with the predicted speed at the waypoint, and predicts whether the speed constraint will be respected or missed.
The speed constraint is predicted as missed, when the predicted speed is more than 10 kt above the speed constraint value. When missed, the speed constraint remains missed as long as the predicted speed is more than 5 kt above the speed constraint value.

Speed Error

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following messages:
- CONSTRAINTS BEFORE XXXXXXX : DELETED (*Refer to message*)
- SPD ERROR AT XXXXXXX (*Refer to message*).

SPD LIMIT

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-30-30-00004412.0001001 / 14 APR 14

PURPOSE

The flight crew uses the SPD LIMIT revision to enter, change, or delete the climb or descent speed limit.
The speed limit is a speed constraint to be respected, at and below the specified altitude.
There is only one speed limit for the CLB flight phase (climb speed limit) and/or one for the DES flight phase (descent speed limit).

Note: *The speed limit is not applied in the APPR flight phase.*

Speed Limit

10 000 ft
(SPD)
250 kt
(SPD)
230 kt
Aircraft Speed
⩽ 250 kt
Aircraft Speed
⩽ 230 kt

The speed limit may be (in the following order of priority):
- A flight crew entry
- A database value (the speed limits can be stored with the associated departure and destination airports in the navigation database)
- The FMS default value, that is 250 kt/10 000 ft.

EXCEEDED/MISSED SPEED LIMIT

The speed limit is exceeded, when the aircraft altitude is below the speed limit altitude, and the aircraft speed is more than 10 kt above the speed limit. When exceeded, the speed limit remains exceeded, as long as the aircraft speed is more than 5 kt above the speed limit.
When the speed limit is exceeded, the FMS displays the SPD LIMIT EXCEEDED message on the MFD.
The speed limit is predicted as missed, when the predicted speed at the speed limit altitude is more than 10 kt above the speed limit. When missed, the speed limit remains missed, as long as the predicted speed is more than 5 kt above the speed limit.

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the speed prediction associated with a waypoint of the CLIMB or DESCENT phase, or by selecting the CONSTRAINTS revision in the waypoint revisions menu.

On the F-PLN page, the speed limit is indicated by a pseudo waypoint: (SPD). This pseudo waypoint is inserted in the flight plan, where the aircraft will cross the speed limit altitude. A star to the left of the speed prediction of the pseudo waypoint indicates whether the speed limit is predicted to be respected or missed. The color of the star is magenta, if the constraint is predicted to be respected, or amber, if the constraint is predicted to be missed.

Note: *The flight crew can access the SPD panel of the VERT REV page via the speed limit pseudo waypoint, by clicking on its associated speed prediction, or by selecting the CONSTRAINTS revision in its revisions menu.*

For more information about the F-PLN page, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

ON THE ND

On the ND, the speed limit pseudo waypoint is indicated with a magenta dot, if the speed limit is respected. No dot is displayed, if the speed limit is missed.

Ident.: DSC-22-FMS-10-40-30-30-00004424.0001001 / 14 APR 14

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following message: SPD LIMIT EXCEEDED (*Refer to message*).

CMS

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-30-40-00004413.0001001 / 14 APR 14

PURPOSE

The flight crew uses the CMS revision to insert a constant Mach constraint on a cruise segment of the destination flight plan. In order to define the CMS, the flight crew enters:

- The start waypoint
  L2 The start waypoint may be any cruise waypoint of the destination flight plan, if it is not part of the departure or arrival procedure.
- L1 The end waypoint
  L2 The end waypoint may be any cruise waypoint of the destination flight plan, if it is not part of the departure or arrival procedure.
- L1 The Mach number.

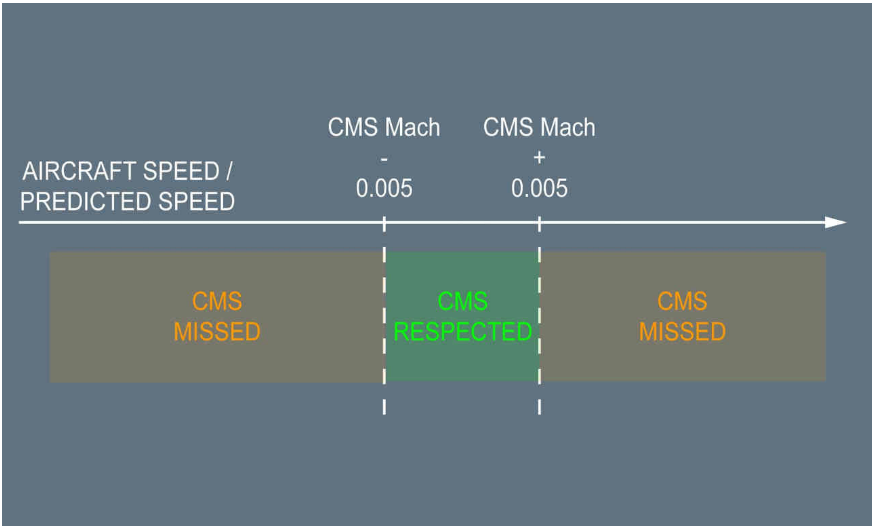
L2 The flight crew can create a CMS at all waypoints of the CRZ flight phase of the destination flight plan. The flight crew cannot create a CMS in the alternate flight plan.
The flight crew can create only one CMS in the flight plan.

L1 The flight crew can change or delete an existing CMS, even while the aircraft flies the cruise segment for which this CMS is defined.

MISSED CMS

The FMS compares the CMS Mach number with the aircraft speed and the predicted speed on the CMS waypoints, and computes whether the CMS will be respected or missed.
The CMS is predicted as missed when the aircraft speed, or predicted speed, is not within (CMS Mach - 0.005, CMS Mach + 0.005).

Missed CMS



L3 AUTOMATIC DELETION OF THE CMS

The existing CMS is automatically deleted, if one of the following occurs:
- The alternate flight plan is enabled
- The Engine-Out (EO) mode becomes active
- The flight phase changes from CRZ to another flight phase.

If the CMS is automatically deleted in the active flight plan, due to a flight phase transition from CRZ to another flight phase, the MACH SEGMENT DELETED message is displayed on the MFD.

L2 CMS REVISION AND SECONDARY FLIGHT PLAN

The CMS revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

CMS REVISION AND TEMPORARY FLIGHT PLAN

The insertion, change, or deletion of a CMS creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-30-40-00004426.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete the CMS on the CMS panel of the VERT REV page.

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the speed prediction, associated with the revised waypoint, or by selecting the CMS revision in the waypoint revisions menu.
On the F-PLN page, the CMS is indicated with a star to the left of the speed prediction of all the waypoints (except the start waypoint) of the segment. The color of the star is magenta, if the constraint will be respected, or amber, if the constraint will be missed.
For more information about the F-PLN page, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

ON THE ND

On the upper part of the ND, the CMS Mach number is displayed under the waypoint ident of all waypoints of the segment (except the start waypoint), when the CONSTRAINTS option is selected on the EFIS CP. The color of the constraint is magenta, if the constraint will be respected, or amber, if the constraint will be missed.
The upper part of the ND also displays the speed change indicator, where the aircraft will accelerate or decelerate to reach the required Mach of the CMS.
The CMS is not indicated on the VD.

Ident.: DSC-22-FMS-10-40-30-40-00004428.0001001 / 14 APR 14

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following message: MACH SEGMENT DELETED (*Refer to message*).

ALT CSTR

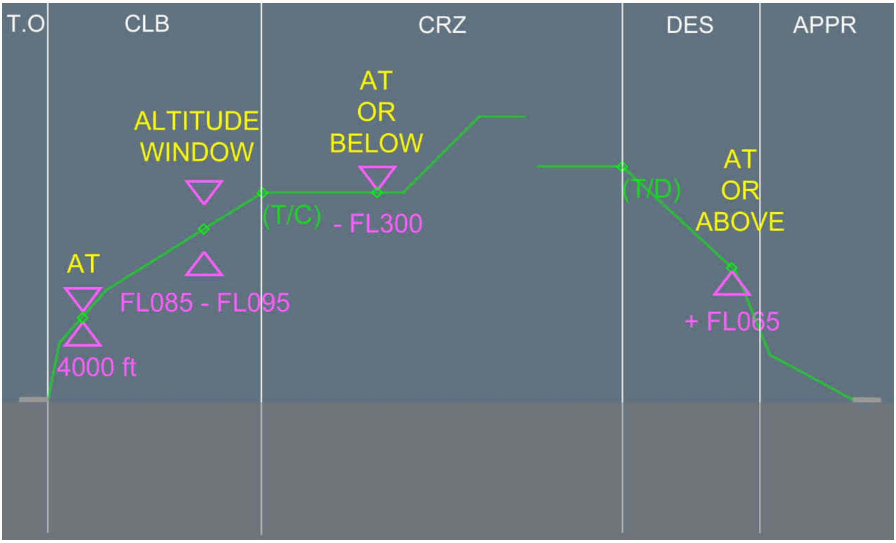
Applicable to: ALL

Ident.: DSC-22-FMS-10-40-30-50-00004414.0001001 / 18 JUN 15

PURPOSE

The flight crew uses the ALT CSTR revision to enter, change, or delete an altitude constraint at a waypoint.
The altitude constraint can be to reach the waypoint AT, AT OR BELOW, or AT OR ABOVE the specified altitude, or between two specified altitudes (ALTITUDE WINDOW).

Altitude Constraint



The altitude constraint can be (in the following order of priority):

- A flight crew entry, or
- A database value (the altitude constraints can be stored with the terminal area procedures in the navigation database).

Note: The ALTITUDE WINDOW constraint can only be a value from the navigation database. The flight crew cannot manually enter or change this constraint.

L2 The flight crew can define an altitude constraint at the takeoff, climb, descent, and approach waypoints of the destination flight plan. The flight crew cannot define an altitude constraint at the departure and destination airports, at the FROM waypoint, or at a pseudo waypoint.

L1 AUTOMATIC DELETION OF THE ALTITUDE CONSTRAINT(S)

The FMS automatically deletes from the F-PLN:

- The altitude constraints (AT, AT OR ABOVE, or AT OR BELOW) with value equal to or greater than the CRZ FL
- The upper constraint of an altitude window constraint if the value of the upper constraint is equal to or greater than the CRZ FL.

The MFD and the ND no longer display the deleted altitude constraints. The deleted altitude constraints are no longer used for the computation of the FMS climb and descent profile. In that case, the MFD displays the CONSTRAINTS ABOVE CRZ FL : DELETED message.

L2 This automatic deletion may occur if the flight crew inserts a SID, a STAR, a new CRZ FL, or step altitudes.

L1 The FMS also deletes obsolete constraints:

- When the FMS flight phase changes from CRZ(DES)(APPR) to GA, the FMS deletes all altitude constraints between the aircraft and the destination airpot
  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD.
  L2 The "XXXXXXX" corresponds to the ident of the waypoint that follows the last down-path waypoint with a descent altitude constraint.
- L1 When the alternate flight plan is activated, the FMS deletes the following altitude constraints:
  - Altitude constraints between the aircraft and the initial destination airport
  - Altitude constraints on the alternate flight plan that are below the current aircraft altitude.

  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD.
  L2 The "XXXXXXX" corresponds to the ident of the waypoint that follows the last down-path waypoint with a descent altitude constraint.
- L1 When a DIRECT TO with ABEAM is performed, the FMS deletes the altitude constraints of the ABEAM waypoint.

L2 ALTITUDE CONSTRAINT UNIT REFERENCE

The altitude constraint is in feet, if its value is less than the transition altitude.
The altitude constraint is in FL, if its value is above the transition altitude.
If there is a transition altitude change, the altitude constraints change accordingly.

Note: *The unit of measure of the altitude constraint does not change, if the flight crew changes the barometric reference.*
For example, if the barometric reference is changed from QNH to STD, a down-path altitude constraint that was defined in feet remains defined in feet.

L1 ALTITUDE ERROR

The FMS compares the altitude constraint value with the predicted altitude value at the waypoint, and predicts whether the altitude constraint will be respected or missed. The difference between the two values is referred to as the altitude error.
The altitude constraint is predicted as missed, if the altitude error becomes more than 250 ft.
When missed, the altitude constraint remains missed as long as the altitude error is more than 200 ft.

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the altitude prediction, associated with the revised waypoint, or by selecting the CONSTRAINTS revision in the waypoint revisions menu.

On the F-PLN page, the altitude constraint on a waypoint is indicated with a star to the left of the altitude prediction of the waypoint. The color of the star is magenta, if the constraint is predicted to be respected, or amber, if the constraint is predicted to be missed.

For more information about the F-PLN page, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

ON THE ND

On the upper part of the ND, the altitude constraint is indicated with a circle around the waypoint symbol. The constraint value under the waypoint ident is displayed, when the CONSTRAINTS option is selected on the EFIS CP. The color of the constraint and the circle is magenta, if the constraint is predicted to be respected, or amber, if the constraint is predicted to be missed.

On the VD, the altitude constraint is indicated with:
- An upside-down triangle, for the AT OR BELOW altitude constraint
- A triangle, for the AT OR ABOVE altitude constraint
- Two triangles (hourglass shape, with touching tips), for the AT altitude constraint
- Two triangles (hourglass shape, with tips that do not touch), for the ALTITUDE WINDOW constraint.

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following messages:
- CONSTRAINTS BEFORE XXXXXXX : DELETED (*Refer to message*)
- CONSTRAINTS ABOVE CRZ FL : DELETED (*Refer to message*).

STEP ALTS

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-30-60-00004415.0001001 / 25 APR 14

PURPOSE

The flight crew uses the STEP ALTs revision to insert or modify a step climb or step descent. A step climb or step descent is a change to a cruise altitude above or below , respectively.
The flight crew inserts step altitudes to create a vertical flight plan, with associated predictions, that correspond as much as possible to the computerized flight plan of the Operator.
The flight crew can define up to 10 steps.

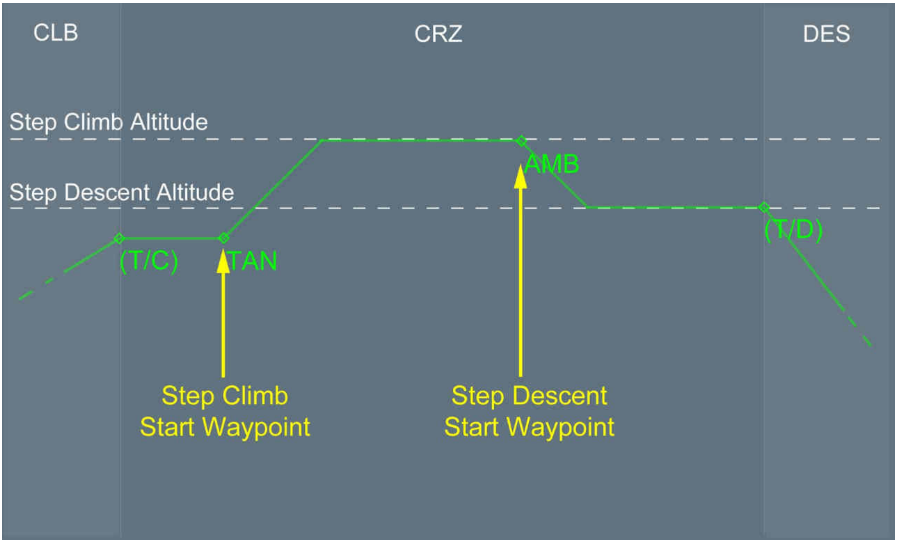
L2 The flight crew can insert up to 10 step altitudes on the cruise waypoints of the destination flight plan.

L1 The flight crew defines the step, by entering:

- The step altitude
- The step start waypoint.
  The step start waypoint is the waypoint on the flight plan, where the aircraft should leave the current cruise altitude to reach the step altitude.

  Note: *An automatic vertical maneuver will not occur, when reaching the step point. The flight crew must manually initiate the step climb or step descent by changing the AFS CP target altitude. The flight crew can do this at any time before reaching the step point.*

Step Altitudes



OPTIMUM STEP POINT

If the flight crew entered one or more altitude steps, the FMS computes an optimum step start point for the next down-path step, if it is a step climb. The FMS also computes the fuel and time savings that would be made, if the step climb was initiated at the optimum step, instead of at the start waypoint entered by the flight crew.

If there is no step in the flight plan, the FMS computes an optimum step start point, after entry of the step altitude. In this case, the fuel and time savings are computed between a flight plan with, and a flight plan without, the step climb.

L2 The optimum step point function is not available for the secondary flight plans.

Note: *When the active flight plan has an optimum step point, and the flight crew imports the active flight plan into a secondary flight plan, the optimum step point will not be copied into the secondary flight plan.*

IGNORED STEP

A step is ignored, when:
- The step end waypoint (the point of reaching the step altitude), is nearer than 50 NM to the T/D, or
- The step start point, or the step end waypoint, is located before the T/C or after the T/D.

Ignored steps are not deleted, but are ignored for the computation of predictions. An ignored step is not indicated in the flight plan on the MFD or the ND, but remains displayed on the STEP ALTS panel of the VERT REV page.
An ignored step may become a predicted step again, after a flight plan change.

L3 AUTOMATIC STEP DELETION

A step climb or step descent is automatically deleted, when:
- The step start waypoint is deleted or sequenced
- The Engine-Out (EO) mode becomes active
- In PREFLIGHT, T.O, or CLB flight phase, the flight crew changes the cruise flight level, and a step climb becomes a step descent, or vice versa
- In CRZ flight phase, the flight crew sets the AFS CP altitude above the aircraft altitude. In this case, all step descents, and all step climbs with a step altitude less than the new AFS CP altitude, are deleted.
- In CRZ flight phase, the flight crew sets the AFS CP altitude below the aircraft altitude. In this case, all step climbs, and all step descents with a step altitude above the new AFS CP altitude, are deleted.

When the step altitude is automatically deleted, the STEP DELETED message is displayed on the MFD.

L2 STEP ALTs REVISION AND SECONDARY FLIGHT PLAN

The STEP ALTs revision is available for the active (or temporary) flight plan, and for the secondary flight plans.

STEP ALTs REVISION AND TEMPORARY FLIGHT PLAN

The insertion, change, or deletion of a step climb or step descent creates a temporary flight plan.

Ident.: DSC-22-FMS-10-40-30-60-00004433.0001001 / 14 APR 14

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete step altitudes on the STEP ALTs panel of the VERT REV page.
The flight crew displays, enters, and updates the optimum step point in the OPTIMUM STEP POINT area at the bottom of the page.

For more information about the STEP ALTs panel of the VERT REV page, *Refer to DSC-22-FMS-20-20-20 VERT REV Page*.
The flight crew can access the VERT REV page via the F-PLN page, by clicking on the altitude prediction, associated with the revised waypoint, or by selecting the STEP ALTs revision in the waypoint revisions menu.
On the F-PLN page, the step point is indicated with the Step Climb (S/C) or Step Descent (S/D) pseudo waypoint.

ON THE ND

On the ND, the step start waypoint is indicated with the step climb or step descent symbol.

ASSOCIATED MESSAGES

On the MFD, the FMS message area displays the following messages:
- STEP ABOVE MAX FL (*Refer to message*)
- STEP AHEAD (*Refer to message*)
- STEP DELETED (*Refer to message*).

WIND

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-30-70-00004416.0001001 / 05 MAY 14

PURPOSE

The flight crew uses the WIND revision to check, insert, and modify flight plan winds.
Wind data must be entered to obtain correct flight plan predictions. The flight crew can enter an average trip wind for the entire flight, or can enter more precise wind data for the different flight phases and different waypoints of the flight plan cruise.
The FMS uses the inserted winds to compute the wind predictions of the flight plan. Then, the FMS uses the wind predictions to compute the other flight plan and performance predictions. For more information, *Refer to DSC-22-FMS-10-40-70 Wind Predictions*.

Company Wind Uplink

TRIP WIND

The trip wind is an average wind for the entire flight from the departure airport to the destination airport.

Note: *The predictions for the alternate flight plan do not take this trip wind into account. The trip wind for the alternate flight plan must be entered separately (See Alternate Trip Wind).*

The trip wind is defined as a headwind or tailwind component.
The FMS uses the trip wind for prediction computation, as long as no climb, cruise, descent, or approach winds are entered.

HISTORY WINDS

The history winds are the stored descent winds of the previous flight.
After the T/D of the previous flight, the FMS measures and stores the winds at CRZ FL, FL 250, FL 150, and FL 050.
In preflight, the flight crew can insert the history winds of the previous flight as the climb winds for the next flight.

CLIMB WINDS

The flight crew can insert climb winds on 5 different levels. The wind at Ground (GND) level can be entered as one of these levels. An altitude entry below 400 ft is considered as a ground level.
The flight crew can also insert the history winds as the climb winds. The inserted history winds can always be changed by the flight crew afterwards.
L2 The climb winds can only be inserted, or changed before the CLB phase.

L1 CRUISE WINDS AND TEMPERATURES

The flight crew can insert different cruise wind data for all cruise waypoints, and this for four different flight levels.

When the flight crew enters wind data on a waypoint:
- The associated flight level is propagated to all (up-path and down-path) cruise waypoints
- The wind direction and speed are propagated to the down-path cruise waypoints until the waypoint for which the flight crew has entered wind data for the same flight level.

The flight crew can always change (but not clear) propagated wind data.

Caption :
Flight Crew Entry
Propagated Value

For each cruise waypoint, the flight crew can insert a temperature for a specific flight level. The FMS uses the temperature data to define a temperature profile, that is used for prediction computation. The temperature is propagated to the down-path cruise waypoints in the same manner as the wind data.

L2 The FMS defines an estimated temperature profile based on the difference between a reference temperature profile, and a measured or entered Static Air Temperature (SAT) at different altitudes.

The reference temperature profile is defined by the tropopause altitude that is entered on the INIT page. The default tropopause altitude is the ISA tropopause.

The flight crew defines the deviation from the reference temperature profile, for the cruise waypoints, by entering the SAT associated to an altitude.

L1 DESCENT WINDS

The flight crew can insert descent winds on 5 different levels. The wind at Ground (GND) level at the destination airport can be entered as one of these levels. An altitude entry below 400 ft is considered as a ground level.

Note: The wind at ground level is also considered as the approach wind.

L2 The descent winds can only be inserted, or changed before the DES phase.

L1

APPROACH WIND

The flight crew can enter the approach wind at the destination airport. The approach wind is used for the approach speed computation.

Note: *The approach wind is also considered as the wind at ground level for the descent wind profile computation.*

ALTERNATE TRIP WIND

The alternate trip wind is an average cruise wind for the alternate flight plan (i.e. from the destination airport to the alternate airport).

The cruise flight level of the alternate flight plan is by default:
- FL 220, if the distance of the alternate flight plan is less than 200 NM
- FL 310, if the distance of the alternate flight plan is 200 NM or more

The alternate trip wind is defined by a wind direction and wind speed.
The flight crew can always change the alternate flight level and the associated trip wind.

COMPANY WIND UPLINK

The flight crew can request company wind and temperature data for the active and the three secondary flight plans. The received wind and temperature data will be associated with the flight plan from which the request was sent.
The company can also uplink wind and temperature data without any request from the flight crew. These wind data will be associated with the active flight plan.

L2

WIND REVISION AND SECONDARY FLIGHT PLAN

The WIND revision is available for the active flight plan, and for the secondary flight plans.

WIND REVISION AND TEMPORARY FLIGHT PLAN

The insertion, change, or deletion of any wind data does not create a temporary flight plan. However, the insertion, change, or deletion of wind data creates a set of temporary winds. The temporary winds are not taken into account for prediction computation, before they are inserted.

Note: *The insertion of history winds does not create temporary winds. The history winds are directly inserted as the climb winds of the active flight plan.*

The insertion, change, or deletion of any wind data is not possible, if a temporary flight plan is on standby.
When temporary winds are on standby and the FMS creates a temporary flight plan, the temporary winds are automatically inserted in the active and temporary flight plans. The FMS message area displays the DRAFT WIND INSERTED message.

Diversion

INTRODUCTION

Ident.: DSC-22-FMS-10-40-40-00004439.0001001 / 14 APR 14
Applicable to: ALL

To prepare an en-route diversion over oceanic and deserted areas, the flight crew uses the Equi-Time Point (ETP) function to determine the diversion point(s) between two diversion airports:*Refer to DSC-22-FMS-10-40-40 Equi-Time Point (ETP) Function*.
The flight crew defines the diversion airports before departure, or in flight, by using the closest airports data: *Refer to DSC-22-FMS-10-40-40 CLOSEST AIRPORTS Function*.
The flight crew can use the WHAT IF function to assess the capability of the aircraft to reach a diversion airport in the case of a specific failure event (engine-out or depressurization): *Refer to DSC-22-FMS-10-40-40 WHAT IF Function*.
When the flight crew defines the most appropriate diversion point and diversion airport, they prepare the diversion on the secondary flight plan: *Refer to DSC-22-FMS-10-40-40 Secondary Flight Plan*.
The flight crew performs a diversion by activating the secondary flight plan: *Refer to DSC-22-FMS-10-40-40 Performing a Diversion*.
If the flight crew decides to divert at the end of the cruise, beyond the last ETP, or in the DES or GA phase, they will most probably divert to the alternate airport by using the ALTERNATE and ENABLE ALTERNATE revisions: *Refer to DSC-22-FMS-10-40-40 Diversion to an Alternate Airport*.

EQUI-TIME POINT (ETP) FUNCTION

Ident.: DSC-22-FMS-10-40-40-00004440.0001001 / 14 APR 14
Applicable to: ALL

The flight crew uses the Equi-Time Point (ETP) function to compute the point along the lateral flight plan where the time to reach two designated reference airports(waypoints) is the same.
The default reference airports are the departure and destination airports. The flight crew may overwrite these default airports, and insert the local wind values at the applicable cruise flight level.

The FMS computes and updates regularly the ETP, by using:
- The current aircraft speed: Managed or selected speed
- The flight plan winds, combined with the winds at the reference airports.

The FMS defines the ETP as a place/distance waypoint associated with the subsequent waypoint (e.g. RANAH/-40.5NM).
L2 The ETP can only be on a cruise flight leg, and cannot be in a holding pattern or procedure turn.

L1 The FMS also provides the following data:

- From the current position of the aircraft to the ETP:
  - Distance along the flight plan
  - Estimated time of arrival at the ETP, based on a trajectory along the flight plan
- From the current position of the aircraft to the reference airports:
  - Bearing (BRG)
  - Direct Distance (DIST)
  - Estimated time of arrival at the reference airport, based on a direct trajectory
- From the ETP to the reference airports:
  - Track (TRK)
  - Direct Distance (DIST)
  - Estimated time of arrival at the reference airport, based on an overfly of the ETP and a direct trajectory between the ETP and the reference airport.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can compute the ETP on the EQUI-TIME POINT page.

There is no associated pseudo waypoint on the F-PLN page.

Note: *In order to indicate the ETP on the F-PLN page, and/or to prepare the next applicable ETP on the EQUI-TIME POINT page, the flight crew may define a time marker at the estimated time of arrival at the ETP. The flight crew defines time markers on the POSITION/TIME page (Refer to page).*

ON THE ND

The ND displays the ETP pseudo waypoint.

CLOSEST AIRPORTS FUNCTION

Ident.: DSC-22-FMS-10-40-40-00004441.0001001 / 25 APR 14
Applicable to: ALL

The CLOSEST AIRPORTS function computes the four database airports, that are closest to the current position of the aircraft.

For each airport, the FMS computes:
- The direct Distance (DIST) between the current position of the aircraft and the airport
- The Bearing (BRG) to the airport
- The estimated time of arrival at the airport, based on a direct trajectory
- The Estimated Fuel On Board (EFOB) at the airport
- An Effective Wind (EFF WIND) default value, based on the flight plan winds.
  The flight crew may overwrite this default value.

The fuel and time predictions are based on:
- The great circle distance and bearing to the airport
- The effective winds (default values, or values entered by the flight crew)
- The current delta ISA
- A flight from the current position to the ground, based on:
  - A computed cruise distance, flown at an optimum cruise Mach (based on the current CRZ FL, GW, FMS speed mode (ECON/LRC)) in managed speed control, or at the selected Mach in selected speed control.
    L2 In the case of an engine-out, the EO LRC Mach, and the EO MAX FL (or the CRZ FL, if it is less than the EO MAX FL) are considered.
  - L1 A continuous descent from the CRZ FL to the airport elevation.

The flight crew can also enter up to three other airports, for which they want to compute the associated predictions.

CONTROLS AND INDICATORS

The CLOSEST AIRPORTS page displays the closest airports and their associated data.

In addition, during oceanic or deserted area flights, the flight crew may use the BRG / DIST TO function on the POSITION/MONITOR page to continuously monitor the direct distance and bearing to the selected diversion airport(s) (*Refer to DSC-22-FMS-20-20-20 POSITION/MONITOR Page*).

WHAT IF FUNCTION

Ident.: DSC-22-FMS-10-40-40-00011320.0001001 / 05 MAY 14
Applicable to: ALL

PURPOSE

The WHAT IF function enables the flight crew to assess the capability of the aircraft to reach a diversion airport in the case of a specific type of failure. This specific type of failure is referred to as a WHAT IF event.

The WHAT IF event can be:
- An engine-out that occurs during the CRZ flight phase, or
- Depressurization that occurs during the CRZ flight phase.

The flight crew uses the WHAT IF function to simulate a WHAT IF event for a secondary flight plan.
The WHAT IF function is not available for the active flight plan.

Note: *The FMS cannot simulate more than one WHAT IF event at a time for one secondary flight plan. However, the flight crew can select one WHAT IF event for each of the three secondary flight plans at the same time. The WHAT IF event can be different for each secondary flight plan.*

The FMS computes the flight plan predictions based on a WHAT IF scenario:
- If the WHAT IF event is a simulated engine-out, the WHAT IF scenario is referred to as the ENGINE OUT scenario
- If the WHAT IF event is simulated depressurization, the WHAT IF scenario is referred to as the DEPRESSURIZATION scenario.

The waypoint at which the WHAT IF event occurs is referred to as the revised waypoint.

L12

Note: *The FMS automatically cancels the WHAT IF scenario in the secondary flight plan, if one of the following occurs:*
- *The flight crew clicks on the CANCEL WHAT IF button*
- *The revised waypoint at which the FMS simulated the WHAT IF event was not P.POS, and the aircraft sequences this revised waypoint*
- *The flight crew uses the SWAP function (i.e. the secondary flight plan becomes the active flight plan, and vice versa)*
- *The revised waypoint at which the FMS simulated the WHAT IF event is no longer a cruise waypoint of the flight plan.*
- *The EO mode becomes active.*

ENGINE OUT SCENARIO

For the ENGINE OUT scenario, the FMS computes the GDOT Engine-Out Maximum Flight Level (GDOT EO MAX FL).

The GDOT EO MAX FL is the maximum flight level at which the aircraft can:
- Level off at EO-GDOT speed
- Begin to accelerate toward the EO-LRC speed.

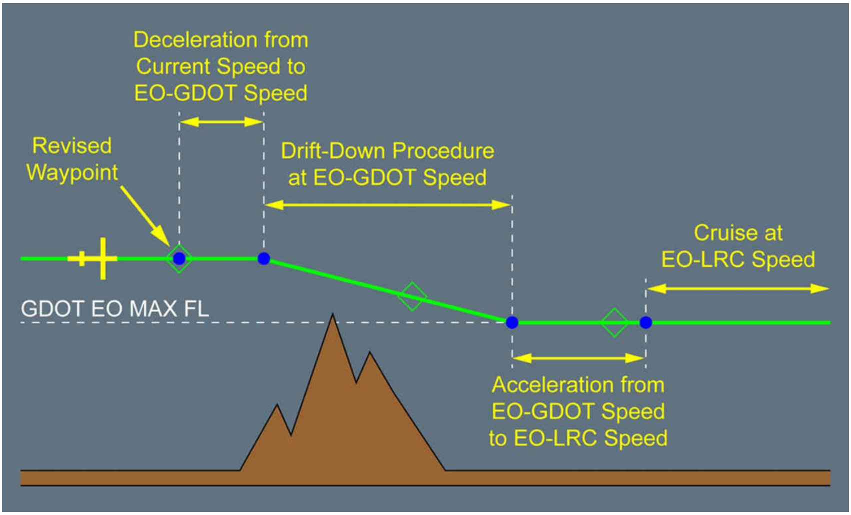
The ENGINE OUT scenario depends on the predicted altitude at the revised waypoint.

Above the GDOT EO MAX FL

If the predicted altitude at the revised waypoint is above the GDOT EO MAX FL, the ENGINE OUT scenario is the following scenario (the following steps occur in the following sequence):
- At the revised waypoint, the aircraft levels off, and decelerates from the current speed to the EO-GDOT speed
- The flight crew performs a drift-down procedure at the EO-GDOT speed

- When the aircraft reaches the GDOT EO MAX FL, the aircraft levels off, and accelerates from the EO-GDOT speed to the EO-LRC speed
- The aircraft performs a cruise at the EO-LRC speed.
  The GDOT EO MAX FL is the cruise flight level by default. The flight crew can change this cruise flight level via the WHAT IF page.

ENGINE OUT Scenario [WHAT IF Event above GDOT EO MAX FL]



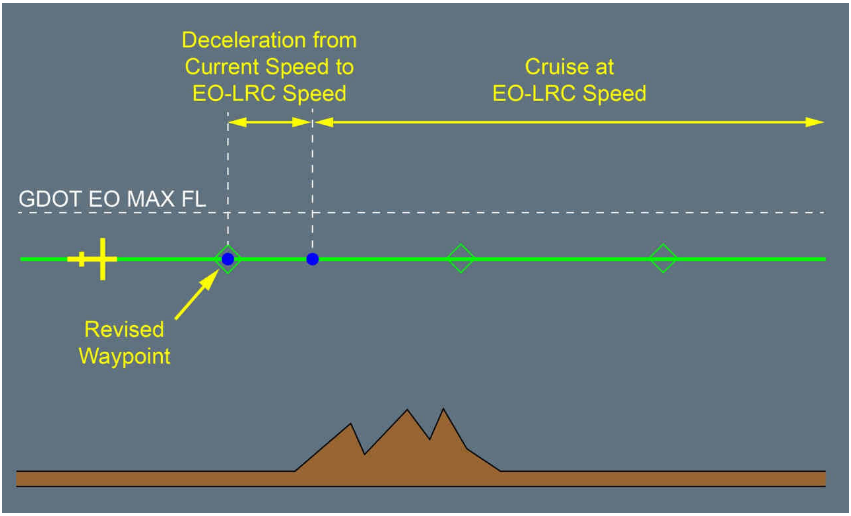
Deceleration from Current Speed to EO-GDOT Speed
Revised Waypoint
Drift-Down Procedure at EO-GDOT Speed
Cruise at EO-LRC Speed
GDOT EO MAX FL
Acceleration from EO-GDOT Speed to EO-LRC Speed

Below the GDOT EO MAX FL

If the predicted altitude at the revised waypoint is below the GDOT EO MAX FL, the ENGINE OUT scenario is the following scenario (the following steps occur in the following sequence):

- At the revised waypoint, the aircraft levels off, and decelerates from the current speed to the EO-LRC speed
- The aircraft performs a cruise at the EO-LRC speed.
  The predicted altitude of the revised waypoint is the cruise flight level by default. The flight crew can change this cruise flight level via the WHAT IF page.

ENGINE OUT Scenario [WHAT IF Event below GDOT EO MAX FL]



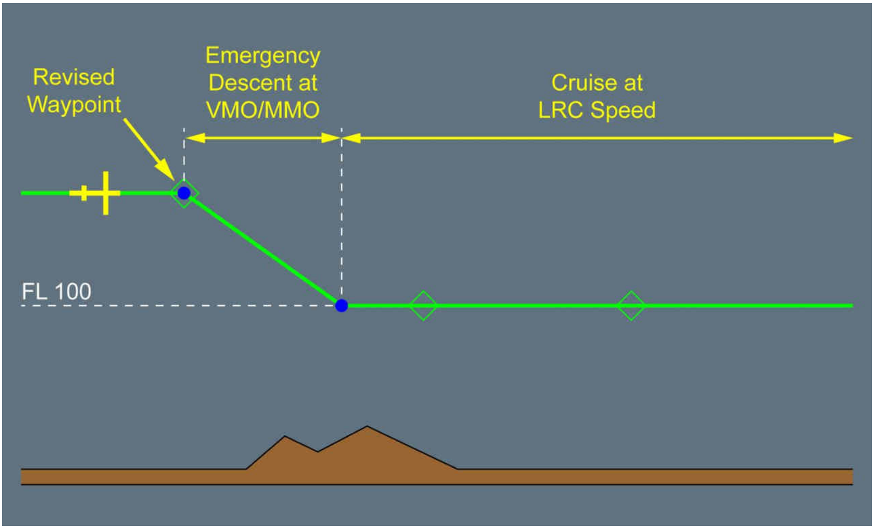
Deceleration from
Current Speed to
EO-LRC Speed
Cruise at
EO-LRC Speed
GDOT EO MAX FL
Revised
Waypoint

DEPRESSURIZATION SCENARIO

The DEPRESSURIZATION scenario is the following scenario (the following steps occur in the following sequence):

- At the revised waypoint, the flight crew performs an emergency descent at VMO/MMO
- When the aircraft reaches FL 100, the aircraft levels off, and performs a cruise at the LRC speed.
  FL 100 is the cruise flight level by default. The flight crew can change this cruise flight level via the WHAT IF page.

DEPRESSURIZATION Scenario



Revised Waypoint
Emergency Descent at VMO/MMO
Cruise at LRC Speed
FL 100

CONTROLS AND INDICATORS

The flight crew uses the WHAT IF page:

- To enter and display the parameters that the FMS uses to simulate a WHAT IF event
- To assess the capability of the aircraft to reach the destination airport of the secondary flight plan, in the case of a WHAT IF event.

Temporary Flight Plan

TEMPORARY FLIGHT PLAN

Ident.: DSC-22-FMS-10-40-50-00004446.0001001 / 17 APR 14
Applicable to: ALL

When the flight crew makes a flight plan revision, the FMS creates a temporary flight plan.
A temporary flight plan is a copy of the active flight plan, in which the flight plan revision(s) are taken into account. This revised flight plan temporarily appears instead of the active flight plan to enable the flight crew to check the effect of the revision(s) on the flight plan before the revision(s) are really inserted.
While there is a temporary flight plan, the FMS continues to use the original active flight plan for guidance and radio navigation tuning.

There is a temporary flight plan, until:
- The flight crew inserts the temporary flight plan: The temporary flight plan becomes the new active flight plan
- The flight crew erases the temporary flight plan: The revisions are not taken into account. The active flight plan does not change.

L2 When both FMS are in DUAL mode, there can be only one temporary flight plan at a time.

L1 CREATION OF A TEMPORARY FLIGHT PLAN

The FMS either creates or updates a temporary flight plan, when the flight crew performs a lateral or vertical revision (except for a WIND revision) of the active flight plan. A revision of a secondary flight plan does not create a temporary flight plan.

For more information about:
- Lateral revisions, *Refer to DSC-22-FMS-10-40-20 Overview*
- Vertical revisions, *Refer to DSC-22-FMS-10-40-30 Overview*.

L3 The FMS automatically creates a temporary flight plan, when the FMS Engine-Out (EO) mode becomes active at takeoff, before the EOSID diversion point. For more information, *Refer to DSC-22-FMS-10-60 Engine-Out Standard Instrument Departure (EOSID)*.

L2 The FMS does not create a temporary flight plan, when the flight crew:
- Changes the cruise flight level
- Changes the FMS speed mode (ECON/LRC), CI that is associated with the ECON mode, ZFW, ZFWCG, fuel data, FUEL PENALTY factor, PERF factor, and IDLE factor
- Changes any wind or temperature value

- Inserts a time marker
- Exits or resumes a holding pattern.
  For more information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

L1 MULTIPLE REVISIONS

The flight crew can make multiple lateral and vertical revisions in the same temporary flight plan.

Note: *Multiple revisions are not possible, when:*
- *The flight crew created a temporary flight plan via the DIR TO revision. In this case, the flight crew cannot make any other flight plan revisions to this temporary flight plan. The flight crew must first insert or erase the temporary flight plan.*
- *The flight crew created a temporary flight plan via a revision other than the DIR TO revision. In this case, the flight crew cannot insert a DIR TO in this temporary flight plan. The flight crew must first insert or erase the temporary flight plan.*

When there is a temporary flight plan with multiple revisions, the flight crew can UNDO the last revision, in order to remove the last revision from the temporary flight plan.

Note: *The flight crew can only UNDO the last revision made to the temporary flight plan. After the last revision is removed, the flight crew can only insert or erase the entire temporary flight plan.*

L2 TEMPORARY FLIGHT PLAN SEQUENCING

The temporary flight plan is sequenced with the active flight plan, if the first flight leg of the temporary flight plan is identical to the first flight leg of the active flight plan.

Note: *When the NAV mode is engaged, and the flight crew attempts to insert a temporary flight plan with a first flight leg that is different from the active flight leg, the SELECT HDG OR TRK FIRST message appears on the MFD.*

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-40-50-00004447.0001001 / 14 APR 14
Applicable to: ALL

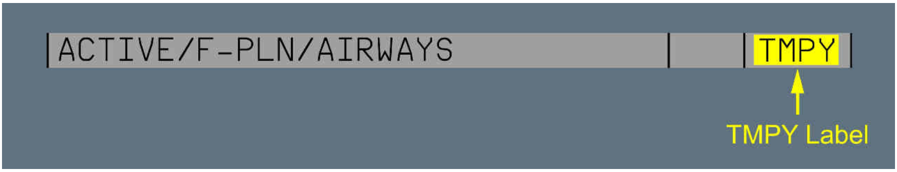
When both FMS are in DUAL mode, the temporary flight plan data is displayed on the MFD and the ND of the Captain, and on the MFD and the ND of the First Officer.

ON THE MFD

If a temporary flight plan is on standby, the FMS page header displays the TMPY label on the following pages:
- The flight-plan revision pages (e.g. AIRWAYS page)
- The F-PLN page
- The FUEL&LOAD page

- The INIT page
- The PERF page
- The SEC INDEX page
- The WIND page.

FMS Page Header



The temporary flight plan appears in yellow on the ACTIVE/F-PLN page. The active flight plan that is used for guidance and navaid tuning cannot be displayed on the MFD, when there is a temporary flight plan. The flight crew uses the temporary flight plan as they use the active flight plan.

For more information about the F-PLN page, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.
The revision data on a flight-plan revision page appears in yellow, if the revision creates or updates the temporary flight plan.
For example, if the flight crew creates a temporary flight plan by inserting a time constraint, the data on the RTA panel of the VERT REV page appears in yellow. However, the data on the other panels of the VERT REV page (ALT, SPD, CMS, and STEP ALTs) does not appear in yellow, because the revisions of these panels are not included in the temporary flight plan.

ON THE ND

The ND displays the temporary flight plan as a yellow dashed line.
The active flight plan remains on the ND in green, when there is a temporary flight plan. The active flight plan is used for guidance and navaid tuning. However, the waypoints of the active flight plan that are not part of the temporary flight plan are no longer interactive.
The revision data on the DIRECT TO and INSERT NEXT WPT revision windows of the ND appear in yellow.

INSERT/ERASE/UNDO

The flight crew can insert or erase the temporary flight plan on the ND. The INSERT and ERASE(UNDO) buttons appear in the bottom right and left corners of the ND.

Note: *The INSERT and ERASE(UNDO) buttons appear, only when the cursor is on the ND.*

ASSOCIATED MESSAGES

Ident.: DSC-22-FMS-10-40-50-00004448.0001001 / 14 APR 14
Applicable to: ALL

On the MFD, the FMS message area displays the following messages:
- INSERT OR ERASE TMPY F-PLN FIRST (*Refer to message*)
- SELECT HDG OR TRK FIRST (*Refer to message*).

Secondary Flight Plans

ACTIVE AND SECONDARY FLIGHT PLANS

Ident.: DSC-22-FMS-10-40-60-00002138.0001001 / 14 APR 14
Applicable to: ALL

The FMS can simultaneously store four flight plans: One active flight plan, and three secondary flight plans.
The FMS uses the active flight plan for lateral and vertical long-term guidance, and for radio navigation automatic tuning.

The flight crew uses the secondary flight plans to:
- Prepare a second takeoff runway and/or departure procedure, in preflight
- Prepare a second landing runway and/or approach procedure
- Plan a diversion
- Prepare a down-path flight plan or an entire flight plan
- Compare predictions of possible flight plans
- Store a company or an ATC flight plan before this flight plan is activated.

SECONDARY FLIGHT PLAN INITIALIZATION

Ident.: DSC-22-FMS-10-40-60-00002139.0001001 / 14 APR 14
Applicable to: ALL

In order to initialize a secondary flight plan, the flight can:
- Use a copy of the active flight plan, or of one of the secondary flight plans
- Uplink a company flight plan from the company ground station (if the option is installed)
- Enter the initialization data of the flight plan on the SEC 1(2)(3)/INIT and SEC 1(2)(3)/F-PLN pages
- Upload an ATC flight plan from the ATC mailbox.

COPY OF AN ACTIVE (OR SECONDARY) FLIGHT PLAN

A copy of the active (or secondary) flight plan includes:
- Flight plan data (e.g. company route, cruise flight level, FMS speed mode (ECON/LRC), wind, speed constraints, etc.)
- Fuel and load data (e.g. ZFWCG, ZFW, block fuel, etc.)
- Performance data (e.g. V1, VR, V2, flaps setting, etc.)

L2 A copy of the active flight plan remains connected to the active flight plan by the following parameters:
- Flight number
- Cruise flight level and temperature
- Tropopause altitude

- FMS speed mode (ECON/LRC)
- CI, if the FMS speed mode is ECON
- Before engine start: ZFW, ZFWCG, minimum fuel at destination, and block fuel
- Route reserve and final fuel (time) data
- Passenger number.

When the flight crew changes one of the above-mentioned parameters in the active flight plan, the FMS automatically updates the same parameter in the secondary flight plan.
However, if the flight crew changes one of the above-mentioned parameters in the secondary flight plan, the active and secondary flight plans are no longer connected.

Note: *The connection does not apply to a copy of a secondary flight plan: A copy of a secondary flight plan is independent from the original secondary flight plan.*

L1 UPLOAD OF AN ATC FLIGHT PLAN

The flight crew can transfer an ATC flight plan to the FMS via the LOAD function on the ATC mailbox.
By clicking on the LOAD→SEC 3 button on the ATC mailbox, the ATC flight plan is inserted in the third secondary flight plan (SEC 3).

Note: *If there is a flight plan in SEC 3, this flight plan will be deleted, when the ATC flight plan is uploaded.*
To prevent an inadvertent loss of a flight plan, the flight crew must copy SEC 3 flight plan in SEC 1(2), before the flight crew upload the ATC flight plan.

SECONDARY FLIGHT PLAN SEQUENCING

Ident.: DSC-22-FMS-10-40-60-00002140.0001001 / 14 APR 14
Applicable to: ALL

A secondary flight plan is sequenced with the active flight plan, if:
- The secondary flight plan is a copy of the active flight plan (or a copy of a secondary flight plan that was created with a copy of the active flight plan), and
- The first flight leg of the secondary flight plan is identical to the active flight leg of the active flight plan.

Note: *The active flight leg is the flight leg that is between the present position of the aircraft and the TO waypoint.*

SECONDARY FLIGHT PLAN PREDICTIONS

Ident.: DSC-22-FMS-10-40-60-00002141.0001001 / 14 APR 14
Applicable to: ALL

The FMS computes the same flight plan predictions for the three secondary flight plans as for the active flight plan, and uses the same rules and assumptions as for the active flight plan prediction computation.
For more information about flight plan prediction computation, *Refer to DSC-22-FMS-10-40-70 Introduction*.

The predictions of a secondary flight plan, that is created by copying the active flight plan, are based on the following parameters that are related to the current situation and environment of the aircraft:
- GW, FOB, CG
- UTC time
- Aircraft position
- PERF, FUEL PENALTY, and IDLE factors
- Lateral and vertical guidance modes
- AFS CP altitude target
- Wind and temperature values, etc.

However, a secondary flight plan that is created via the SEC1(2)(3)/INIT page considers that the aircraft is on ground, before engine start. In this case, the predictions are not based on the current aircraft and environment parameters. The secondary flight plan is completely independent from the active flight plan.

SECONDARY FLIGHT PLAN REVISIONS

Ident.: DSC-22-FMS-10-40-60-00002142.0001001 / 14 APR 14
Applicable to: ALL

The flight crew can make all lateral (except DIR TO and FIX INFO) and vertical revisions to the three secondary flight plans.

For more information about:
- Lateral revisions, *Refer to DSC-22-FMS-10-40-20 Overview*
- Vertical revisions, *Refer to DSC-22-FMS-10-40-30 Overview*.

If the flight crew makes a flight plan revision to a secondary flight plan, this does not create a temporary flight plan.

SECONDARY AND ACTIVE FLIGHT PLAN EXCHANGE

Ident.: DSC-22-FMS-10-40-60-00002143.0001001 / 14 APR 14
Applicable to: ALL

The SWAP function enables the flight crew to activate the secondary flight plan, and to deactivate the active flight plan. A copy of the deactivated flight plan is stored in the secondary flight plan.

L3 If the flight crew does not define the flight number, FMS speed mode (ECON/LRC), CI (if the FMS speed mode is ECON), ZFW, ZFWCG, block fuel, or taxi fuel for the secondary flight plan, the FMS maintains the value of the deactivated flight plan for the specific parameter, when the exchange is performed.

L1 The SWAP function is always available on ground.

In flight, the SWAP function is available, when:
- The NAV mode is engaged, and the first flight leg of the selected secondary flight plan is identical to the active flight leg, or
- The HDG/TRACK mode is engaged.

When the NAV mode is engaged and the first flight leg of the secondary flight plan is different from the active flight leg, the flight crew cannot use the SWAP function to activate the secondary flight plan: The flight crew cannot select the SWAP ACTIVE button on the SEC INDEX page. In this case, the flight crew must engage the HDG/TRACK mode first. Then, they can use the SWAP function.

Note: The SWAP function is not available, when a temporary flight plan is on standby, or when the secondary flight plan is empty.

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-40-60-00002144.0001001 / 14 APR 14
Applicable to: ALL

ON THE MFD

The flight crew can access the three secondary flight plans via the SEC INDEX page.
The SEC INDEX page provides a route summary, and access to the main SEC pages that are associated with each secondary flight plan.

L2 The SEC pages have the same content as the ACTIVE pages, except that:

- The system-computed values appear in white (they appear in green on the ACTIVE pages)
- There are no mandatory parameters (i.e. no amber boxes)
- On the SEC/INIT page:
  - It is not possible to access the DEPARTURE, FUEL&LOAD, PERF, POSITION/IRS, POSITION/NAVAIDS, and ROUTE SUMMARY pages
  - The latitude and longitude of the reference point of the departure airport are not displayed

- On the SEC/PERF page:
  - The optimum and recommended maximum flight levels are not displayed
  - It is not possible to access the POSITION/MONITOR page
  - The Engine-Out (EO) mode is not available
  - The ACTIVATE APPR button is not available
  - On the CLB, CRZ, and DES panels, the time and distance predictions for the different speed profiles are not available
  - On the T.O panel, the CPNY T.O REQUEST button is not available
  - On the DES panel, the DES CABIN RATE entry field and the vertical deviation are not available
  - On the APPR panel, the VREF is not available
- On the SEC/WIND page, the history winds are not available.

L1 ON THE ND

When a SEC page is displayed, the associated secondary flight plan appears in white on the ND.

Note: *The flight crew cannot make revisions to the secondary flight plan via the interactive ND.*

Flight Plan Predictions

INTRODUCTION

Ident.: DSC-22-FMS-10-40-70-00004449.0001001 / 14 APR 14
Applicable to: ALL

The FMS computes flight plan predictions for the active, temporary, and secondary flight plans.
The predictions are based on the flight plan, the current state of the aircraft (i.e. position, GW, CG, etc.), and its environment (i.e. wind, temperature, etc.).

Flight plan predictions include:
- Time of arrival, speed, altitude, Estimated Fuel on Board (EFOB), and wind at each waypoint
- Pseudo waypoints
  For more information about pseudo waypoint, *Refer to DSC-22-FMS-10-40-10 Pseudo Waypoints*.
- Equi-Time Point (ETP).

  Note: The FMS does not compute the ETP for secondary flight plans.

  For more information about the ETP function, *Refer to DSC-22-FMS-10-40-40 Equi-Time Point (ETP) Function*.

START AND UPDATE OF PREDICTIONS

Ident.: DSC-22-FMS-10-40-70-00004451.0001001 / 14 APR 14
Applicable to: ALL

In the PREFLIGHT flight phase, the FMS starts to compute the flight plan predictions, when the following data is available:
- The lateral flight plan
- The Cruise Flight Level (CRZ FL)
- The FMS speed mode (ECON/LRC)
- The CI, if the FMS speed mode is ECON

  Note: At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
  - *Selects the LRC mode*
  - *Sets the CI value to 0.*
- The aircraft Gross Weight (GW).

L2 Before engine start, the FMS computes the GW from the ZFW and block fuel values that the flight crew entered.
After engine start, the FMS uses the GW that the FQMS computes.

L1 The FMS updates the predictions at regular intervals when some specific events occur (e.g. lateral or vertical flight plan change, FMS speed mode change, CI change, load data change, etc.).

Note: *After an FMS reset, the predictions may be lost. Entering the FMS speed mode (ECON/LRC) again (even when the MODE entry field or the CI entry field is not empty) may make the predictions reappear.*

WIND PREDICTIONS

Applicable to: ALL

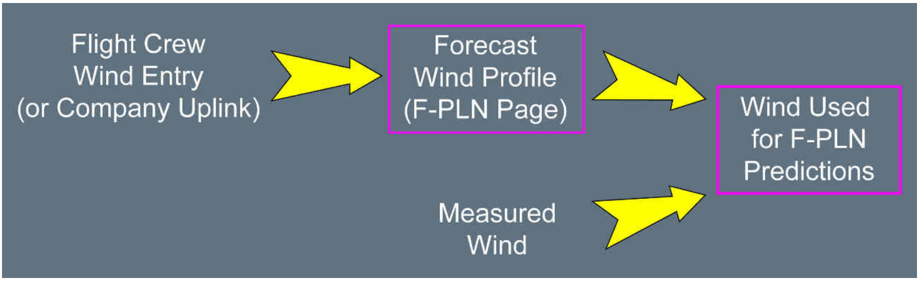
Ident.: DSC-22-FMS-10-40-70-10-00004453.0001001 / 14 APR 14

The computation of the wind predictions considers:

- The wind data that are entered by the flight crew (or sent by the Operator via uplink)
- The measured wind.

The FMS computes a forecast wind profile, based on the wind that is entered by the flight crew. The forecast wind appears on the F-PLN page.
In flight, the FMS takes into account the measured wind to compute a corrected wind profile that is used for the flight plan predictions (i.e. time, EFOB, etc.). This corrected wind profile never appears on the F-PLN page.

Wind Prediction Computation



Flight Crew Wind Entry (or Company Uplink)
Forecast Wind Profile (F-PLN Page)
Wind Used for F-PLN Predictions
Measured Wind

The wind prediction computation is different for the climb, cruise, or descent waypoints.

Ident.: DSC-22-FMS-10-40-70-10-00004458.0001001 / 14 APR 14

WIND PREDICTIONS AND TRIP WIND

TRIP WIND ENTRY

During preflight, the flight crew can enter a trip wind value, in order to obtain flight plan predictions before entering more specific wind data.
The flight crew enters the trip wind value on the INIT page (*Refer to page*).

When the flight crew enters any climb, cruise, or descent data, the trip wind is not taken into account for the prediction computation.

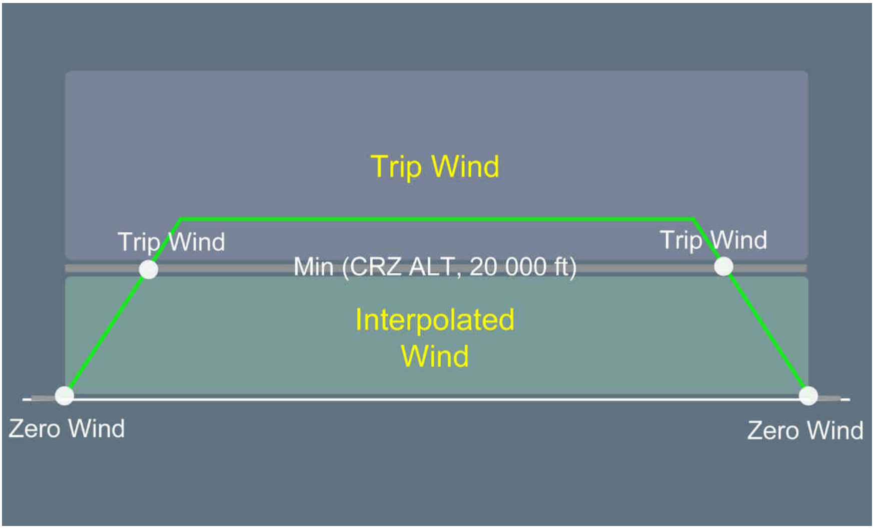
FORECAST WIND PROFILE

The FMS creates the following forecast wind profile, when the flight crew only enters the trip wind value:

- In cruise: The trip wind applies for all altitudes
- In climb and descent:
  - Below 20 000 ft (or below the cruise flight level, if it is below 20 000 ft): The wind is interpolated between zero wind at ground level (departure or destination elevation) and the trip wind at 20 000 ft.
  - Above 20 000 ft (or above the cruise flight level, if it is below 20 000 ft): The trip wind applies for all altitudes.

Note: *The F-PLN page displays the trip wind for all climb, cruise, and descent waypoints. The interpolated wind profile below 20 000 ft is used for prediction computation, but does not appear on the F-PLN page.*

Trip Wind



CORRECTED WIND PROFILE

When in flight, the FMS takes into account the measured wind. This wind correction depends on the flight phase, and is explained below.

Ident.: DSC-22-FMS-10-40-70-10-00004459.0001001 / 14 APR 14

WIND PREDICTIONS FOR CLIMB WAYPOINTS

WIND ENTRY

The flight crew can insert climb wind values for 5 different flight levels, and can enter the wind at Ground (GND) level as one of these levels.
The flight crew enters the climb wind values on the CLB panel of the WIND page (*Refer to page*).

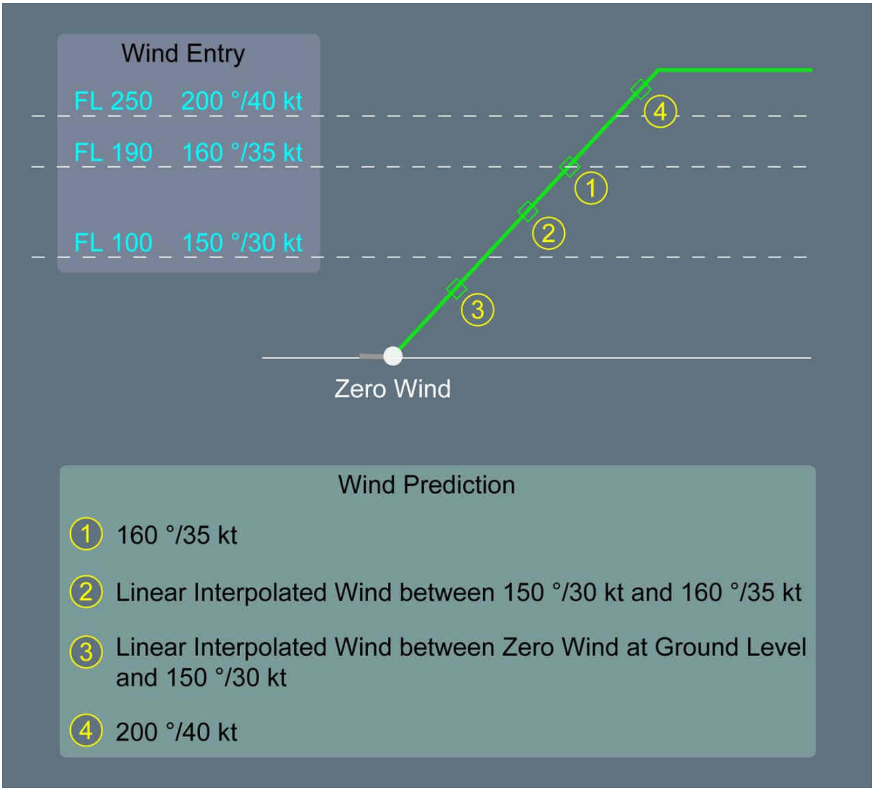
FORECAST WIND PROFILE

The FMS creates a forecast wind profile for the climb waypoints, as follows:

- If the predicted altitude at a waypoint corresponds to one of the entered climb wind altitudes, the predicted wind at the waypoint is the associated climb wind
- If the predicted altitude at a waypoint is between two entered climb wind altitudes, the predicted wind at the waypoint is a linear interpolation between the two associated climb winds
- If the predicted altitude at a waypoint is below the lowest entered climb wind altitude (no surface wind is entered), the predicted wind at the waypoint is a linear interpolation between zero wind at ground level, and the lowest entered climb wind
- If the predicted altitude at a waypoint is above the highest entered climb wind altitude, the predicted wind at the waypoint is the extrapolated highest entered climb wind.

Note: *If the flight crew does not enter any climb wind nor trip wind value, the FMS uses 0 °/0 kt as default value.*

Climb Waypoint Predictions



Wind Prediction

① 160 °/35 kt

② Linear Interpolated Wind between 150 °/30 kt and 160 °/35 kt

③ Linear Interpolated Wind between Zero Wind at Ground Level and 150 °/30 kt

④ 200 °/40 kt

CORRECTED WIND PROFILE

During climb, the FMS takes into account the measured wind, as follows:

- At the current altitude of the aircraft, the corrected wind is equal to the measured wind
- At more than 10 000 ft above the current altitude of the aircraft, the FMS no longer corrects the wind with the measured wind: The wind prediction is equal to the forecast wind
- Between the current altitude of the aircraft and 10 000 ft above the current altitude, the corrected wind is a linear interpolation between the measured wind and the forecast wind.

Ident.: DSC-22-FMS-10-40-70-10-00004460.0001001 / 14 APR 14

WIND PREDICTIONS FOR CRUISE WAYPOINTS

WIND ENTRY

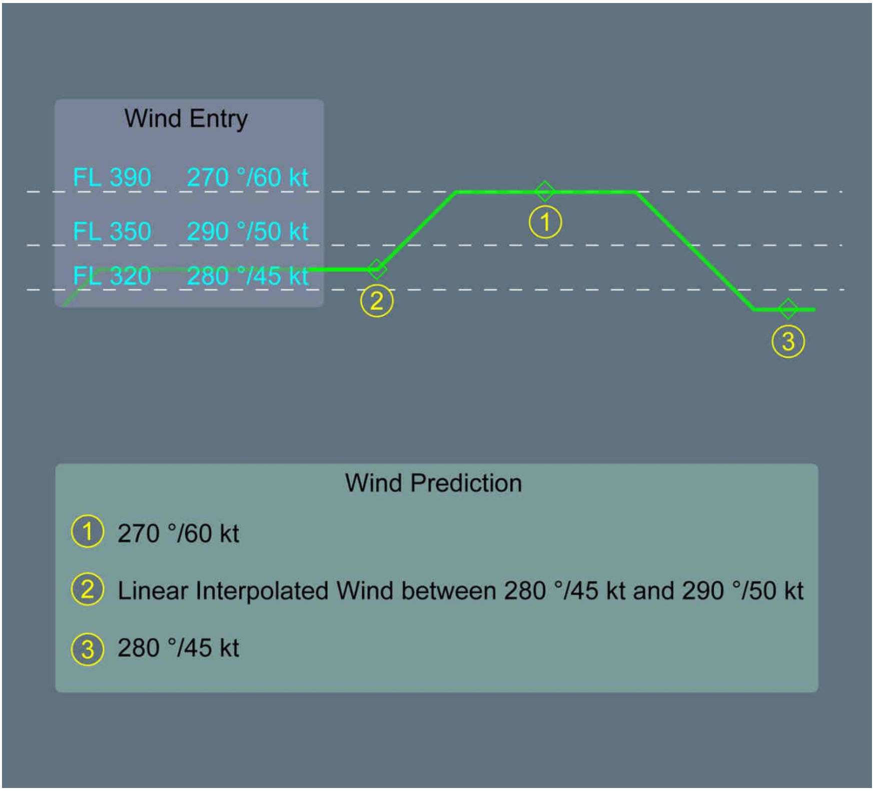
The flight crew can insert different cruise wind data for all cruise waypoints, for four different flight levels.
When the flight crew enters wind data at a waypoint, the wind values are automatically propagated to the down-path cruise waypoints, up to the waypoint for which the flight crew entered other wind data for the same flight level.
The flight crew enters the cruise wind values on the CRZ panel of the WIND page (*Refer to page*).

FORECAST WIND PROFILE

The FMS creates a forecast wind profile for the cruise waypoints, as follows:

- If the predicted altitude at a waypoint corresponds to one of the entered or propagated cruise wind altitudes, the predicted wind at the waypoint is the associated cruise wind
- If the predicted altitude at a waypoint is between two entered or propagated cruise wind altitudes, the predicted wind at the waypoint is a linear interpolation between the two associated cruise winds
- If the predicted altitude at a waypoint is above(below) the highest(lowest) entered or propagated cruise wind altitude, the predicted wind at the waypoint is the wind at the highest(lowest) entered or propagated cruise wind.

Cruise Waypoint Predictions



Wind Entry
FL 390 270 °/60 kt
FL 350 290 °/50 kt
FL 320 280 °/45 kt
①
②
③
Wind Prediction
① 270 °/60 kt
② Linear Interpolated Wind between 280 °/45 kt and 290 °/50 kt
③ 280 °/45 kt

When in flight, the FMS corrects the predicted wind profile with the measured wind. The measured wind is laterally propagated to 200 NM ahead of the aircraft, and to 10 000 ft above and below the aircraft. The influence of the measured wind decreases with the distance and altitude from the aircraft.

The F-PLN page displays the wind predictions without the measured wind correction.

CORRECTED WIND PROFILE

During cruise, the FMS takes into account the measured wind, as follows:

- At the current position and current altitude of the aircraft, the corrected wind is equal to the measured wind
- At more than 200 NM ahead of the aircraft, or more(less) than 10 000 ft above(below) the current altitude of the aircraft, the FMS no longer corrects the wind with the measured wind: The wind prediction is equal to the forecast wind
- Between the current altitude of the aircraft and 10 000 ft above(below) the current altitude, the corrected wind is a linear interpolation between the measured wind and the forecast wind
- Between the current position of the aircraft and 200 NM ahead of the aircraft, the corrected wind is a linear interpolation between the measured wind and the forecast wind.

Ident.: DSC-22-FMS-10-40-70-10-00004461.0001001 / 25 APR 14

WIND PREDICTIONS FOR DESCENT WAYPOINTS

WIND ENTRY

The flight crew can insert descent wind values for 5 different flight levels, and can enter the wind at Ground (GND) level as one of these levels.

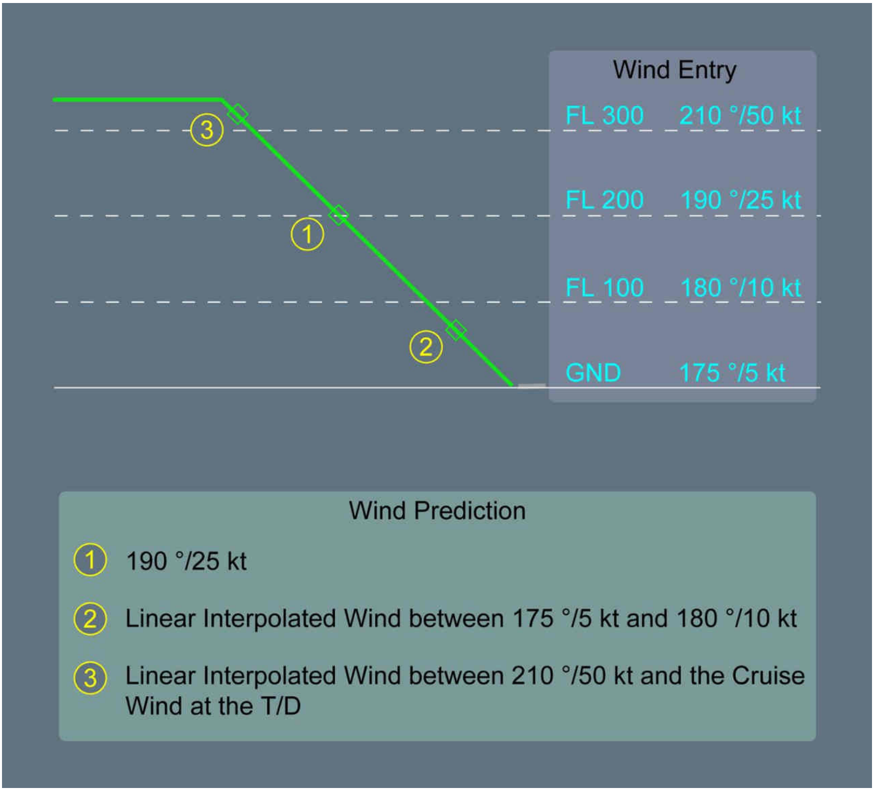
FORECAST WIND PROFILE

The FMS creates a forecast wind profile for the descent waypoints, as follows:

- If the predicted altitude at a waypoint corresponds to one of the entered descent wind altitudes, the predicted wind at the waypoint is the associated descent wind
- If the predicted altitude at a waypoint is between two entered descent wind altitudes, the predicted wind at the waypoint is a linear interpolation between the two associated descent winds
- If the predicted altitude at a waypoint is below the lowest entered descent wind altitude (no surface wind is entered), the predicted wind at the waypoint is a linear interpolation between zero wind at ground level, and the lowest entered descent wind
- If the predicted altitude at a waypoint is above the highest entered descent wind altitude, the predicted wind at the waypoint is a linear interpolation between the cruise wind at the T/D, and the highest entered descent wind.

Note: *If the flight crew does not enter any descent wind nor trip wind value, the predicted descent winds are a linear interpolation between the cruise wind at T/D, and zero wind at ground level.*

Descent Waypoint Predictions



Wind Entry
FL 300 210 °/50 kt
FL 200 190 °/25 kt
FL 100 180 °/10 kt
GND 175 °/5 kt
③
①
②
Wind Prediction
① 190 °/25 kt
② Linear Interpolated Wind between 175 °/5 kt and 180 °/10 kt
③ Linear Interpolated Wind between 210 °/50 kt and the Cruise Wind at the T/D

CORRECTED WIND PROFILE

During descent, the FMS takes into account the measured wind, as follows:

- At the current altitude of the aircraft, the corrected wind is equal to the measured wind
- Less than 10 000 ft below the current altitude of the aircraft, the wind is no longer corrected with the measured wind: The wind prediction is equal to the forecast wind
- Between the current altitude of the aircraft and 10 000 ft below the current altitude, the corrected wind is a linear interpolation between the measured wind and the forecast wind.

Ident.: DSC-22-FMS-10-40-70-10-00004462.0001001 / 05 MAY 14

WIND PREDICTIONS FOR THE ALTERNATE FLIGHT PLAN

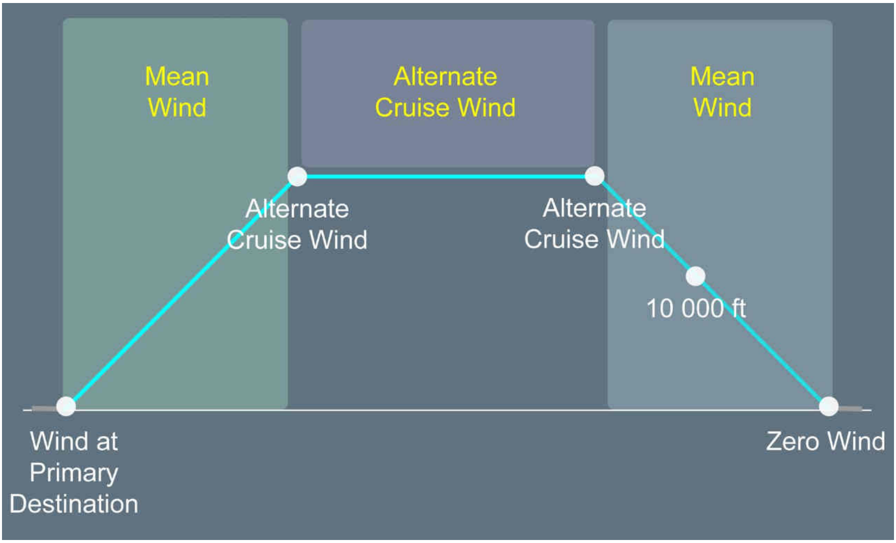
The flight crew can enter an alternate cruise wind.

The cruise flight level of the alternate flight plan is by default:
- FL 220, if the distance of the alternate flight plan is less than 200 NM
- FL 310, if the distance of the alternate flight plan is 200 NM or more

The FMS creates the following forecast wind profile for the alternate flight plan:
- For the alternate climb phase, the FMS applies a mean climb wind between the wind at the destination airport and the entered alternate cruise wind
- For the alternate cruise phase, the FMS applies the entered alternate cruise wind
- For the alternate descent phase, the FMS applies a mean descent wind between the entered alternate cruise wind and the interpolated wind at 10 000 ft. The wind at 10 000 ft is a linear interpolation between the entered alternate cruise wind and zero wind at ground level.

Note: *The FMS uses the alternate wind profile for prediction computation, but the alternate wind profile does not appear on the F-PLN page.*
When the flight crew enables the alternate flight plan, it becomes part of the active flight plan, and the wind profile is computed in the same manner as for the active flight plan.

Predictions for the Alternate Flight Plan



PREDICTIONS AND SELECTED MODES

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-70-20-00004454.0001001 / 14 APR 14

The FMS creates a lateral and vertical flight plan that the aircraft will fly, when the lateral and vertical managed modes are engaged.
When one or more selected modes are engaged, the predictions are updated to indicate the new situation of the aircraft.
The update of the predictions is based on the following philosophy: The selected modes are short-term modes, and are only engaged temporarily. The FMS assumes that the flight crew will quickly return to managed modes. The assumed moment of return to managed flight plan predictions depends on the selected mode, and the flight phase, as explained below.

Ident.: DSC-22-FMS-10-40-70-20-00004463.0001001 / 14 APR 14

HDG/TRACK MODE

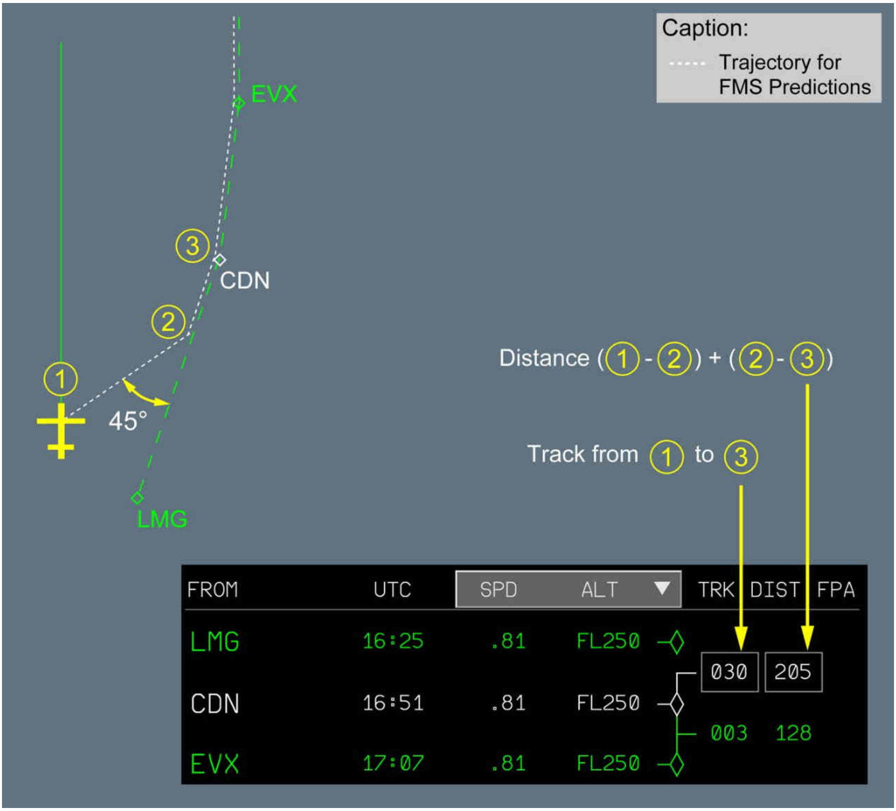
When the HDG/TRACK mode engages, the FMS assumes an immediate return to the lateral flight plan. This rule is valid for all flight phases.
The return path is the direct flight leg from the aircraft present position to the TO waypoint, with an intersection angle of 45 ° between the direct flight leg and the lateral flight plan.

If a direct flight leg with an intersection angle of 45 ° is not possible, the return path has two flight legs:

- An intersection flight leg from the aircraft present position to an intersection point on the lateral flight plan
  The intersection point corresponds to an intersection angle of 45 ° between the intersection flight leg and the lateral flight plan.
- A flight leg from the intersection point and the TO waypoint.

In all cases, on the F-PLN page, the return path appears as a direct flight leg (with its distance and track), and as the first flight leg of the flight plan.

Immediate Return to Lateral Flight Plan



FROM	UTC	SPD	ALT	TRK	DIST	FPA

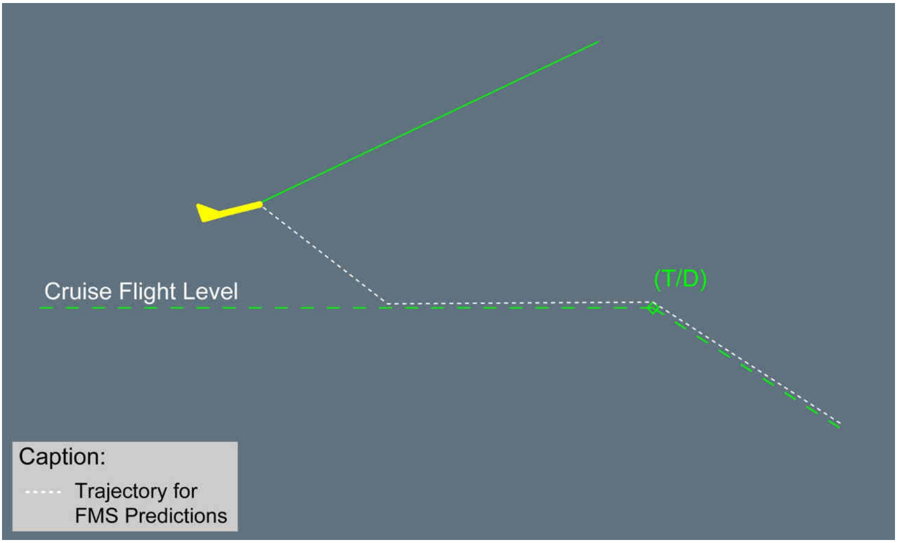
OP CLB, OP DES, OR V/S / FPA MODE

When the OP CLB, OP DES, or V/S / FPA mode engages, the FMS assumes that the flight crew will immediately disengage the selected mode, and:
- During the climb phase: The CLB mode will immediately reengage
- During the cruise phase: The aircraft will immediately return to the cruise flight level (in CLB or DES mode, if necessary)
- During the descent phase: The aircraft will immediately return to the FMS descent profile in the DES mode.

Immediate Return to Cruise Altitude



Ident.: DSC-22-FMS-10-40-70-20-00004465.0001001 / 14 APR 14

SELECTED SPEED/MACH

The FMS assumptions depend on the flight phase:

DURING TAKEOFF AND CLIMB

When the selected speed/Mach control engages, the FMS assumes that the flight crew will engage the managed speed control at the next speed limit(constraint), if at this speed limit(constraint) the managed speed becomes more than the selected speed.
If the managed speed does not become more than the selected speed at the speed limit(constraint), or if there is no speed limit(constraint), the FMS assumes that the flight crew will engage the managed speed control at the Top of Climb (T/C).

DURING CRUISE

When the selected speed/Mach control engages, the FMS assumes that the flight crew will engage the managed speed control at the top of descent (T/D).

L3 When the flight crew selects a CAS(Mach) and there is a step altitude in the flight plan, that intersects the CAS/Mach crossover altitude, the FMS uses the Mach(CAS) that corresponds to the selected CAS(Mach) for the predictions beyond the crossover altitude.

L1 DURING DESCENT

When the selected speed/Mach control engages, the FMS assumes that the flight crew will engage the managed speed control at the start of the deceleration to the next speed limit(constraint), if at this speed limit(constraint) the managed speed becomes less than the selected speed.

If the managed speed does not become less than the selected speed at the speed limit(constraint), or if there is no speed limit(constraint), the FMS assumes that the flight crew will engage the managed speed control:
- At the deceleration point (start of the approach segment), if the managed speed after deceleration is less than the selected speed, or
- Beyond the deceleration point, when the managed speed becomes less than the selected speed.

L3 When the flight crew selects a Mach, the FMS uses the CAS that corresponds to the selected Mach, for predictions beyond the crossover altitude.

PREDICTIONS DURING A GO-AROUND

Ident.: DSC-22-FMS-10-40-70-00004455.0001001 / 14 APR 14
Applicable to: ALL

The FMS does not compute the waypoint vertical predictions for the missed approach segment.
The F-PLN page only displays the distance and track of the missed approach flight legs, and displays dashes for the time, speed, altitude, EFOB, and wind predictions. If there is an altitude or speed constraint on a missed approach waypoint, the constraint value appears in magenta on the F-PLN page.

During the GA flight phase, the FMS provides only the following data for the destination and alternate airports:
- Distance
- EFOB
- Estimated Time of Arrival (ETA)
- Route reserve, final, and extra fuel.

For these predictions, the FMS does not consider any speed or altitude constraints, or wind.

L2 Note: *The FMS does not compute the vertical predictions during the GA phase. The FMS cannot manage a vertical flight plan, when the vertical predictions are not available. At the GA ACCEL ALT, the CLB phase becomes active and the FMS computes again the vertical predictions, by taking into account the flight plan constraints.*
When the flight crew sets an AT or AT OR BELOW constraint, that has a constraint value that is equal to the GA ACCEL ALT, the FMS will not take into account this constraint, because the FMS will start the prediction computation when the constraint altitude is already sequenced.

PREDICTIONS FOR THE ALTERNATE FLIGHT PLAN

Ident.: DSC-22-FMS-10-40-70-00004456.0001001 / 14 APR 14
Applicable to: ALL

As soon as the flight crew inserts the alternate airport and the alternate flight plan, the FMS computes the following predictions:
- The alternate trip time and trip fuel
- The Estimated time and Fuel On Board (FOB) at the alternate airport
- The estimated extra fuel at the alternate airport.

The alternate predictions are based on the following assumptions:
- The initial aircraft weight for the alternate flight plan is equal to the estimated landing weight at the destination airport
- The alternate flight plan corresponds to a flight from takeoff at the destination airport to landing at the alternate airport
- The distance of the alternate flight plan is:
  - The distance along the company alternate route, or
  - The distance along the alternate flight plan, if the flight crew created the alternate flight plan, or
  - The direct distance between the destination airport and the alternate airport, if there are no waypoints between the destination airport and the alternate airport
- The cruise flight level of the alternate flight plan is by default:
  - FL 220, if the distance of the alternate flight plan is less than 200 NM
  - FL 310, if the distance of the alternate flight plan is equal to or more than 200 NM.
- The delta ISA is constant along the alternate flight plan, and is equal to the delta ISA at the destination airport
- The alternate trip wind is a constant value that the flight crew enters on the DES panel of the WIND page

L2 For more information about the WIND page, *Refer to DSC-22-FMS-20-20-20 WIND Page*.
For more information about the wind predictions for the alternate flight plan, *Refer to DSC-22-FMS-10-40-70 Wind Predictions for the Alternate Flight Plan*.

L1 - The FMS speed mode (ECON/LRC) is LRC (minimum fuel optimization).

Intentionally left blank

Datalink with Company Ground Station

INTRODUCTION

Ident.: DSC-22-FMS-10-40-80-00004466.0001001 / 14 APR 14
Applicable to: ALL

With the COMPANY COM application, it is possible to transfer data:
- From the FMS to the company ground station, i.e data requests and reports
- From the company ground station to the FMS, i.e. data messages.

The COMPANY COM application enables the transfer of the following data:
- F-PLN initialization data: *Refer to DSC-22-FMS-10-40-80 Initialization Data of the Flight Plan*
- Wind data: *Refer to DSC-22-FMS-10-40-80 Wind Data*
- Takeoff data: *Refer to DSC-22-FMS-10-40-80 Takeoff Data*
- Flight reports: *Refer to DSC-22-FMS-10-40-80 Flight Reports*
- Broadcast data: *Refer to DSC-22-FMS-10-40-80 Broadcast Data*.

For more information about the COMPANY COM application, *Refer to DSC-46-OIS-10-40 COMPANY COM*.

L2 The FMS sends the requests and reports to the ground station via the Avionics Communication Router (ACR).
The ACR receives the data from the company ground station, and sends it to the FMS.
If a communication failure occurs between the FMS and the ACR, the FMS message area displays the NOT TRANSMITTED TO ACR message.

L3 For more information about the ACR, *Refer to DSC-23-10-10 ACR*.

INITIALIZATION DATA OF THE FLIGHT PLAN

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-80-10-00004467.0001001 / 14 APR 14

The flight crew can request and receive the following initialization data of the flight plan from the company ground station:

- Flight number
- Lateral and vertical F-PLN data:
  - FROM, TO, and ALTN airports
  - Waypoints, airways, speed/altitude constraints, step, hold procedures
- Associated performance and load data:
  - Cruise flight level
  - Tropopause altitude
  - Cruise temperature
  - PERF factor
  - CI
  - Climb transition altitude
  - ZFW, ZFWCG
  - Block fuel
  - Taxi fuel
  - Route reserve.

Ident.: DSC-22-FMS-10-40-80-10-00004472.0001001 / 14 APR 14

COMPANY F-PLN REQUEST

The flight crew can send a F-PLN request:

- Before engine start: For the active and secondary flight plans

L2 *Note: For active F-PLN, a request is only possible, when active F-PLN is empty.*

L1
- After engine start: For the secondary flight plan only.

Only one request is possible at a time, for active or secondary flight plan.
The flight crew can initiate a company F-PLN request by using the CPNY F-PLN REQUEST button on the INIT page, or on the SEC INDEX page.

For more information about:

- The INIT page, *Refer to DSC-22-FMS-20-20-20 INIT Page*
- The SEC INDEX page, *Refer to DSC-22-FMS-20-20-20 SEC INDEX Page*.

CPNY F-PLN REQUEST Button

CPNY F-PLN
REQUEST

When clicked, displays the COMPANY F-PLN REQUEST page, where the flight crew can add the flight number, the company route, and any free text before sending the request.
For more information about the COMPANY F-PLN REQUEST page, *Refer to DSC-22-FMS-20-20-20 COMPANY F-PLN REQUEST Page*.
After the flight crew sends the request, the button label changes to REQUEST PENDING... , until the flight plan data is received.

REQUEST PENDING Label

REQUEST
PENDING...

L2 If the FMS does not receive a response from the company ground station within 4 min after the request:
- The FMS message area displays the NO COMPANY REPLY message
- The associated buttons on the INIT, SEC INDEX, and COMPANY F-PLN REQUEST pages enable a new flight plan request.

Ident.: DSC-22-FMS-10-40-80-10-00004473.0001001 / 14 APR 14

RECEIVED COMPANY F-PLN

The FMS receives initialization data of the flight plan:
- In response to the flight crew request, or
- Directly without previous request from the flight crew.

The FMS may receive:
- Flight plan data only
- Flight plan data with associated performance and load data
- Performance and load data only.

When the FMS receives the uplink, it displays one of the following messages in the FMS message area:
- COMPANY F-PLN RECEIVED WAITING FOR INSERTION: The uplink has only flight plan data
- COMPANY F-PLN & LOAD RECEIVED WAITING FOR INSERTION: The uplink has flight plan and performance and load data
- COMPANY LOAD DATA RECEIVED WAITING FOR INSERTION: The uplink has only performance and load data

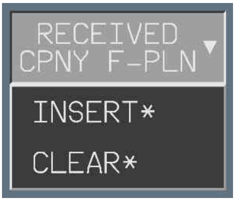
- RECEIVED COMPANY F-PLN NOT VALID: The flight plan, uplinked from the company ground station, is not valid
- RECEIVED FLT NUMBER NOT VALID: The received flight number, that is part of the uplinked flight plan data, is not valid.

L3 After insertion, the FMS message area may display one of the following messages:

- CHECK CPNY RTE: The company route ident of the uplinked flight plan differs from the company route ident of the flight plan request
- FLT NUMBER RECEIVED: The FMS received the flight number, as part of the uplinked flight plan data, without previous request from the flight crew
- CHECK FLT NUMBER: The company uplinked flight number differs from the flight number of the flight plan request.

L1 The flight crew can insert the uplink via the RECEIVED CPNY F-PLN button (or the RECEIVED CPNY LOAD button, if the uplink has only performance and load data) on the INIT page, or on the SEC INDEX /page.

RECEIVED CPNY F-PLN Menu



When clicked, opens a menu:

- INSERT: Inserts the uplink
- CLEAR: Clears the uplink.

Note: *The flight crew cannot preview the received data before insertion.*

The following table indicates the rules of insertion for the active and secondary flight plans:

	The active flight plan is empty			**There is an active flight plan**	
	Uplink received without request	Request from active	Request from secondary	Uplink received without request	Request from secondary
Before Engine Start	Insertion in active or secondary		Insertion in secondary only		
After Engine Start	Insertion in secondary only				

Note: *The flight crew can only insert performance and load data before engine start.*

WIND DATA

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-80-20-00004468.0001001 / 14 APR 14

The flight crew can request and receive the following wind data from the company ground station:
- Climb winds
- Cruise winds
- Descent winds
- Alternate winds.

The flight crew can request and receive the wind data for active or secondary flight plans.

Ident.: DSC-22-FMS-10-40-80-20-00004474.0001001 / 14 APR 14

COMPANY WIND REQUEST

The flight crew can send a wind request in all flight phases, except in DES, APPR, and GA.
Before sending a request to the ground, the flight crew may define a minimum of flight plan information, depending on the forecast wind data they need (e.g. cruise flight level, waypoints, top of climb, step climb, etc.). The FMS will send this information with the request .
Only one request is possible at a time, for active or secondary flight plan.
The flight crew can initiate a wind request by using the CPNY WIND REQUEST button on the INIT page or WIND page.

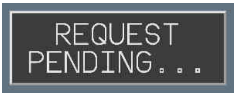
For more information about the:
- INIT page, *Refer to DSC-22-FMS-20-20-20 INIT Page*
- WIND page, *Refer to DSC-22-FMS-20-20-20 WIND Page*.

CPNY WIND REQUEST Button

CPNY WIND
REQUEST

When clicked, displays the COMPANY WIND DATA REQUEST page, where the flight crew can add any free text before sending the request. The request refers to the F-PLN from where it is sent.
For more information about the COMPANY WIND DATA REQUEST page, *Refer to DSC-22-FMS-20-20-20 COMPANY WIND DATA REQUEST Page*.
After the flight crew sends the request, the button label changes to REQUEST PENDING... , until the wind data is received.

REQUEST PENDING Label



REQUEST
PENDING...

L2 If the FMS does not receive a response from the company ground station within 4 min after the request:

- The FMS message area displays the NO COMPANY REPLY message
- The associated buttons on the INIT page and WIND page enable a new wind request.

Ident.: DSC-22-FMS-10-40-80-20-00004475.0001001 / 14 APR 14

RECEIVED COMPANY WIND

The FMS receives the wind data:

- In response to the flight crew request: The received wind data is associated with the flight plan from which the request was sent
- Directly without previous request from the flight crew: The received wind data is associated with the active flight plan only.

Note: *If the active flight plan is empty, the received data are in a buffer, until the active flight plan is filled.*

To ensure its compatibility with the active or secondary flight plans, the received wind message has wind data for different waypoints on different altitudes or flight levels. The wind data that is not compatible with the flight plan is automatically deleted.

The FMS may receive:

- Climb wind data: Wind direction and wind speed for up to 5 altitudes and/or flight levels
- Cruise wind data: Wind direction and wind speed for up to 4 flight levels, for a list of cruise waypoints
- Descent wind data:
  - Wind direction and wind speed for up to 5 altitudes and/or flight levels
  - The destination delta ISA, QNH, and the transition flight level
- Alternate wind data: Wind direction and wind speed for the alternate cruise flight level.

Note: *If the flight crew inserts wind data, with destination QNH, and/or destination surface wind, and/or destination OAT, the three values are updated on the APPR panel of the PERF page.*
In this case, when the aircraft is less than 180 NM from destination, the FMS displays the CHECK DES DATA message to notify the flight crew that the QNH, and/or surface wind, and/or OAT, were completed by a company wind uplink.

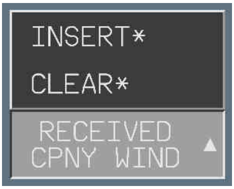
When the FMS receives the uplink, the MFD displays one of the following messages in the FMS message area:

- COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN ACTIVE: The uplink has wind data compatible with the active flight plan
- COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN SEC1(2)(3): The uplink has wind data compatible with the secondary 1(2)(3) flight plan
- COMPANY WIND UPLINK PENDING: The FMS receives company wind data, while there is a temporary flight plans, or the DIRECT TO page is displayed. The flight crew needs to insert or clear the temporary flight plan, or needs to complete the DIRECT TO revision, before they can insert the received wind data.

L3 - RECEIVED COMPANY WIND DATA NOT VALID: The wind data, uplinked from the company ground station, is not valid.

L1 The flight crew can insert the uplink via the RECEIVED CPNY WIND button on the WIND page.

RECEIVED CPNY WIND Menu



When clicked, opens a menu:

- INSERT: Inserts the uplink
- CLEAR: Clears the uplink.

TAKEOFF DATA

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-80-30-00004469.0001001 / 14 APR 14

The flight crew can request and receive the following takeoff data from the company ground station:

- Takeoff speeds: V1, VR, V2
- Thrust rating: TOGA, FLEX
- Flaps setting
- Thrust reduction and acceleration altitudes
- Noise procedure parameters.

The flight crew can request and receive takeoff data for the active flight plan only.

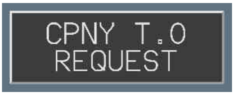
Ident.: DSC-22-FMS-10-40-80-30-00004476.0001001 / 14 APR 14

COMPANY TAKEOFF DATA REQUEST

The flight crew can send a takeoff data request before engine start, for the active flight plan only. The flight crew can initiate a takeoff data request for two runways by using the CPNY T.O REQUEST button on the INIT page or PERF page.

For more information about the:
- INIT page, *Refer to DSC-22-FMS-20-20-20 INIT Page*
- PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

COMPANY T.O REQUEST Button



When clicked, displays the COMPANY T.O DATA REQUEST page (*Refer to page*).

The COMPANY T.O DATA REQUEST page displays the data that are sent in the request message. The FMS automatically completes the data, based on the available flight plan and load data. The flight crew may always complete or change the takeoff request data:
- The departure airport
- The runway ident
- The takeoff weight
- The takeoff CG
- The environmental conditions:
  - Barometric reference
  - Wind
  - Runway state
  - Temperature
- The takeoff thrust rating
- The flaps setting
- The takeoff shift
- The takeoff limit
- Any free text.

The flight crew clicks on the SEND T.O REQUEST button to send the request.
After the flight crew sends the request, the button label changes to REQUEST PENDING... , until the flight plan data is received.

REQUEST PENDING Label

REQUEST
PENDING...

L2 If the FMS does not receive a response from the company ground station within 4 min after the request:

- The FMS message area displays the NO COMPANY REPLY message
- The associated buttons on the INIT page, PERF page, and COMPANY T.O DATA REQUEST page enable a new flight plan request.

Ident.: DSC-22-FMS-10-40-80-30-00004477.0001001 / 09 MAR 16

RECEIVED COMPANY TAKEOFF DATA

The FMS receives the takeoff data:

- In response to the flight crew request
- Directly, without previous request from the flight crew.

When the FMS receives the uplink, the MFD displays one of the following messages in the FMS message area:

- COMPANY T.O DATA RECEIVED WAITING FOR INSERTION
- L3 RECEIVED COMPANY T.O DATA NOT VALID: The takeoff data, uplinked from the company ground station, is not valid.

L1 The flight crew displays the received takeoff data by using the RECEIVED CPNY T.O button on INIT page or PERF page.

RECEIVED CPNY T.O Button

RECEIVED
CPNY T.O

When clicked, displays the RECEIVED COMPANY T.O DATA page (*Refer to page*).

The received takeoff data (for up to four different takeoff runways, and for up to two engine thrust ratings per runway) are:

- The takeoff runway
- The takeoff weight
- The takeoff CG

- The environmental conditions:
  - Barometric reference
  - Wind
  - Runway state
  - Temperature
- The takeoff speeds: V1, VR, V2
- The takeoff thrust rating
- The flaps setting
- The takeoff shift
- The takeoff limit
- The thrust reduction and acceleration altitudes
- The noise procedure parameters.

The flight crew can insert (or clear) this data by using the INSERT (or CLEAR) button. When inserted, the T.O panel of the PERF page is updated.

L2 The flight crew can insert the received takeoff data, only if the following conditions are achieved:
- The departure airport and runway correspond to the departure airport and runway of the active flight plan
- The takeoff weight is not more than 1 t (2.2 klb) below or 3 t (6.6 klb) above the takeoff weight on the FUEL&LOAD page
- The takeoff CG does not differ by more than 0.5 % from the takeoff CG on the ACTIVE/FUEL&LOAD page
- The following data are part of the received data: The takeoff speeds (V1, VR, V2), wind, runway state, barometric reference, and temperature.

Note: *1. If one of these conditions is not achieved, the flight crew cannot insert the uplinked data.*
2. If the condition on the takeoff weight is not achieved and the received runway corresponds to the active runway, the TOW value appears in amber on the RECEIVED COMPANY T.O DATA page, associated with the UPLINK/ACTIVE TOW DISAGREE label.

FLIGHT REPORTS

Applicable to: ALL

Ident.: DSC-22-FMS-10-40-80-40-00004470.0001001 / 14 APR 14

The FMS sends real-time flight reports to provide information about the aircraft current position and situation to the company ground station. There are four types of reports:
- Position report: Current aircraft position
- Progress report: Destination data

- F-PLN report: Active flight plan data
- Performance data report: Active performance data.

The flight crew can manually send the position and F-PLN reports.
The FMS can automatically send the position, progress, F-PLN, and performance data reports after specific events or in response to a ground request.

Ident.: DSC-22-FMS-10-40-80-40-00004478.0001001 / 14 APR 14

POSITION REPORT

The position report has the following information:
- Last sequenced waypoint with its related SAT, wind, and FOB
- TO waypoint
- NEXT waypoint
- Next cruise vertical profile change
- Destination with its related ETA, distance, and EFOB

The flight crew can display and send the position report on the POSITION/REPORT page (*Refer to page*).

Ident.: DSC-22-FMS-10-40-80-40-00004479.0001001 / 14 APR 14

PROGRESS REPORT

The progress report has the ETA and EFOB at destination.

The FMS automatically sends a progress report on a ground request, or if one of the following occurs:
- A change of the destination airport in flight
- A change of the destination runway in flight
- A specific event (optional):
  - X minutes to T/D
  - X minutes to destination
  - The ETA differs from the initial ETA by more than X minutes.

  The Operator defines X.

Ident.: DSC-22-FMS-10-40-80-40-00004480.0001001 / 14 APR 14

F-PLN REPORT

The F-PLN report has the following information:
- Company route
- Flight number
- Departure airport
- Takeoff runway
- Departure procedure

- En-route segment
- Destination airport
- Arrival procedure
- Approach procedure
- Destination runway
- Step.

The flight crew can send an F-PLN report by selecting CPNY F-PLN REPORT in the F-PLN INFO menu of the F-PLN page.
For more information about the COMPANY F-PLN REPORT page, *Refer to DSC-22-FMS-20-20-20 COMPANY F-PLN REPORT Page*.

Ident.: DSC-22-FMS-10-40-80-40-00004481.0001001 / 14 APR 14

PERFORMANCE DATA REPORT

The performance data report has the following information:
- Current GW
- Cruise flight level
- Current CG
- FOB
- Block fuel
- Route reserve
- CI, if the FMS speed mode (ECON/LRC) is ECON
- T/C temperature
- Climb transition altitude
- PERF factor
- Tropopause altitude
- Taxi fuel
- ZFW
- ZFWCG.

The FMS automatically sends a performance data report on a ground request.

BROADCAST DATA

Ident.: DSC-22-FMS-10-40-80-00004471.0001001 / 14 APR 14
Applicable to: ALL

The FMS automatically sends data to the company ground station. The FMS acts as an information provider without any flight crew action.

L2 The FMS automatically sends the following data:
- FMS identifier word (system address label)
- Flight number

- Active database
- Company route
- TO waypoint
- Wind direction and wind speed
- ZFW
- Block fuel
- FOB
- GW
- Destination runway
- Alternate airport
- ETA
- AP modes
- Flight phase
- Aircraft altitude and latitude/longitude
- Roll angle
- City-pair.

Intentionally left blank

Datalink with ATC Center

INTRODUCTION

Ident.: DSC-22-FMS-10-40-90-00004482.0001001 / 08 JUL 14
Applicable to: ALL

The ATC function of the FMS enables the flight crew to:
- Prepare and send flight plan clearance requests to an ATC center: *Refer to DSC-22-FMS-10-40-90 ATC F-PLN Clearance Request*
- Receive ATC flight plan clearances from an ATC center: *Refer to DSC-22-FMS-10-40-90 Received ATC F-PLN Clearance* .

To request or receive flight plan clearances, the ATC datalink system must be connected and notified to an ATC center. For more information, *Refer to DSC-46-ATC-10-10 Overview*.

The ATC flight plan clearances, requested or received, may have the following information:
- Departure:
  - Airport
  - Runway
  - Standard Instrument Departure (SID)
  - Departure Transition (TRANS)
- En-route segment:
  - Waypoints
  - Holding patterns
  - Speed constraints
  - Altitude constraints
  - Time constraints
  - Airways
- Arrival:
  - Arrival Transition (TRANS)
  - Standard Terminal Area Route (STAR)
  - Approach transition (VIA)
  - Final Approach (APPR)
  - Airport
  - Runway.

L2 In addition, the FMS automatically sends data (position, altitude, speed, etc.) to the ATC datalink system. This data is used for the:

- ATC reports:
  - Position report: *Refer to DSC-46-ATC-10-30 Position Report*
  - Modify report: *Refer to DSC-46-ATC-10-30 Modify*
  - Other reports: *Refer to DSC-46-ATC-10-30 Other Reports*.
- ATC confirm messages
- ADS-C function: *Refer to DSC-46-ATC-10-60 Automatic Dependent Surveillance - Contract (ADS-C)*.

Note: *For all automatically-sent ATC data, the FMS acts as an information provider without any flight crew action.*

ATC F-PLN CLEARANCE REQUEST

Ident.: DSC-22-FMS-10-40-90-00004483.0001001 / 14 APR 14
Applicable to: ALL

The flight crew can, during all the phases of flight, request an ATC F-PLN clearance:

- To initialize the flight plan
- To modify the flight plan.

To initialize an ATC F-PLN request, the flight crew will prepare the desired flight plan in the Secondary (SEC) flight plan 1(2)(3), and then transfer it to the mailbox.
For more information, *Refer to DSC-22-FMS-10-40-60 Active and Secondary Flight Plans*.
The flight crew sends the desired flight plan to the mailbox by clicking on the XFR TO MAILBOX button on the SEC INDEX page.

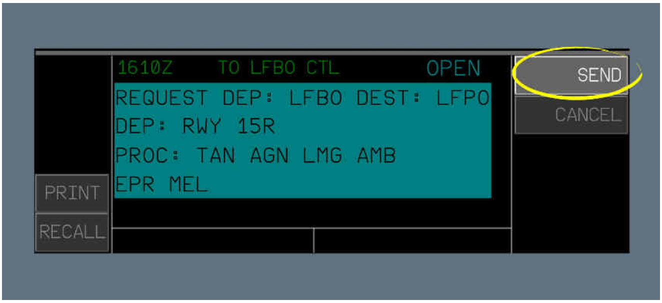
I02	MEL		

Then, the flight crew sends the ATC flight plan request to the ATC center by clicking on the SEND button on the mailbox.

SEND Button on the Mailbox



1610Z TO LFBO CTL OPEN

REQUEST DEP: LFBO DEST: LFPO
DEP: RWY 15R
PROC: TAN AGN LMG AMB
EPR MEL

Only one F-PLN clearance request can be loaded in the mailbox at a time.
L2 In addition, as soon as the request is transferred to the mailbox, the flight crew has 2 min to send the clearance request to the ATC center.

RECEIVED ATC F-PLN CLEARANCE

Ident.: DSC-22-FMS-10-40-90-00004484.0001001 / 03 JUL 20
Applicable to: ALL

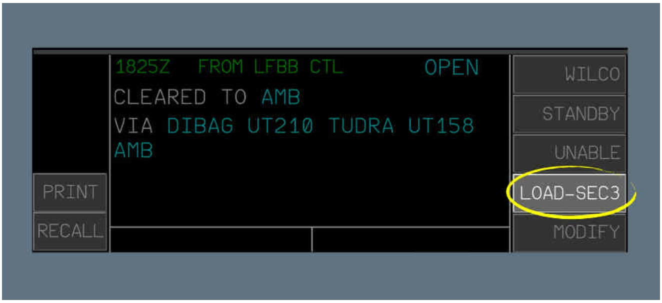
1 The ATC center may authorize the flight crew to fly a route by sending a loadable flight plan clearance:

- To initialize the flight plan
- To modify the flight plan.

When the flight crew receives the ATC F-PLN clearance in the mailbox, the flight crew can:

- copy the active flight plan to the third secondary flight plan (SEC 3) by clicking on the IMPORT/ ACTIVE button in SEC 3 on the FMS SEC INDEX Page.
L2 With the copy of the active flight plan, the FMS inserts in the SEC 3 the data listed in the FCOM. For more information, *Refer to DSC-22-FMS-10-40-60 Secondary Flight Plan Initialization*.
- L1 load the F-PLN clearance to the third secondary flight plan (SEC 3) by clicking on the mailbox LOAD→SEC3 button.

LOAD→SEC3 Button on the Mailbox



1825Z FROM LFBB CTL OPEN
CLEARED TO AMB
VIA DIBAG UT210 TUDRA UT158
AMB

L2 To load the ATC F-PLN clearance, the FMS automatically inserts the ATC F-PLN clearance into the third secondary flight plan (SEC 3) created as a copy from the active flight plan. When the clearance is a flight plan initialization, the FMS also copies all data from the ACTIVE/INIT and ACTIVE/FUEL&LOAD pages in SEC 3.

L1 Note: *If there is a flight plan in SEC 3, this flight plan will be deleted, when the ATC flight plan is uploaded.*
To prevent an inadvertent loss of a flight plan, the flight crew must copy SEC 3 flight plan in SEC 1(2), before the flight crew upload the ATC flight plan.

AMB

L1 When the received ATC F-PLN clearance is loaded in the FMS, one of the following messages appears in the FMS message area:

- ATC F-PLN INSERTED IN SEC 3: The received ATC F-PLN is loaded in the third secondary flight plan (SEC 3).

L2 The mailbox displays the LOADED IN SEC3 message (*Refer to message*).

L1 - ATC F-PLN INSERTED IN SEC 3 REJECTED INFO SEE SEC / INDEX: The received ATC F-PLN is partially loaded in the third secondary flight plan (SEC 3) due to not valid data sent by the ATC center.
The flight crew can check the rejected data on the REJECTED ATC INFO page (*Refer to page*).

L2 The mailbox displays the LOAD PARTIAL message (*Refer to message*).

L1 - RECEIVED ATC MSG NOT VALID: The FMS totally rejects the received ATC F-PLN because the data sent by the ATC center is not valid.
The flight crew can check the rejected data on the REJECTED ATC INFO page (*Refer to page*).

L2 The mailbox displays the LOAD REJECTED message (*Refer to message*).
Any data that was previously entered in SEC 3 is deleted.

Intentionally left blank

Overview

OVERVIEW

Ident.: DSC-22-FMS-10-50-10-00003580.0001001 / 23 APR 14
Applicable to: ALL

The performance function of the FMS:

- Computes a speed/Mach profile for each flight phase
  For the CLB, CRZ, and DES flight phases, the speed/Mach profile is based on the FMS speed mode (ECON/LRC).
- Computes the operating speeds for takeoff, approach, and go-around
- Computes the auto-derated thrust that the A/THR applies during climb
- Computes a descent path from the cruise flight level to the destination airport
- Computes the following flight levels:
  - The Optimum Flight Level (OPT FL)
  - The Recommended Maximum Flight Level (REC MAX FL)
- Enables the flight crew to fly a Noise Abatement Departure Procedure (NADP) with the NOISE function
- Uses the PERF factor, the IDLE factor, and the FUEL PENALTY factor to compute aircraft performance.

Note: *The FMS has an Engine-Out (EO) mode that enables the FMS to take an engine failure into account. For information about the computation of aircraft performance in the case of an engine failure, Refer to DSC-22-FMS-10-60 General.*

Intentionally left blank

FMS Speed Mode (ECON/LRC)

FMS SPEED MODE (ECON/LRC)

Ident.: DSC-22-FMS-10-50-20-00003581.0001001 / 06 MAY 14
Applicable to: ALL

For the CLB, CRZ, and DES flight phases, the FMS computes the optimum speed/Mach based on the FMS speed mode, as follows:

- When the FMS speed mode is LRC, the FMS computes the optimum speed/Mach that corresponds to the Long Range Cruise (LRC)
  In LRC mode, the optimum speed/Mach is referred to as the LRC speed/Mach.
- When the FMS speed mode is ECON, the FMS computes the optimum speed/Mach based on the Cost Index (CI).
  In ECON mode, the optimum speed/Mach is referred to as the ECON speed/Mach.

Note: *If the EO mode of the FMS is active, the FMS takes the engine failure into account to compute the optimum speed/Mach. Therefore:*
- *The LRC mode is referred to as the EO-LRC mode, and the optimum speed/Mach is referred to as the EO-LRC speed/Mach*
- *The ECON mode is referred to as the EO-ECON mode, and the optimum speed/Mach is referred to as the EO-ECON speed/Mach.*

L2 For more information about the optimum speed/Mach, *Refer to DSC-22-FMS-10-50-30 Speed/Mach Profiles*.

L1 The FMS also computes the Optimum Flight Level (OPT FL) based on the FMS speed mode.

L2 For more information about the OPT FL, *Refer to DSC-22-FMS-10-50-50 Optimum Flight Level (OPT FL)*.

L1 COST INDEX (CI)

The Operator uses the Cost Index (CI) to achieve minimum flight cost via a compromise between operating costs per hour (time cost) and fuel consumption per hour (fuel cost).
The CI is defined as follows:

$$CI = \frac{\text{Time Cost}}{\text{Fuel Cost}}$$

The CI can vary from 0 to 999:
- CI = 0 corresponds to the minimum fuel cost (maximum range)
- CI = 999 corresponds to the minimum time cost (minimum time).

The CI is often automatically associated with a company route.
The flight crew can also enter (or change) the CI manually. However, the flight crew cannot change the CI, when the DES, APPR, or GA flight phase is active.

At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
- Selects the LRC mode
- Sets the CI value to 0.

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-50-20-00003582.0002001 / 06 MAY 14
Applicable to: ALL

The flight crew can select the FMS speed mode, and enter (or change) the CI on:

ASSOCIATED MESSAGES

Ident.: DSC-22-FMS-10-50-20-00003583.0001001 / 23 APR 14
Applicable to: ALL

On the MFD, the FMS message area displays the following message: LRC MODE IN USE (*Refer to message*).

Flight Phases and Speed/Mach Profiles

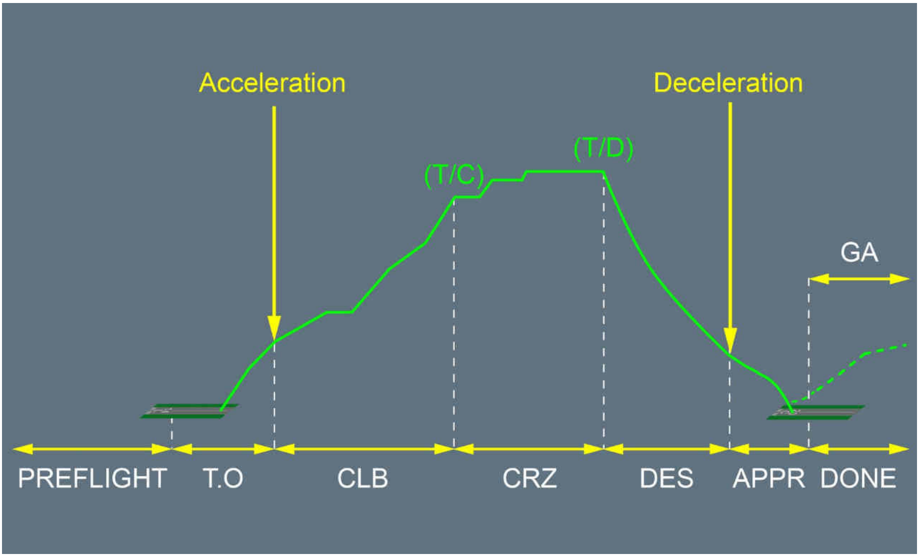
OVERVIEW

Ident.: DSC-22-FMS-10-50-30-00003584.0001001 / 05 MAY 14
Applicable to: ALL

The vertical flight plan is divided into 8 flight phases:
- PREFLIGHT
- Takeoff (T.O)
- Climb (CLB)
- Cruise (CRZ)
- Descent (DES)
- Approach (APPR)
- Go-Around (GA)
- DONE.

L2 *Note:* *The FMS flight phases are different and independent from the flight phases that other aircraft systems compute and use.*

FMS Flight Phases



L1 For each flight phase, the FMS computes the optimum speed/Mach profile. If the flight crew engages the managed speed/Mach control, the aircraft flies this speed/Mach profile.

The FMS changes from one flight phase to another, when the transition conditions are achieved.

L123

(2) *In the DONE flight phase, the FMS erases the data that was entered for the flight.*

FLIGHT PHASE TRANSITIONS

Applicable to: ALL

Ident.: DSC-22-FMS-10-50-30-10-00004070.0001001 / 23 APR 14

The FMS changes from one flight phase to another, when the transition conditions are achieved.

Ident.: DSC-22-FMS-10-50-30-10-00014697.0001001 / 23 APR 14

PREFLIGHT → T.O

The flight phase changes from PREFLIGHT to T.O, when:
- The SRS TO mode is engaged, and
- The current engine thrust is sufficient (50 % ≤ N3 ≤ 60 % for both engines), or the ground speed is above 90 kt.

Ident.: DSC-22-FMS-10-50-30-10-00014699.0001001 / 23 APR 14

T.O → CLB

The flight phase changes from T.O to CLB, when:
- The aircraft is at the acceleration attitude, or
- One of the following vertical modes engages: V/S, FPA, ALT*, ALT, ALT CST*, ALT CST, CLB, OP CLB, DES or OP DES.

Ident.: DSC-22-FMS-10-50-30-10-00004499.0001001 / 23 APR 14

CLB → CRZ

The flight phase changes from CLB to CRZ, when the aircraft reaches the cruise flight level (the ALT CRZ* or ALT CRZ mode engages).

Ident.: DSC-22-FMS-10-50-30-10-00004497.0001001 / 23 APR 14

CLB → APPR

The flight phase changes from CLB to APPR, if the flight crew activates the APPR flight phase via the ACTIVATE APPR button on the PERF page (*Refer to page*).

Ident.: DSC-22-FMS-10-50-30-10-00004069.0001001 / 07 MAY 18

L3 CLB → DES

The flight phase changes from CLB to DES, if all of the following occur:
- There is no destination, or the distance to destination (along the flight plan) is equal to or less than 200 NM, or the selected altitude target is equal to or below the highest of the following:
  - FL 200
  - the highest descent altitude constraint.
- The selected altitude target is equal to or below the cruise flight level, and
- One of the following occurs:
  - DES or OP DES is engaged, or
  - V/S or FPA is engaged, and the selected altitude target is equal to or below the current aircraft altitude.

Ident.: DSC-22-FMS-10-50-30-10-00013665.0001001 / 23 APR 14

L3 CLB → GA

The flight phase changes from CLB to GA, if the SRS GA mode engages.

Ident.: DSC-22-FMS-10-50-30-10-00000327.0001001 / 07 MAY 18

CRZ → DES

The flight phase changes from CRZ to DES, if all of the following occur:

- The flight plan has no step descent ahead of the aircraft
- The distance to the destination airport (along the flight plan) is equal to or less than 200 NM, or the selected altitude target is equal to or below the highest of the following:
  - FL 200
  - the highest descent altitude constraint.
- The selected altitude target is equal to or below the cruise flight level, and
- One of the following occurs:
  - DES or OP DES is engaged, or
  - APP-DES is engaged, or
  - V/S or FPA is engaged, and the selected altitude target is equal to or below the current aircraft altitude.

Ident.: DSC-22-FMS-10-50-30-10-00000326.0001001 / 23 APR 14

CRZ → APPR

The flight phase changes from CRZ to APPR, if:

- The NAV mode is engaged, and the aircraft sequences the DECEL pseudo waypoint, or
- The flight crew activates the APPR flight phase via the ACTIVATE APPR button on the PERF page (*Refer to page*).

Ident.: DSC-22-FMS-10-50-30-10-00000325.0001001 / 23 APR 14

L3 CRZ → GA

The flight phase changes from CRZ to GA, if the SRS GA mode engages.

Ident.: DSC-22-FMS-10-50-30-10-00000324.0001001 / 23 APR 14

DES → APPR

The flight phase changes from DES to APPR, when:

- The NAV, LOC*, LOC, F-LOC*, or F-LOC mode is engaged, and the aircraft sequences the DECEL pseudo waypoint, or
- The flight crew activates the APPR flight phase via the ACTIVATE APPR button on the PERF page (*Refer to page*).

Ident.: DSC-22-FMS-10-50-30-10-00014701.0001001 / 23 APR 14

L2 DES → CRZ

The flight phase changes from DES to CRZ, if all of the following occur:

- The flight crew defines a new cruise flight level on the PERF page (*Refer to page*)
- The aircraft altitude is above the cruise flight level.

Ident.: DSC-22-FMS-10-50-30-10-00014703.0001001 / 23 APR 14

L3 DES → GA

The flight phase changes from DES to GA, if the SRS GA mode engages.

Ident.: DSC-22-FMS-10-50-30-10-00014704.0001001 / 23 APR 14

L3 DES → CLB

The flight phase changes from DES to CLB, if all of the following occur:

- The flight crew defines a new cruise flight level on the PERF page (*Refer to page*)
- The aircraft altitude is below the cruise flight level.

Ident.: DSC-22-FMS-10-50-30-10-00005554.0001001 / 02 OCT 14

APPR → DONE

The flight phase changes from APPR to DONE 30 s after landing.

Ident.: DSC-22-FMS-10-50-30-10-00005555.0001001 / 23 APR 14

APPR → GA

The flight phase changes from APPR to GA, if the SRS GA mode engages.

Ident.: DSC-22-FMS-10-50-30-10-00005556.0001001 / 23 APR 14

L3 APPR → CLB

The flight phase changes from APPR to CLB, if all of the following occur:

- The flight crew defines a new cruise flight level on the PERF page (*Refer to page*)
- The aircraft altitude is below the cruise flight level.

Ident.: DSC-22-FMS-10-50-30-10-00005557.0001001 / 23 APR 14

L3 APPR → CRZ

The flight phase changes from APPR to CRZ, if all of the following occur:

- The flight crew defines a new cruise flight level on the PERF page (*Refer to page*)
- The aircraft altitude is equal to or above the cruise flight level.

Ident.: DSC-22-FMS-10-50-30-10-00005558.0001001 / 23 APR 14

GA → CLB

The flight phase changes from GA to CLB, when:

- The aircraft is at the go-around acceleration altitude, or
- One of the following vertical modes engages: V/S, FPA, ALT*, ALT, ALT CST*, ALT CST, CLB, OP CLB, DES or OP DES.

Ident.: DSC-22-FMS-10-50-30-10-00005559.0001001 / 23 APR 14

GA → APPR

The flight phase changes from GA to APPR, if the flight crew activates the APPR flight phase via the ACTIVATE APPR button on the PERF page (*Refer to page*).

Ident.: DSC-22-FMS-10-50-30-10-00005560.0001001 / 23 APR 14

L3 ANY FLIGHT PHASE (EXCEPT PREFLIGHT AND APPR) → DONE

The flight phase changes from T.O, CLB, CRZ, DES, or GA to DONE, if all of the following occur:

- The aircraft is on ground for 30 s
- All engines are off.

Ident.: DSC-22-FMS-10-50-30-10-00005561.0001001 / 23 APR 14

DONE → PREFLIGHT

The flight phase changes from DONE to PREFLIGHT, when:

- The flight crew displays the ACTIVE/INIT, ACTIVE/FUEL&LOAD, or ACTIVE/PERF page, or
- In order to initialize the flight plan, the flight crew:
  - Activates a secondary flight plan with the SWAP function, or
  - Inserts a company flight plan received via datalink.

Ident.: DSC-22-FMS-10-50-30-10-00005553.0001001 / 23 APR 14

L3 DONE → T.O

The flight phase changes from DONE to T.O, if:

- The SRS TO mode is engaged, and
- The current engine thrust is sufficient (50 % ≤ N3 ≤ 60 % for both engines), or the ground speed is above 90 kt.

SPEED/MACH PROFILES

Applicable to: ALL

Ident.: DSC-22-FMS-10-50-30-20-00003585.0001001 / 23 APR 14

For each flight phase, the FMS computes the optimum speed/Mach profile. If the flight crew engages the managed speed/Mach control, the aircraft flies this speed/Mach profile.

Ident.: DSC-22-FMS-10-50-30-20-00003586.0001001 / 23 APR 14

T.O

OPERATING SPEEDS

The FMS computes the following operating speeds for takeoff:

- F
  F is the minimum recommended speed at which the flaps may be retracted from CONF 2 or CONF 3 to CONF 1+F.
- S
  S is the minimum recommended speed at which the slats may be retracted from CONF 1+F or CONF 1 to CONF 0.
- GDOT.
  GDOT is the final takeoff speed.
  GDOT is an optimized speed. It is an approximation of the best lift to drag ratio. Flying at GDOT provides the best climb performance.

The T.O panel of the PERF page displays the operating speeds that the FMS computes for takeoff.

L2 For more information about the PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

L1 During the PREFLIGHT flight phase, the FMS uses the estimated weight and CG to compute the operating speeds. During the T.O flight phase, the FMS uses the current weight and CG.

L12

Note: *The PRIMs always use the current weight and CG to compute the operating speeds that are displayed on the PFD. Therefore, during the PREFLIGHT flight phase, the operating speeds that are displayed on the PFD may be different from the operating speeds that are displayed on the T.O panel of the PERF page.*

For more information about the speeds that the PRIMs compute:

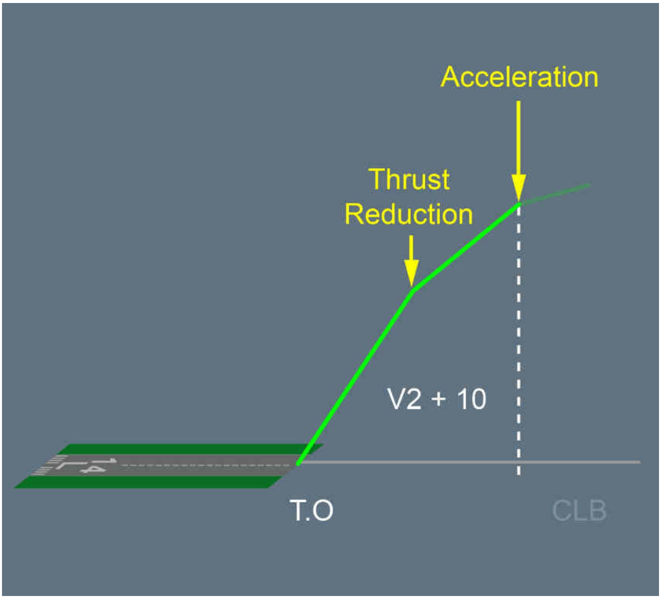
- *For F, Refer to DSC-22-27-10-20 F*
- *For S, Refer to DSC-22-27-10-20 S*
- *For GDOT, Refer to DSC-22-27-10-20 GREEN DOT.*

MANAGED SPEED PROFILE

From liftoff to the acceleration altitude, the managed speed target is V2 + 10 kt.

Note: *The magenta triangle on the PFD airspeed scale indicates V2. However, the managed speed target is V2 + 10 kt.*

Managed Speed Profile during T.O



Ident.: DSC-22-FMS-10-50-30-20-00003587.0001001 / 23 APR 14

CLB

OPTIMIZED SPEED/MACH

The FMS computes an optimized speed/Mach. The optimized speed/Mach is:
- The ECON speed/Mach, when the FMS speed mode is ECON
- The LRC speed/Mach, when the FMS speed mode is LRC.

For the CLB flight phase, the FMS computes the optimized speed/Mach based on:
- The cost index, if the FMS speed mode is ECON
- The aircraft gross weight
- The cruise flight level

- The wind and temperature data
- A time constraint, if any.

L2 For more information about the time constraint revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

L1 If a time constraint is defined in the flight plan, the optimized speed/Mach is referred to as the RTA speed/Mach.

L3 The optimized speed/Mach is limited by the following operational speed envelope:

- Minimum speed = MAX (VLS, GDOT)
- Maximum speed = MIN (MMO-ΔMMO, VMO-ΔVMO, Mach[0.3 g buffet margin]).

L1 The CLB panel of the PERF page displays the ECON, LRC, and RTA speed/Mach for the CLB flight phase.

L2 For more information about the PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

L1 MANAGED SPEED/MACH PROFILE

If a climb speed limit (or a climb speed constraint) is defined in the flight plan, the managed speed/Mach target is:

- The speed limit (or the speed constraint), from the acceleration altitude to the speed limit altitude (or the speed constraint waypoint)
- The optimized speed/Mach (ECON, LRC, or RTA), from the speed limit altitude (or the speed constraint waypoint) to the T/C.

L3 The aircraft flies at the optimized speed until the crossover altitude. Between the crossover altitude and the T/C, the aircraft flies at the optimized Mach. The crossover altitude is the altitude at which the optimized speed and the optimized Mach correspond to the same TAS.

L1 The CLB panel of the PERF page displays the climb speed limit (or the climb speed constraint), if any.

L2 For more information about:

- The SPD LIMIT revision, *Refer to DSC-22-FMS-10-40-30 Purpose*
- The SPD CSTR revision, *Refer to DSC-22-FMS-10-40-30 Purpose*

L1 If no climb speed limit and no climb speed constraint are defined in the flight plan, the managed speed/Mach target, from the acceleration altitude and to the T/C, is the optimized speed/Mach (ECON, LRC, or RTA).

CRZ

OPTIMIZED SPEED/MACH

The FMS computes an optimized speed/Mach. The optimized speed/Mach is:

- The ECON speed/Mach, when the FMS speed mode is ECON
- The LRC speed/Mach, when the FMS speed mode is LRC.

For the CRZ flight phase, the FMS computes the optimized Mach/speed based on:

- The cost index, if the FMS speed mode is ECON
- The aircraft gross weight
- The cruise flight level

- The wind and temperature data
- A time constraint, if any.

L2 For more information about the time constraint revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

L1 If a time constraint is defined in the flight plan, the optimized speed/Mach is referred to as the RTA speed/Mach.

L2 The FMS computes:
- A cruise Mach, when the cruise flight level is at or above FL 250
- A cruise speed, when the cruise flight level is below FL 250.

L3 The optimized speed/Mach is limited by the following operational speed envelope:
- Minimum speed = MAX (VLS, GDOT)
- Maximum speed = MIN (MMO-ΔMMO, VMO-ΔVMO, Mach[0.3 g buffet margin], Mach[Thrust limitation]).

L1 The CRZ panel of the PERF page displays the ECON, LRC, and RTA speed/Mach for the CRZ flight phase.

L2 For more information about the PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

L1 MAXIMUM TURBULENCE (MAX TURB) SPEED/MACH

For the CRZ flight phase, the FMS computes the Maximum Turbulence (MAX TURB) speed/Mach.
The MAX TURB speed/Mach is the maximum speed/Mach to safely fly in a turbulent atmosphere.
The MAX TURB speed/Mach is a protection against both inadvertent stall and structural damage.

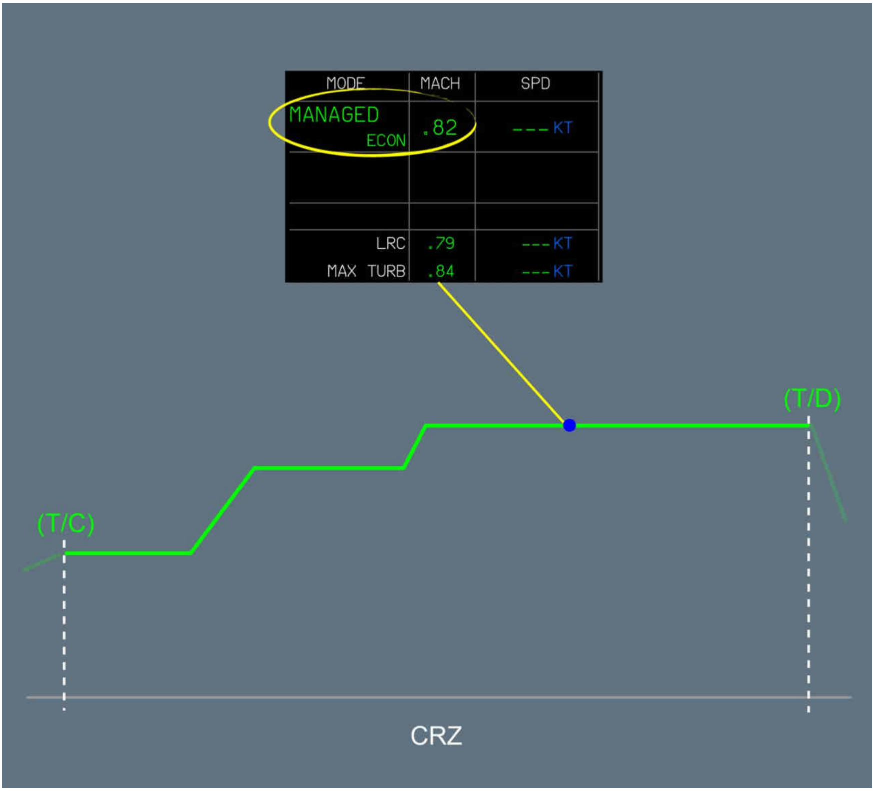
The MAX TURB speed/Mach depends on:
- The aircraft gross weight
- The altitude.

The CRZ panel of the PERF page displays the MAX TURB speed/Mach.
To fly this speed, the flight crew selects the MAX TURB Mach on the AFS CP, and engages the manual speed control.

MANAGED SPEED/MACH PROFILE

If no Constant Mach Segment (CMS) is defined in the flight plan, the managed speed/Mach target, from the T/C to the T/D, is the optimized speed/Mach (ECON, LRC, or RTA).

Managed Speed/Mach Profile during CRZ



If a CMS is defined in the flight plan, the managed speed target is:

- The Mach defined by the flight crew, when the aircraft flies the CMS
  If the aircraft flies a CMS, the speed mode table of the PERF page displays the CMS label to indicate that there is a CMS. A CMS has priority over a time constraint.
  L2 For more information about the CMS revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.
- L1 The optimized speed/Mach (ECON, LRC, or RTA), when the aircraft is out of the CMS.

DES

OPTIMIZED SPEED/MACH

The FMS computes an optimized speed/Mach. The optimized speed/Mach is:
- The ECON speed/Mach, when the FMS speed mode is ECON
- The LRC speed/Mach, when the FMS speed mode is LRC.

For the DES flight phase, the FMS computes the optimized Mach/speed based on:
- The cost index, if the FMS speed mode is ECON
- The aircraft gross weight at the T/D
- The cruise flight level

- The wind and temperature data
- A time constraint, if any.

L2 For more information about the time constraint revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

L1 If a time constraint is defined in the flight plan, the optimized speed/Mach is referred to as the RTA speed/Mach.

L3 The optimized speed/Mach is limited by the following operational speed envelope:
- Minimum speed = MAX (VLS, GDOT)
- Maximum speed = MIN (MMO-ΔMMO, VMO-ΔVMO, Mach[0.3 g buffet margin]).

L1 The DES panel of the PERF page displays the ECON, LRC, and RTA speed/Mach for the DES flight phase.

L2 For more information about the PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

OPTIMIZED DESCENT PATH

The FMS computes the descent path in order to minimize the fuel consumption, and to reach VAPP at 1 000 ft AGL.

The computed descent path:
- Complies with the altitude constraints
- Complies with the descent speed/Mach profile
- Is based on:
  - The data of the lateral and vertical flight plans
  - The descent and approach winds
  - The maximum cabin descent rate.

During the DES flight phase, the FMS updates the descent path, if the flight crew changes the flight plan or any approach data (approach wind, VAPP, or landing configuration).

Note: *The descent path computation does not take into account the position of the speed brakes.*

L1 MANAGED SPEED/MACH PROFILE

Before the DES flight phase becomes active, the flight crew can preset the managed speed/Mach target for the descent via the PERF page. In this case, the FMS will not update the speed/Mach during the DES flight phase, when the flight conditions change.
If the flight crew does not preset a managed speed/Mach target, the FMS computes a default value for the managed speed/Mach target.

If a descent speed limit (or descent speed constraint) is defined in the flight plan, the default value of the managed speed/Mach target is:

- The optimized speed/Mach (ECON, LRC, or RTA, from the T/D to the speed limit altitude (or the speed constraint waypoint)

  L3 The aircraft flies at the optimized Mach until the crossover altitude. Between the crossover altitude and the DECEL pseudo waypoint, the aircraft flies at the optimized speed. The crossover altitude is the altitude at which the optimized speed and the optimized Mach correspond to the same TAS.
- L1 The speed limit (or the speed constraint), from the speed limit altitude (or the speed constraint waypoint) to the DECEL pseudo waypoint.

The DES panel of the PERF page displays the descent speed limit (or the descent speed constraint), if any.

L2 For more information about:

- The SPD LIMIT revision, *Refer to DSC-22-FMS-10-40-30 Purpose*
- The SPD CSTR revision, *Refer to DSC-22-FMS-10-40-30 Purpose*

L1 If no descent speed limit and no descent speed constraint are defined in the flight plan, the default value of the managed speed/Mach target, from the T/D to the DECEL pseudo waypoint, is the optimized speed/Mach (ECON, LRC, or RTA).

APPR

REFERENCE AND OPERATING SPEEDS

The FMS computes the following speeds for approach:
- GDOT, S, and F
- VLS of the selected landing configuration

- VAPP
- VREF.

The APPR panel of the PERF page displays these speeds.

L2 For more information about the PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

L1 GDOT, S, and F

The FMS computes the following operating speeds for approach:
- GDOT
  GDOT is the managed speed target, when in CONF 0.
  GDOT is an optimized speed. It is an approximation of the best lift to drag ratio. Flying at GDOT provides the best climb performance.
- S
  S is the managed speed target, when in CONF 1 or CONF 1+F.
- F.
  F is the managed speed target, when in CONF 2 or CONF 3.

Before the APPR flight phase is active, the FMS uses the estimated landing weight and CG to compute the operating speeds. When the APPR flight phase is active, the FMS uses the current GW and CG.

L3 The FMS receives the current GW and CG from the FQMS.

L12

Note: *The PRIMs always use the current weight and CG to compute the operating speeds that are displayed on the PFD. Therefore, before the APPR flight phase is active, the operating speeds that are displayed on the PFD may be different from the operating speeds that are displayed on the APPR panel of the PERF page.*

For more information about the speeds that the PRIMs compute:
- *For F, Refer to DSC-22-27-10-20 F*
- *For S, Refer to DSC-22-27-10-20 S*
- *For GDOT, Refer to DSC-22-27-10-20 GREEN DOT.*

L1 VLS

VLS is the lowest selectable speed for the selected landing configuration.

VLS depends on:
- The selected landing configuration (The FMS computes VLS for CONF 3 or CONF FULL)
- The landing weight and CG
- The destination airport elevation.

Before the APPR flight phase is active, the FMS uses the estimated landing weight and CG to compute VLS. When the APPR flight phase is active, the FMS uses the current weight and CG.

L3 The FMS receives the current GW and CG from the FQMS.

L12

Note: *The PRIMs use the current weight, CG, flaps configuration, and altitude to compute the VLS that is displayed on the PFD. Therefore, the VLS that is displayed on the PFD may be different from the VLS that is displayed on the APPR panel of the PERF page.*
For more information about the VLS that the PRIMs compute, Refer to DSC-22-27-10-20 VLS.

L1 VAPP

VAPP is the final approach speed.
VAPP is the managed speed target, when in the approach configuration (CONF 3 or CONF FULL).

To compute a default VAPP, the FMS takes into account:
- VLS, that depends on the selected landing configuration
- The wind at the destination airport.

The flight crew can always overwrite the default value.

VREF

VREF is the reference speed for normal approach and landing.
This speed is used to compute the regulatory landing performance of the aircraft.
The flight crew also uses this speed to compute landing performance with failures.

L2 VREF is equal to the VLS of CONF FULL.

L1 MANAGED SPEED PROFILE

During the APPR flight phase, the managed speed target is VAPP.

However, the flight guidance uses the short-term managed speed as the current speed target, as follows:
- When the aircraft sequences the DECEL pseudo waypoint or when the flight crew manually activates the APPR flight phase, the short-term managed speed is GDOT
  The aircraft decelerates from the descent speed to GDOT.
- When the flight crew selects FLAPS 1, the short-term managed speed becomes the S speed
  The aircraft decelerates from GDOT to S,
- When the flight crew selects FLAPS 2, the short-term managed speed becomes the F speed
  The aircraft decelerates from S to F.

- When the flight crew selects FLAPS 3:
    - If the landing flaps setting is CONF FULL, the short-term managed speed becomes the F speed for CONF 3
      The aircraft decelerates from F for CONF 2 to F for CONF 3.
    - If the landing flaps setting is CONF 3, the aircraft decelerates from F to VAPP.
- When the flight crew selects FLAPS FULL, the aircraft decelerates from F to VAPP.

GA

OPERATING SPEEDS

The FMS computes the following operating speeds for go-around:
- F
  F is the minimum recommended speed at which the flaps may be retracted from CONF 2 or 3 to CONF 1+F.
- S
  S is the minimum recommended speed at which the slaps may be retracted from CONF 1+F or CONF 1 to CONF 0.
- GDOT.
  GDOT is an optimized speed. It is an approximation of the best lift to drag ratio. Flying at GDOT provides the best climb performance.

The GA panel of the PERF page displays these speeds.

L2 For more information about the PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

L1 Before the APPR flight phase is active, the FMS uses the estimated landing weight and CG to compute the operating speeds. When the APPR or GA flight phase is active, the FMS uses the current GW and CG.

L3 The FMS receives the current GW and CG from the FQMS.

L12

Note: *The PRIMs always use the current weight and CG to compute the operating speeds that are displayed on the PFD. Therefore, before the APPR flight phase is active, the operating speeds that are displayed on the PFD may be different from the operating speeds that are displayed on the GA panel of the PERF page.*

For more information about the speeds that the PRIMs compute:
- *For F, Refer to DSC-22-27-10-20 F*
- *For S, Refer to DSC-22-27-10-20 S*
- *For GDOT, Refer to DSC-22-27-10-20 GREEN DOT.*

L1 MANAGED SPEED PROFILE

During the GA flight phase, the managed speed target is the speed at which the aircraft flied, when the GA flight phase became active.
The lower limit of the managed speed target is VAPP.

Optimum Flight Level and Recommended Maximum Flight Level

OPTIMUM FLIGHT LEVEL

Ident.: DSC-22-FMS-10-50-50-00003592.0001001 / 23 APR 14
Applicable to: ALL

The FMS computes the Optimum Flight Level (OPT FL).
The OPT FL is the flight level at which the fuel consumption is the lowest.

The computation of the OPT FL is based on:
- The aircraft gross weight
- The FMS speed mode (ECON/LRC)
- The CI, if the FMS speed mode is ECON
- The temperature and winds
- L2 The following assumption: The engine anti-ice and the wing anti-ice are off
- L1 A minimum cruise time of 5 min at the OPT FL.

The computation does not take into account any Constant Mach Segment (CMS).
The FMS computes the OPT FL, until the aircraft is at 5 min before the T/D.
The FMS does not computes the OPT FL, if the EO mode is active.
The PERF page displays the current OPT FL.

RECOMMENDED MAXIMUM FLIGHT LEVEL (REC MAX FL)

Ident.: DSC-22-FMS-10-50-50-00003593.0001001 / 23 APR 14
Applicable to: ALL

The FMS computes the Recommended Maximum Flight Level (REC MAX FL).

At the REC MAX FL, the aircraft:
- Can fly at a speed between GDOT and VMO/MMO
- Can keep a thrust rating, without acceleration, that is less than the maximum thrust for the cruise
- Has a buffeting margin of 0.3 g.

The aircraft can reach the REC MAX FL with a minimum vertical speed of 300 ft/min at the maximum CLB thrust.

The computation of the REC MAX FL is based on:
- The current gross weight of the aircraft
- L2 The following assumption: The engine anti-ice and the wing anti-ice are off
- L1 The delta ISA.

L3 The vertical profile of the delta ISA is defined by the CRZ FL, the CRZ TEMP, and the TROPO that are entered on the INIT page. In cruise, the vertical profile of the delta ISA is corrected by the measured temperature.

L2 The FMS message area displays:
- The CRZ FL ABOVE MAX FL message, if the flight crew enters a cruise flight level that is above the REC MAX FL
- The STEP ABOVE MAX FL message, if the flight crew enters a step altitude that is above the REC MAX FL.

L1 The PERF page displays the current REC MAX FL.

NOISE Function

INTRODUCTION

Ident.: DSC-22-FMS-10-50-60-00003594.0001001 / 23 APR 14
Applicable to: ALL

The NOISE function of the FMS enables the flight crew to perform an optimized Noise Abatement Departure Procedure (NADP) with the managed speed/Mach control.
The flight crew uses the NOISE function, if the Operator defines specific parameters (i.e. the NOISE END altitude, the NOISE thrust, and the NOISE speed) for the NADP.

There are two types of NADP:
- A **close-in** NADP is a departure procedure that aims to reduce noise levels near to the airport During this procedure, the flight crew performs a thrust reduction either at or above the published minimum altitude, and delays the retraction of the slats/flaps. However, the retraction of the slats/flaps still occurs before the published maximum altitude.
- A **distant** NADP is a departure procedure that aims to reduce noise levels far from the airport. During this procedure, the flight crew retracts the slats/flaps, and then reduces the thrust. With this procedure, the thrust reduction altitude is above the acceleration altitude.

The NOISE function enables the flight crew to perform both types of NADP.
An NADP that the flight crew performs with the NOISE function is referred to as a NOISE procedure.

NOISE PARAMETERS AND NOISE PROFILE

Applicable to: ALL

Ident.: DSC-22-FMS-10-50-60-10-00016841.0001001 / 23 APR 14

The vertical profile of the NOISE procedure is referred to as the NOISE profile.

The FMS computes the NOISE profile based on the following parameters:
- The thrust reduction altitude
- The acceleration altitude
- The NOISE parameters.

  The NOISE parameters are:
  - The NOISE END altitude
  - The NOISE thrust
  - The NOISE speed.

Ident.: DSC-22-FMS-10-50-60-10-00003595.0001001 / 23 APR 14

NOISE PARAMETERS

The flight crew enters the thrust reduction altitude, the acceleration altitude, and the NOISE parameters in the dedicated entry fields on the T.O or CLB panel of the PERF page.

L2 For more information about the PERF page (*Refer to DSC-22-FMS-20-20-20 PERF Page*).

NOISE END Altitude
Acceleration Altitude
NOISE Speed

L1 THRUST REDUCTION ALTITUDE

The thrust reduction altitude is the altitude at which the flight crew should reduce the thrust from TOGA, FLX, or DTO, to CLB or DCLB.
In the case of a NOISE procedure, at the thrust reduction altitude, the thrust target changes from TOGA, FLX, or DTO thrust to NOISE thrust.

The default value for the thrust reduction altitude is:
- The value that is associated with the departure airport, and that is stored in the navigation database, or
- The value that is the sum of:
  - The departure airport elevation (stored in the navigation database)
  - The thrust reduction height (defined by the Operator in the AMI file).
    The default value for the thrust reduction height is 1 500 ft.

The flight crew can always overwrite the default value.

ACCELERATION ALTITUDE

The acceleration altitude is the altitude at which the aircraft accelerates toward the NOISE speed.

The default value for the acceleration altitude is:
- The value that is associated with the departure airport, and that is stored in the navigation database, or
- The value that is sum of:
  - The departure airport elevation (stored in the navigation database)
  - The acceleration height (defined by the Operator in the AMI file).
    The default value for the acceleration height is 1 500 ft.

The flight crew can always overwrite the default value.

NOISE END ALTITUDE

The NOISE END altitude is the altitude at which the noise restrictions no longer apply. Below the NOISE END altitude, a speed restriction and a thrust restriction may apply.
At the NOISE END altitude, the thrust target automatically changes from NOISE thrust to CLB or DCLB thrust.
The transition from NOISE thrust to CLB or DCLB thrust is a smooth transition with a thrust gradient of 0.2 % N1 per second. This thrust transition is referred to as the thrust ramp. During the thrust ramp, the aircraft still flies at the NOISE speed.
If the flight crew does not enter the NOISE END altitude, the FMS does not compute the NOISE profile.

NOISE THRUST

The NOISE thrust is the thrust target (in percentage of N1) that the A/THR applies between the thrust reduction altitude and the NOISE END altitude.
The lowest noise thrust that is acceptable is 40 % N1.
If the flight crew does not enter the NOISE thrust, the CLB thrust will apply.
If the flight crew did not previously enter the NOISE END altitude in the NOISE END entry field, the flight crew cannot enter the NOISE thrust.

NOISE SPEED

The NOISE speed is the managed speed target that applies between the acceleration altitude and the end of the thrust ramp.
After the flight crew enters a NOISE END altitude, the FMS computes a default NOISE speed.

The default NOISE speed is the highest of the following two values:
- S + 15 kt
  S is the minimum recommended speed at which the flight crew can retract the slats.
- VLS + 10 kt.
  VLS is the lowest speed that the flight crew can select in clean configuration at the NOISE END altitude.

Note: *The default NOISE speed may be less than GDOT speed.*

The flight crew can always overwrite the default value.
If the flight crew did not previously enter the NOISE END altitude in the NOISE END entry field, the FMS does not compute the default NOISE speed, and the flight crew cannot enter the NOISE speed.

Ident.: DSC-22-FMS-10-50-60-10-00003597.0001001 / 23 APR 14

NOISE PROFILE

The FMS computes the NOISE profile, as soon as the flight crew enters:
- The NOISE END altitude and the NOISE speed, or
- The NOISE END altitude and the NOISE thrust.

L2 If the flight crew does not enter the NOISE END altitude, the FMS does not compute the NOISE profile.
If the flight crew enters the NOISE END altitude and the NOISE speed, but not the NOISE thrust, the FMS computes the NOISE profile based on the maximum CLB thrust.
If the flight crew enters the NOISE END altitude and the NOISE thrust, but not the NOISE speed, the FMS computes the NOISE profile based on the ECON/LRC climb speed.
The following description is based on the assumption that the flight crew enters all NOISE parameters.

L1 The flight crew can change the NOISE parameters, until the aircraft reaches the NOISE END altitude.

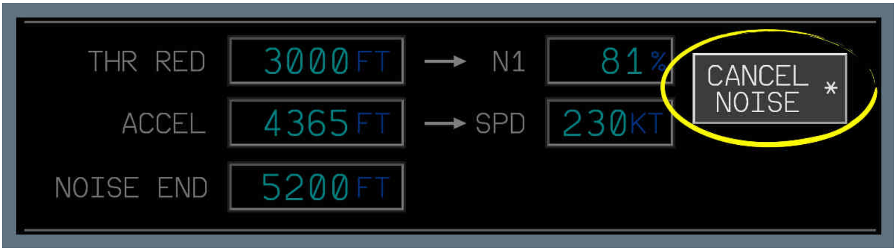
END OF THE NOISE PROCEDURE

The NOISE procedure ends at the end of the thrust ramp.
The flight crew can always manually cancel the NOISE procedure. To cancel the NOISE procedure, the flight crew clicks on the CANCEL NOISE button on the T.O or CLB panel of the PERF page.
The FMS may also automatically cancel the NOISE procedure.

CANCEL NOISE Button



L2 For more information about the PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

L1 After the NOISE procedure ends or is canceled:

- The thrust target reverts to:
  - The climb thrust (CLB or DCLB), if the aircraft is above the thrust reduction altitude
  - The takeoff thrust (TOGA, FLX, or DTO), if the aircraft is below the thrust reduction altitude
- The managed speed target reverts to:
  - The climb speed (ECON or LRC), if the aircraft is above the acceleration altitude
  - V2 + 10 kt, if the aircraft is below the acceleration altitude.

Note: *In flight, after the NOISE procedure is canceled, the flight crew cannot reactivate the NOISE procedure.*

NOISE PROCEDURE AND ENGINE-OUT

If the Engine-Out (EO) mode of the FMS becomes active, the FMS automatically cancels the NOISE procedure.

L2 NOISE PROCEDURE AND FLIGHT GUIDANCE MODES

The NOISE profile is part of the FMS climb profile. As a result, if the flight crew engages a selected guidance mode, the guidance rules, as described in the Flight Guidance chapter, apply.

Some examples:

- If the flight crew disconnects the A/THR while the flight crew performs the NOISE procedure, the NOISE thrust is disregarded. However, the managed speed target is still the NOISE speed. If the flight crew activates the A/THR again, the thrust target becomes the NOISE thrust.
- If the V/S / FPA mode engages, the NOISE thrust is disregarded. The THRUST mode changes to SPEED mode in order to reach the managed speed target that is still the NOISE speed.
- If the flight crew activates the selected speed/Mach control, the NOISE speed is disregarded. However, the thrust target is still the NOISE thrust. If the flight crew activates the managed speed/Mach control again, the managed speed target becomes the NOISE speed.

  Note: *If the flight crew previously preset a selected speed on the CLB panel of the PERF page, the selected speed/Mach control automatically engages at the acceleration altitude. In this case, the aircraft will fly at the selected speed between the acceleration altitude and the NOISE END altitude. The thrust target is still the NOISE thrust.*

If the V/S or ALT mode engages while the aircraft flies the thrust ramp, the FMS cancels the NOISE procedure, and the flight crew cannot reactivate the NOISE procedure.

PERF Factor, IDLE Factor, and FUEL PENALTY Factor

PERF FACTOR AND IDLE FACTOR

Ident.: DSC-22-FMS-10-50-70-00003599.0001001 / 03 JUL 14
Applicable to: ALL

The IDLE factor and the PERF factor are correction factors that the FMS uses to compute the aircraft performance and the flight plan predictions.
The PERF factor is a correction factor of the fuel flow. The FMS takes the PERF factor into account to compute the managed speed/Mach profile, the optimum flight level, and the predictions.
The IDLE factor is a correction factor of the idle engine rating. The FMS takes the IDLE factor into account to compute the path for the descent and the approach, and to compute predictions.

The IDLE factor and the PERF factor are updated at the discretion of the Operator, as necessary:
- The Operator should define and apply the IDLE factor, if the computation of the path for the descent and the approach needs to be modified
- The Operator should define and apply the PERF factor, if there is any degradation in aerodynamic performance or engine performance.

L2 The Operator can define a default value for both factors in the AMI file.
L1 The IDLE factor and the PERF factor can be automatically changed via datalink with the company ground station. The flight crew can also manually change these factors via the ACFT STATUS panel of the DATA/STATUS page.

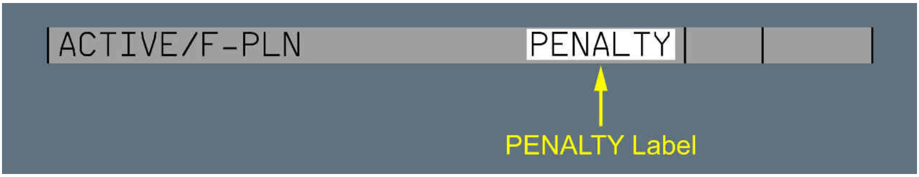
PENALTY Label



GENERAL

Ident.: DSC-22-FMS-10-60-00004485.0001001 / 14 APR 14
Applicable to: ALL

The FMS has an Engine-Out (EO) mode. The EO mode enables the FMS to take an engine failure into account for the computation of the performance data, the flight plan predictions, and the long-term guidance targets.
If an engine failure occurs, the FMS considers that the engine is out, and automatically activates the EO mode.

When the EO mode becomes active, the FMS:
- Changes the managed speed target
- Updates the flight plan predictions, based on:
  - The new managed speed target
  - The EO maximum altitudes:
    - ■ The LRC Engine-Out Maximum Flight Level (LRC EO MAX FL)
    - ■ The drift-down altitude
- Deletes all preselected speeds, if any
  The flight crew can enter new preselected speeds, if required.
- Creates a temporary flight plan with the Engine-Out Standard Instrument Departure (EOSID), if applicable
- Deletes all altitude steps (climb or descent), if any
- Deletes the time constraint, if any
- Displays the PERF page (*Refer to page*).

As soon as the engine is recovered, the FMS automatically deactivates the EO mode. As a result, the FMS automatically returns to the normal computation of the performance data, the flight plan predictions, and the long-term guidance targets.
At all times, the flight crew can manually deactivate the EO mode via the use of the CLEAR EO button on the PERF page.

Note: 1. *If the flight crew manually deactivates the EO mode, the flight crew cannot reactivate the EO mode. The EO mode will remain inactive. The FMS will reactivate the EO mode, only if the engine is recovered, and then an engine-out occurs again.*
2. *The EO mode is applicable only in the case of a real engine failure. If the flight crew needs to simulate an engine-out, they can use the WHAT IF function. For more information about the WHAT IF function, Refer to DSC-22-FMS-10-40-40 WHAT IF Function.*

ENGINE-OUT SID

Ident.: DSC-22-FMS-10-60-00004486.0001001 / 03 JUL 20
Applicable to: ALL

The Engine-Out Standard Instrument Departure (EOSID) is a standard procedure to fly, if an engine-out occurs just after takeoff.
The DEPARTURE page displays the ident of the EOSID that is stored in the navigation database. If there is no stored EOSID, the NONE label appears instead of the ident.

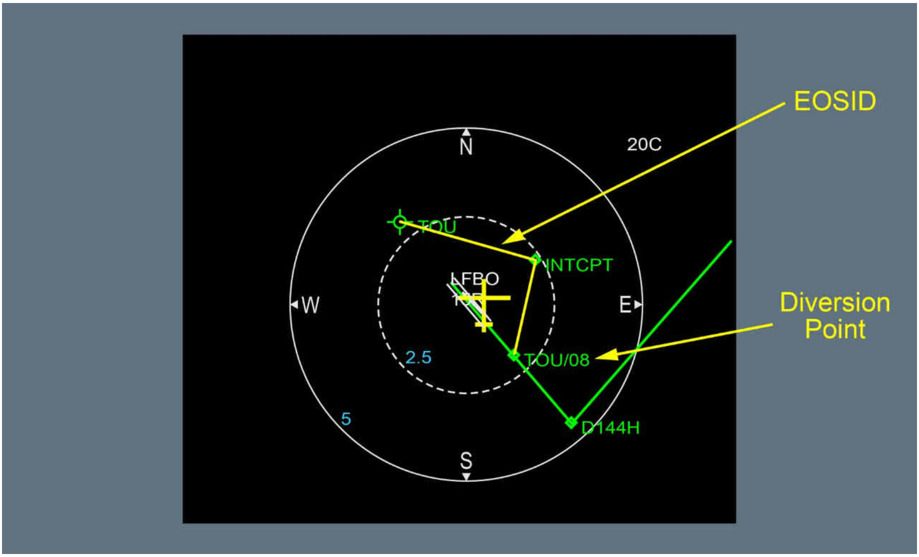
E014B	108.90	14L	3000M	144°	AMOL5H	NONE

The flight crew can check the stored EOSID via the PLAN mode of the ND. A yellow line indicates the EOSID.

The point from which the SID and the EOSID diverge is referred to as the diversion point.

EOSID in PLAN Mode on the ND



If an EOSID is stored in the navigation database, the FMS can take this EOSID into account. The FMS compares the position of the aircraft to the diversion point in order to take the EOSID into account.

1 BEFORE THE DIVERSION POINT

If an engine failure occurs before the diversion point, the FMS creates a temporary flight plan in which the FMS strings the EOSID after the diversion point. A discontinuity follows the EOSID. The flight crew can insert(erase) the temporary flight plan, if they want(do not want) to fly the EOSID.

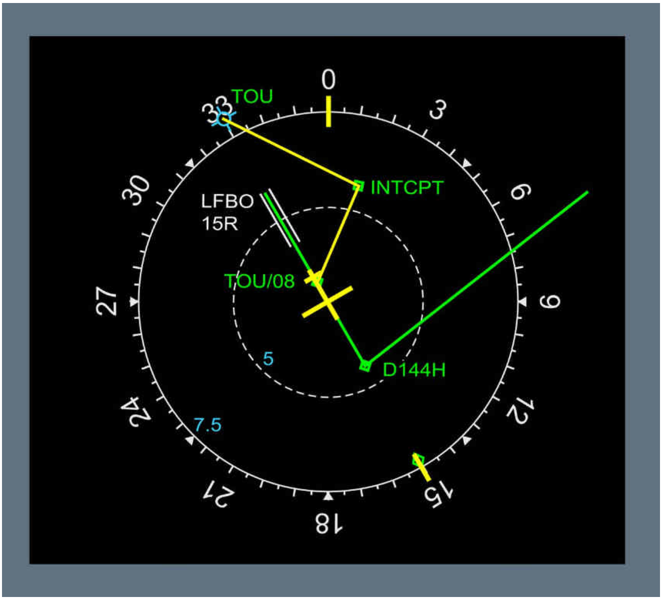
2 **AFTER THE DIVERSION POINT**

If an engine failure occurs after the diversion point, the FMS does not insert the EOSID in the flight plan. On the ND, a yellow line indicates the EOSID for information only.
To fly the EOSID, the flight crew can perform a DIR TO a waypoint of the EOSID, and then adjusts the flight plan.

After Diversion Point



LRC ENGINE-OUT MAXIMUM FLIGHT LEVEL (LRC EO MAX FL)

Ident.: DSC-22-FMS-10-60-00004488.0001001 / 09 MAR 16
Applicable to: ALL

The FMS computes the LRC Engine-Out Maximum Flight Level (LRC EO MAX FL).

At the LRC EO MAX FL, the aircraft:
- Is able to level off at the EO-LRC speed, with the running engine at MCT, the anti-ice OFF, and the failed engine in windmilling
- Has a buffet margin of 0.3 g.

The computation of the LRC EO MAX FL is based on the current gross weight of the aircraft and the delta ISA.
The PERF page displays the current LRC EO MAX FL.
L2 Since the LRC EO MAX FL is intended for use during the cruise phase, it is not relevant for the takeoff phase.

Therefore, before takeoff, the LRC EO MAX FL may display an invalid value (XXX) if:

- The TOW of the aircraf is near MTOW, and
- The atmosphere temperature is high.

After takeoff, the TOW decreases. As soon as the TOW is sufficiently low to permit the calculation of the LRC EO MAX FL, the LRC EO MAX FL is recovered and valid.

DRIFT-DOWN ALTITUDE

Ident.: DSC-22-FMS-10-60-00004489.0001001 / 14 APR 14
Applicable to: ALL

When the EO mode is active, during the CRZ flight phase, the FMS computes the drift-down altitude. The drift-down altitude is the maximum flight level at which the aircraft is able to level off at the EO-GDOT speed, with the running engine at MCT.

L2 The FMS computes the drift-down altitude as follows: When the aircraft descends at the EO-GDOT speed, the drift-down altitude is the altitude at which the aircraft will begins to level off.

L1 The CRZ panel of the PERF page displays the drift-down altitude.

ENGINE-OUT DURING THE T.O FLIGHT PHASE

Ident.: DSC-22-FMS-10-60-00004490.0001001 / 14 APR 14
Applicable to: ALL

BELOW THE THRUST REDUCTION ALTITUDE

If an engine failure occurs below the thrust reduction altitude during the T.O flight phase:

- The speed target is the current aircraft speed
  The lower limit of the speed target is V2. The upper limit of the speed target is V2 + 15 kt.
- The FMS takes the EOSID into account as follows:
  - If the aircraft is before the diversion point, the FMS creates a temporary flight plan with the EOSID, or
  - If the aircraft is after the diversion point, the ND displays the EOSID for information only

  For more information about the EOSID, *Refer to DSC-22-FMS-10-60 Engine-Out Standard Instrument Departure (EOSID)*.
- The FMS displays the PERF page (*Refer to page*).

  On the PERF page:
  - The EO MAX label is displayed in amber
  - The CLR EO button is displayed at the bottom of the page.

FLIGHT PLAN PREDICTIONS

The FMS does not compute the flight plan predictions, until the aircraft reaches the acceleration altitude.

ABOVE THE THRUST REDUCTION ALTITUDE

If an engine failure occurs above the thrust reduction altitude during the T.O flight phase:

- The speed target is the current aircraft speed
  The lower limit of the speed target is V2. The upper limit of the speed target is V2 + 15 kt.
- LVR MCT flashes on the FMA
- The ND displays the EOSID for information only
  For more information about the EOSID, *Refer to DSC-22-FMS-10-60 Engine-Out Standard Instrument Departure (EOSID)*.
- The FMS displays the PERF page (*Refer to page*).

  On the PERF page:
  - The EO MAX label is displayed in amber
  - The CLR EO button is displayed at the bottom of the page.

FLIGHT PLAN PREDICTIONS

The FMS does not compute the flight plan predictions, until the aircraft reaches the acceleration altitude.

ENGINE-OUT DURING THE CLB FLIGHT PHASE

Ident.: DSC-22-FMS-10-60-00004491.0001001 / 04 MAY 16
Applicable to: ALL

BELOW THE LRC EO MAX FL

If an engine failure occurs below the LRC EO MAX FL during the CLB flight phase:
- The FMS defines the managed speed target as follows:
  - When the aircraft climbs (in CLB or OP CLB mode), the managed speed target is the EO-GDOT speed
  - When the aircraft is in level flight (in ALT, ALT*, ALT CST, or ALT CST* mode), the managed speed target is the EO-LRC speed, limited by the speed limit or the speed constraint, if any

  Note: To prevent significant thrust reduction, the FMS gradually decreases the managed speed target from the current speed to the EO-GDOT (or EO-LRC) speed at a rate of 1 kt per second.

- LVR MCT flashes on the FMA
- The FMS displays the PERF page (*Refer to page*).

  On the PERF page:
  - The EO MAX label is displayed in amber
  - The CLR EO button is displayed at the bottom of the page
  - The speed mode table of the CLB panel displays the managed speed (the EO-GDOT or EO-LRC speed).

    Note: The flight crew can manually select the ECON speed mode instead of the LRC speed mode. In ECON speed mode, the managed EO speed is the EO-ECON speed instead of the EO-LRC speed.

FLIGHT PLAN PREDICTIONS

The FMS computes the flight plan predictions based on the following assumptions:
- The speed is the EO-GDOT (or EO-LRC) speed
- The aircraft performs the cruise at the lowest of the following two flight levels:
  - The CRZ FL
  - The LRC EO MAX FL.

ABOVE THE LRC EO MAX FL

If an engine failure occurs above the LRC EO MAX FL during the CLB flight phase:

- The CLB mode, if engaged, reverts to OP CLB (or V/S, with the current vertical speed)

  Note: The flight crew cannot arm or engage the CLB mode above the LRC EO MAX FL.

- The FMS defines the managed speed target as follows:
  - When the aircraft climbs (in OP CLB or V/S mode), the managed speed target is the EO-GDOT speed

    Note: To prevent significant thrust reduction, the FMS gradually decreases the managed speed target from the current speed to the EO-GDOT speed at a rate of 1 kt per second.

  - When the aircraft is in level flight (in ALT, ALT*, ALT CST, or ALT CST* mode), the managed speed target does not change (however, the aircraft decelerates due to engine performance)
- LVR MCT flashes on the FMA
- The FMS displays the PERF page (*Refer to page*).

  On the PERF page:
  - The EO MAX label is displayed in amber
  - The CLR EO button is displayed at the bottom of the page
  - The speed mode table of the CLB panel displays the managed speed (the EO-GDOT speed or the current managed speed target).

FLIGHT PLAN PREDICTIONS

The FMS computes the flight plan predictions based on the following assumptions:

- The aircraft immediately levels off, and decelerates to the EO-GDOT speed
- Then, the aircraft descends (at the EO-GDOT speed with a minimum vertical speed of -100 ft/min) to the LRC EO MAX FL
- The aircraft levels off at the LRC EO MAX FL and at the EO-LRC speed.

ENGINE-OUT DURING THE CRZ FLIGHT PHASE

Ident.: DSC-22-FMS-10-60-00004492.0001001 / 14 APR 14
Applicable to: ALL

If an engine failure occurs during the CRZ flight phase:

- The FMS defines the managed speed target as follows:
  - When the aircraft is above the LRC EO MAX FL, the managed speed target does not change (However, the aircraft will decelerate due to engine performance.)
    When the flight crew engages the OP DES mode, the managed speed target becomes the EO-GDOT speed.
  - When the aircraft is at or below the LRC EO MAX FL, the managed speed target depends on the FMS speed mode that the flight crew selects:
    - ■ EO-LRC speed mode: The managed speed target is the EO-LRC speed that ensures a minimum fuel consumption (long range)
    - ■ EO-ECON speed mode: The managed speed target is the EO-ECON speed that is based on the current cost index

    If the flight crew initiates a climb (and the aircraft is below the drift-down altitude), the managed speed target is the EO-GDOT speed.
- LVR MCT flashes on the FMA
- The FMS displays the PERF page (*Refer to page*).

  On the PERF page:
  - The EO MAX label is displayed in amber
  - The CLR EO button is displayed at the bottom of the page
  - The speed mode table of the CRZ panel displays:
    - ■ The managed speed (the EO-GDOT, EO-LRC, or EO-ECON speed)
    - ■ The drift-down altitude.

FLIGHT PLAN PREDICTIONS

The FMS computes the flight plan predictions based on the following assumptions:

- The aircraft decelerates to the EO-GDOT speed
- Then, the aircraft descents (at the EO-GDOT speed with a minimum vertical speed of -100 ft/min) to the LRC EO MAX FL
- The aircraft levels off at the LRC EO MAX FL and at the EO-LRC speed.

ENGINE-OUT DURING THE DES OR APPR FLIGHT PHASE

Ident.: DSC-22-FMS-10-60-00004493.0001001 / 14 APR 14
Applicable to: ALL

If an engine failure occurs during the DES or APPR flight phase:
- The managed speed target does not change
- The DES mode, if engaged, reverts to the V/S mode (with the current vertical speed)

  Note: *The flight crew can keep the V/S mode, or can engage the OP DES mode, as appropriate.*
  Below the LRC EO MAX FL, the flight crew can engage the DES mode again.

- LVR MCT flashes on the FMA
- The FMS displays the PERF page (*Refer to page*).

  On the PERF page:
  - The EO MAX label is displayed in amber
  - The CLR EO button is displayed at the bottom of the page.

FLIGHT PLAN PREDICTIONS

The FMS computes the theoretical descent and approach path, based on a one-operative engine model.

If the engine failure occurs above the LRC EO MAX FL, the FMS computes the flight plan predictions based on the following assumptions:
- The flight crew engages the OP DES mode
- The OP DES mode remains engaged, until the aircraft reaches the LRC EO MAX FL
- At the LRC EO MAX FL, the flight crew engages the DES mode.

ENGINE-OUT DURING THE GA FLIGHT PHASE

Ident.: DSC-22-FMS-10-60-00004494.0001001 / 14 APR 14
Applicable to: ALL

For an engine failure during the GA flight phase, the computations and procedures of the T.O flight phase apply.
However, the ND does not display the EOSID.

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-60-00004495.0001001 / 14 APR 14
Applicable to: ALL

ON THE MFD

The PERF page permanently displays the current LRC EO MAX FL in the upper right corner of the page.

If the EO mode is active:
- The FMS page header displays the EO label
- On the PERF page:
  - The EO MAX label is displayed in amber
  - The CLEAR EO button is displayed at the bottom of the page
  - The speed mode tables of the CLB and CRZ panels display the EO managed speeds (the EO-GDOT, EO-LRC, or EO-ECON speed), if applicable.

If the engine failure occurs after the diversion point, the ND displays the EOSID for information only (with a solid yellow line).
For more information about the display of the EOSID on the ND, *Refer to DSC-31-CDS-40-40-80 FMS Data Overview*.

ASSOCIATED MESSAGES

Ident.: DSC-22-FMS-10-60-00004496.0001001 / 14 APR 14
Applicable to: ALL

On the MFD, the FMS message area displays the following message: CHECK EO SPD SETTING (*Refer to message*).

Takeoff Monitoring Function

TAKEOFF MONITORING FUNCTION ⋪

Ident.: DSC-22-FMS-10-70-10-00023927.0001001 / 03 JAN 19
Applicable to: ALL

From 30 kt IAS to 90 kt IAS during takeoff roll, the Takeoff Monitoring (TOM) function monitors the real acceleration of the aircraft. When the aircraft reaches 90 kt, the TOM function compares the real distance covered by the aircraft with the distance corresponding to the nominal performance of the aircraft. If the TOM function detects that the aircraft performance is degraded by more than 15 %, the T.O ACCELERATION DEGRADED ECAM alert is triggered.
The TOM function alerts the flight crew of a significant reduction in performance. It does not determine the primary cause of the degradation.

The following are examples of factors that can affect the acceleration of the aircraft during takeoff roll:
- ZFW entry error
- Residual braking
- Reduced engine performance
- Extension of a flight control surface that modifies the expected drag.

Note: The triggering of the T.O ACCELERATION DEGRADED ECAM alert is independent from the takeoff thrust setting (FMS entry and thrust lever position).

Intentionally left blank

Takeoff Surveillance Function

TAKEOFF SURVEILLANCE FUNCTION

Ident.: DSC-22-FMS-10-70-20-10-00023495.0001001 / 14 JUN 16
Applicable to: ALL

The Takeoff Surveillance (TOS) function checks the takeoff data that the flight crew enters and selects on the FMS pages.
The takeoff surveillance function applies to the FMS pages that are associated with the active flight plan only.

The checks aim to ensure that the takeoff data is:
- Consistent
- Compatible with the aircraft performance data that is required for takeoff.

The FMS performs the following takeoff checks:
- The ZFW check
- The takeoff speeds check
- The liftoff distance check
- The aircraft position check.

Ident.: DSC-22-FMS-10-70-20-10-00023496.0001001 / 14 JUN 16
Applicable to: ALL

ZFW CHECK

The FMS checks that the ZFW value that the flight crew enters on the FUEL&LOAD page is within the acceptable range.
If the entered ZFW is not within the acceptable range, the FMS message area displays the ENTRY OUT OF RANGE message.

Ident.: DSC-22-FMS-10-70-20-10-00023497.0001001 / 14 JUN 16
Applicable to: ALL

TAKEOFF SPEEDS CHECK

For the takeoff speeds (V1, VR, and V2) that the flight crew enters on the T.O panel of the PERF page:

- The FMS checks that the V1, VR, and V2 entry fields contain values.

  If the flight crew does not enter one or more of the takeoff speed values, the ECAM triggers the T.O SPEEDS NOT INSERTED alert, when:
  - The flight crew presses the T.O CONFIG pb of the ECP, or
  - The engines are set to takeoff power.
- The FMS compares V1, VR, and V2.

  If the entered V1, VR, and V2 do not satisfy the condition V1 ≤ VR ≤ V2:
  - The FMS message area displays the V1/VR/V2 DISAGREE message
  - The ECAM triggers the T.O V1/VR/V2 DISAGREE alert, when:
    - The flight crew presses the T.O CONFIG pb of the ECP, or
    - The engines are set to takeoff power.
- The FMS checks that V1, VR, and V2 satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G). If the entered V1, VR, and V2 do not satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G):
  - The FMS message area displays the T.O SPEED TOO LOW CHECK TOW & T.O DATA message
  - The ECAM triggers the T.O SPEEDS TOO LOW alert, when:
    - The flight crew presses the T.O CONFIG pb of the ECP, or
    - The engines are set to takeoff power.

Ident.: DSC-22-FMS-10-70-20-10-00023498.0001001 / 14 JUN 16
Applicable to: ALL

LIFTOFF DISTANCE CHECK

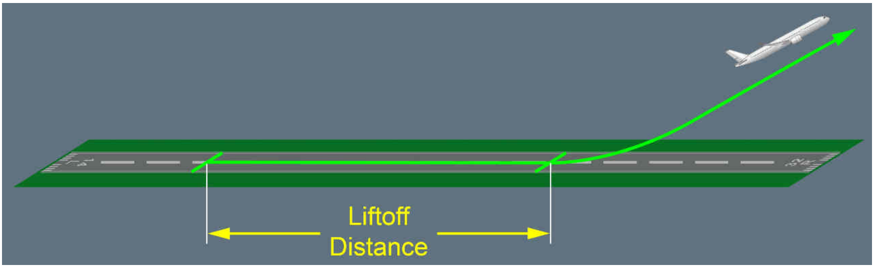
The FMS computes the runway length available for takeoff, and the liftoff distance.
The FMS compares the liftoff distance with the available runway length.

If the liftoff distance is more than the available runway length:
- The FMS message area displays the T.O RWY TOO SHORT CHECK TOW & T.O DATA message
- The ECAM triggers:
  - The T.O RWY TOO SHORT alert, when the flight crew presses the T.O CONFIG pb of the ECP
  - The T.O RWY TOO SHORT alert, when the engines are set to takeoff power.

COMPUTATION OF THE LIFTOFF DISTANCE

The liftoff distance is the distance between the position at which the flight crew releases the aircraft brakes in order to take off, and the position at which the aircraft leaves the ground.

Liftoff Distance



The FMS computes the liftoff distance based on the following data:
- The aircraft weight (the TOW or the GW)
- VR and V2
- The flaps setting
- The T.O thrust
- The anti-ice setting
- The pack setting.

Before the engines are set to takeoff power, in order to compute the liftoff distance, the FMS uses:
- The TOW
  The FMS computes the TOW with the ZFW, the block fuel, and the taxi fuel that the flight crew enters on the FUEL&LOAD page
- The VR, the V2, the flaps setting, the T.O thrust, the anti-ice setting, and the pack setting that the flight crew enters and selects on the T.O panel of the PERF page.

When the engines are set to takeoff power, in order to compute the liftoff distance, the FMS uses:

- The real aircraft weight (i.e. the GW)
  L3 The FQMS provides the GW.
- L1 The VR and the V2 that the flight crew enters on the T.O panel of the PERF page
- The flaps setting that corresponds to the real position of the FLAPS lever
  L3 The slats/flaps system provides the real position of the FLAPS lever.
- L1 The real T.O thrust, the real anti-ice setting, and the real pack setting.
  L3 The engines provide the real T.O thrust, the real anti-ice setting, and the real pack setting.

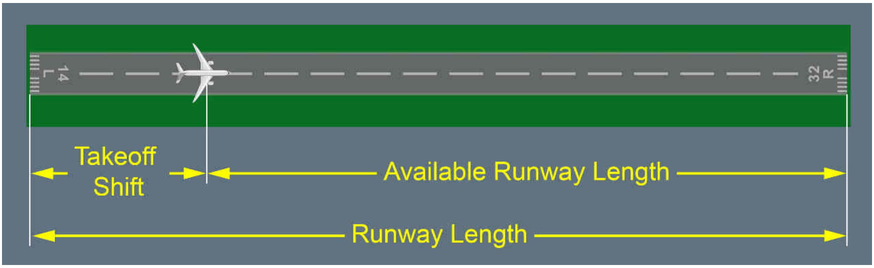
L1 **CAUTION** The FMS does not use the wind data to compute the liftoff distance.

L2 The FMS also uses the following data to compute the liftoff distance:

- The altitude
  L3 The ADIRS provides the altitude.
- L2 The OAT
  L3 The ADIRS provides the OAT.
- L2 The slope of the departure runway.
  L3 The FMS computes the slope based on the data that is stored in the navigation database.
  If the departure runway is not in the navigation database, the FMS uses a default value.

L1 COMPUTATION OF THE AVAILABLE RUNWAY LENGTH

The FMS computes the available runway length as follows: Available runway length = runway length - runway takeoff shift.
The runway takeoff shift is the distance between the runway threshold, and the position at which the flight crew releases the aircraft brakes in order to take off.



Before the engines are set to takeoff power, the FMS uses:
- The runway length of the departure runway that is in the active flight plan.
  The runway length is the runway length stored in the navigation database.
  L3 If the departure runway is a pilot-stored runway, the runway length is the runway length stored in the pilot-stored elements database.
- L1 The runway takeoff shift that the flight crew enters on the T.O panel of the PERF page.

When the engines are set to takeoff power:
- The FMS uses the runway length of the current runway.
  The Airport Navigation Function (ANF) provides the ident of the current runway, based on the current position of the aircraft.
  The runway length is the runway length stored in the navigation database.

  Note: *If the ANF does not provide the runway ident, the FMS does not perform the liftoff distance check.*
- The FMS computes the runway takeoff shift based on the current aircraft position.
  The ADIRS provides the current aircraft position.

Ident.: DSC-22-FMS-10-70-20-10-00023499.0003001 / 07 MAY 18
Applicable to: ET-AUC

AIRCRAFT POSITION CHECK

The aircraft position check aims at preventing takeoff on an unexpected runway or on a taxiway.
ANF compares the aircraft position with the different runways provided through the ANF database.

When one thrust lever is set at or above the CLB detent, the ECAM triggers:
- The NAV ON TAXIWAY alert, when the aircraft is not on a runway
- The NAV NOT ON FMS RUNWAY alert, when the aircraft is on a runway different from the one selected on DEPARTURE page.

Ident.: DSC-22-FMS-10-70-20-10-00023499.0001001 / 03 JAN 19

AIRCRAFT POSITION CHECK

The aircraft position check aims at preventing takeoff on an unexpected runway or on a taxiway.
ANF compares the aircraft position with the different runways provided through the ANF database.

When one thrust lever is set at or above the CLB detent, the ECAM triggers:
- The NAV ON TAXIWAY alert, when the aircraft is not on a runway
- The NAV NOT ON FMS RUNWAY alert, when the aircraft is on a runway different from the one selected on DEPARTURE page.

TIME FUNCTION

Ident.: DSC-22-FMS-10-80-00009742.0001001 / 14 APR 14
Applicable to: ALL

The time function of the ADIRS provides the aircraft time reference (date and UTC time).

L2 For more information about the time function of the ADIRS, *Refer to DSC-34-NAV-20-10-70 Time Function*.

L1 In addition, the time function of the FMS:
- Computes the block time and the flight time
- Enables the flight crew to define time markers
- Computes airport local times.

FLIGHT TIME AND BLOCK TIME

The FMS computes the block time and the flight time, based on the start and stop times.

Usually, the block time is the elapsed time between the start and stop times that are defined as follows:
- The start time is the time at which the aircraft leaves the gate at the departure airport
- The stop time is the time at which the aircraft reaches the gate at the destination airport.

Usually, the flight time is the elapsed time between the start and stop times that are defined as follows:
- The start time is the time at which the aircraft takes off
- The stop time is the time at which the aircraft lands.

The Operator defines the start and stop times.

L2 The Operator defines the start and stop times via the Out-Off-On-In (OOOI) function of the COMPANY COM application. For more information about the COMPANY COM application, *Refer to DSC-46-OIS-10-40 COMPANY COM*.

L1 On the POSITION/TIME page, the flight crew can manually modify the start and stop times that the FMS uses to compute the block time and the flight time.
The flight crew can display the block time or the flight time in the permanent data, via the POSITION/TIME page.

TIME MARKERS

A time marker is a time reminder.
The flight crew can define up to three time markers.

The flight crew defines the time markers via the POSITION/TIME page. To define a time marker, the flight crew:
- Enters the UTC time that defines the time marker, or
- Enters the remaining time between the current UTC time and the UTC time that defines the time marker.

The upper part of the ND displays the UTC pseudo waypoint. The UTC pseudo waypoint is the position at which the aircraft will be at the UTC time that defines the time marker.
The flight crew selects the AURAL ALERT option on the POSITION/TIME page, if they want the "Time Marker" audio indicator to sound.
The "Time Marker" audio indicator sounds, when the remaining time between the current UTC time and the UTC time that defines the time marker is equal to 30 s.

Time Marker (Sound and Synthetic Voice)
On the POSITION/TIME page, the flight crew can enter text in order to identify the time marker. This text is not mandatory for definition of the time marker, and is displayed on the POSITION/TIME page only.
When the current UTC time is equal to the UTC time that defines the time marker, the FMS message area displays the TIME MARKER REACHED message.

AIRPORT LOCAL TIMES

On the POSITION/TIME page, the flight crew can display the local time at two different airports.
One of these two airports is automatically the destination airport.
The FMS computes the local time as follows: Local time = UTC time + Time difference.
The flight crew manually enters the time difference.
Example: The UTC time is 13:00. The flight crew enters the time difference in the UTC DIFF entry fields as follows: +8 in the UTC DIFF H entry field, and 00 in the UTC DIFF MN entry field. As a result, the local time is 21:00.

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-80-00016529.0001001 / 14 APR 14

L2 For more information about the permanent data, *Refer to DSC-31-CDS-60-10-80 Permanent Data*.

ASSOCIATED MESSAGES

Ident.: DSC-22-FMS-10-80-00016530.0001001 / 14 APR 14
Applicable to: ALL

On the MFD, the FMS message area displays the following messages:
- CHECK TIME REF (*Refer to message*)
- TIME MARKER REACHED (*Refer to message*).

PRINT FUNCTION

Ident.: DSC-22-FMS-10-90-00004500.0001001 / 01 SEP 16
Applicable to: ALL

The print function of the FMS enables the flight crew to print the following data and reports:
- The flight plan data
- The flight plan reports
- The data received via datalink.

These data and reports are printed:
- Manually, at the request of the flight crew , or
- Automatically, in the case of specific events.

L2 The print function also enables the flight crew to print FMS database reports.

Note: *In the printed data:*
- *The destination flight plan is referred to as the PRIMARY F-PLN*
- *The alternate flight plan is referred to as the ALTN F-PLN.*

L1 FLIGHT PLAN DATA

The flight plan data includes:

- The initialization data of the flight plan

Initialization Data of the Flight Plan

Via the DATA/PRINTER page, the flight crew can manually print the flight plan reports for the active flight plan, or select the AUTO PRINT option to automatically print the reports. When the flight crew selects the AUTO PRINT option, the reports are automatically printed as follows:

- At engine start, the preflight report is automatically printed
- When the T.O flight phase becomes active, the in-flight report is automatically printed
- At engine shutdown, the postflight report is automatically printed.

FLIGHT PLAN REPORTS FOR THE SECONDARY FLIGHT PLANS

The flight plan reports for the secondary flight plans include:

- The preflight report

Preflight Report for a Secondary Flight Plan

L2 If the flight crew used a copy of the active flight plan to create the SEC 1(2)(3) flight plan, and if the active flight leg of the SEC 1(2)(3) flight plan is identical to the active flight leg of the active flight plan:

- A preflight report is available during the PREFLIGHT flight phase
- An in-flight report is available in flight, except during the DONE flight phase.

In all other cases, the SEC 1(2)(3) flight-plan report is a preflight report.

L1 The flight crew can manually print the flight plan reports for the secondary flight plans via the DATA/PRINTER page and the SEC INDEX page.

The flight crew can manually print the FMS database reports via the FMS P/N panel of the DATA/STATUS page.

CONTROLS AND INDICATORS

Ident.: DSC-22-FMS-10-90-00014180.0001001 / 01 SEP 16
Applicable to: ALL

On the DATA/PRINTER page, the flight crew can:

- Click on the PRINT buttons to manually print:
  - The flight plan data for the active flight plan
  - The flight plan reports for the active and secondary flight plans
- Select the AUTO PRINT option to automatically print:
  - The data received via datalink with the company ground station
  - The flight plan reports for the active flight plan.

GENERAL

Ident.: DSC-22-FMS-20-80-00005226.0001001 / 22 APR 14
Applicable to: ALL

This chapter provides the list of all of the data that the flight crew can enter on the MFD and interactive ND.

For each data, the table displays:
- The format

  Note: *The flight crew can omit leading and trailing zeros. If not, a note specifies that the flight crew must enter leading or trailing zeros.*

  The following characters are usually used to indicate the format:
  - A: Letters
  - T: True reference
  - N: Numeric (numbers)
  - X: Alphanumeric (letters and numbers).
- The units
- The range
- The resolution

  Note: *When the flight crew scrolls the data with the wheel of the KCCU, the resolution is the scroll increment/decrement.*
- The FMS page(s) on which the flight crew enters the data.

Intentionally left blank

GENERAL

Applicable to: ALL

Ident.: DSC-22-FMS-20-90-10-00005341.0001001 / 03 JUL 20

There are two types of FMS messages:
- Type I messages: These messages are a direct result of a flight crew action
- Type II messages: These messages automatically appear to inform the flight crew of a specific situation, or to request a flight crew action.

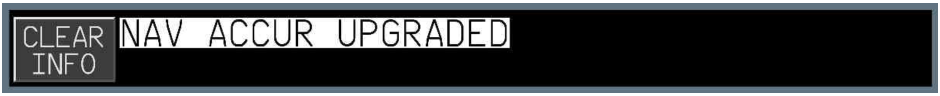
The FMS messages appear in the FMS message area on the MFD.

Note: *Some Type II messages also appear on the ND, or on the PFD.*

Type I messages always have priority over Type II messages.

1 MESSAGE COLOR

In the FMS message area, the messages appear:
- In black on a white background for messages that result from a flight crew entry, and for messages that are not of high importance

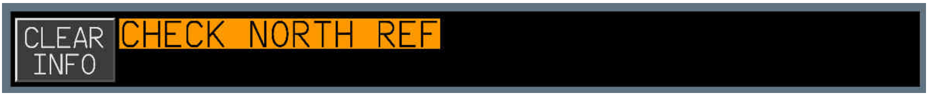


NAV ACCUR UPGRADED

Note: *On the ND and the PFD, these messages appear in white.*

NAV ACCUR UPGRADED

- In black on an amber background for messages that are related to navigation, for messages that request the flight crew to enter data, and for messages with a high level of importance.



CHECK NORTH REF

Note: *On the ND and the PFD, these messages appear in amber.*

CHECK NORTH REF

CONDITIONS REQUIRED TO AUTOMATICALLY CLEAR MESSAGES

Type I messages are automatically cleared, when one of the following occurs:

- The display conditions of the message no longer apply, because the flight crew makes a valid entry or selection
- The flight crew presses the DIR TO, F-PLN, INIT, NAVAIDS, PERF, or SEC key on the KCCU.

Type II messages are automatically cleared, when the display conditions of the message no longer apply.

MESSAGE LIST

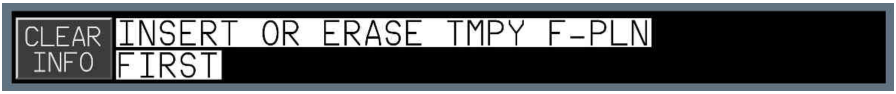
Type II messages are stored in a message list.
This message list can contain a maximum of 5 messages. When the message list is full, the message that is first removed from the list is the message that was first stored in the list.
The first message of the message list is displayed in the FMS message area (if no Type I message is currently displayed).
A message is automatically removed from the list as soon as the display conditions of the message no longer apply.
When the flight crew clears a Type II message, this message is not removed from the message list, as long as the display conditions apply. After the flight crew clears a Type II message, the FMS message area displays the next message of the message list. The next message that appears is the next message of the message list that the flight crew did not previously clear.
The message list is displayed on the MESSAGES LIST page. The flight crew can access this page via the MSG LIST button of the FMS message area. This button appears, only when no messages are displayed in the FMS message area.

Ident.: DSC-22-FMS-20-90-10-00005343.0001001 / 17 APR 14

FMS MESSAGE AREA

The FMS message area displays the messages on two lines of 33 characters.

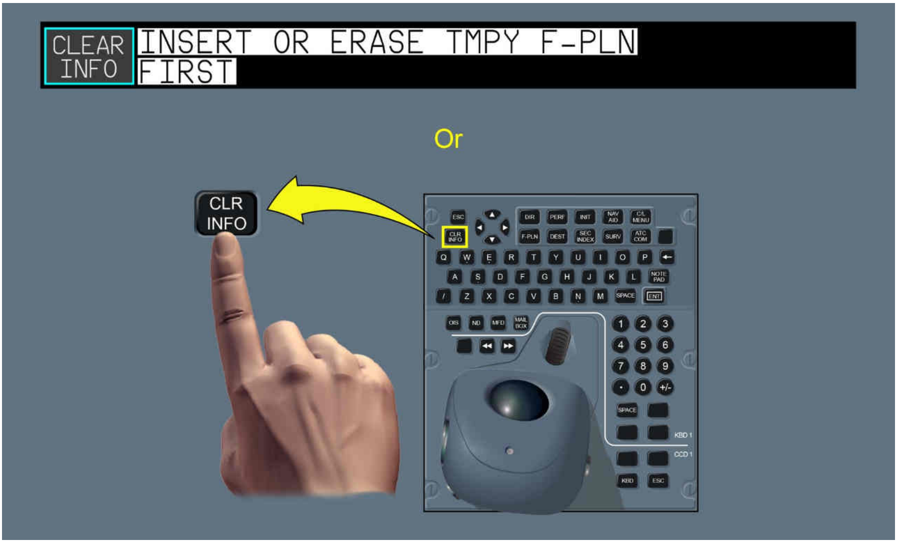
FMS Message Area



INSERT OR ERASE TMPY F-PLN
FIRST

In order to clear the displayed message, the flight crew clicks on the CLEAR INFO button, or presses the CLR INFO key on the KCCU.

Clear Info



INSERT OR ERASE TMPY F-PLN FIRST

When no messages are displayed, the flight crew can access the MESSAGES LIST page. In order to access the MESSAGES LIST page, the flight crew clicks on the MSG LIST button.

Message List

The MESSAGES LIST page displays the last 5 Type II messages.
For more information about the MESSAGES LIST page, *Refer to DSC-22-FMS-20-20-20 MESSAGES LIST Page*.

10 RWY s MAX : ALL IN USE

Ident.: DSC-22-FMS-20-90-00005490.0001001 / 14 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The pilot-stored elements database is full, and the flight crew tries to store a new runway. The 10 RWYs MAX : ALL IN USE message informs the flight crew that the new runway cannot be stored.

20 NAVAIDS MAX : ALL IN USE

Ident.: DSC-22-FMS-20-90-00005491.0001001 / 14 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The pilot-stored elements database is full, and the flight crew tries to store a new navaid. The 20 NAVAIDS MAX: ALL IN USE message informs the flight crew that the new navaid cannot be stored.

99 WPT s MAX : ALL IN USE

Ident.: DSC-22-FMS-20-90-00005202.0001001 / 14 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The pilot-stored elements database is full, and the flight crew tries to store a new waypoint. The 99 WPTs MAX : ALL IN USE message informs the flight crew that the new waypoint cannot be stored.

ACFT POSITION NOT VALID

Ident.: DSC-22-FMS-20-90-00005344.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The aircraft position is no longer valid (while the HOLD, DIRECT TO, or CLOSEST AIRPORTS page is displayed).

ADJUST DESIRED TRK OR HDG

Ident.: DSC-22-FMS-20-90-00005345.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew inserted a DIR TO - CRS IN or a DIR TO - CRS OUT. The ADJUST DESIRED TRK OR HDG message informs the flight crew that they can adjust the aircraft heading/track to enable the computation of the INTCPT, or to change the position of the INTCPT (if the INTCPT was already computed).

ADJUSTING SPD DUE TO RTA

Ident.: DSC-22-FMS-20-90-00005346.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS computes a new managed speed target in order to comply with the time constraint. The ADJUSTING SPD DUE TO RTA message is automatically cleared after 15 s.

AIRWAY / WPT DISAGREE

Ident.: DSC-22-FMS-20-90-00005347.0001001 / 14 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	One of the following occurs: - The entered end waypoint of the airway segment does not belong to the defined airway - The entered airway does not contain the end waypoint of the previous airway segment - The waypoint that is entered at the end of a DCT and at the beginning of an airway segment does not belong to the defined airway.

AIRWAYS INSERTION IN PROGRESS F-PLN REVISION NOT ALLOWED

Ident.: DSC-22-FMS-20-90-00005348.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	An AIRWAYS revision is in progress on the MFD of the Captain(First Officer), and the flight crew tries to access another revision on the MFD of the First Officer(Captain).

ALIGN IRS

Ident.: DSC-22-FMS-20-90-00005349.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	At least one IR waits for an alignment position. In normal operation, the IR automatically aligns on the GNSS position. If the IR cannot automatically align on the GNSS position, the flight crew needs to initiate the alignment via the POSITION/IRS page (*Refer to page*).

AREA RNP IS XX.XX

Ident.: DSC-22-FMS-20-90-00005350.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew entered an RNP value that is more than the default RNP value of the current flight phase, and there is no RNP value that is defined in the navigation database for the active flight leg or route.

ARPT REF / GPS POSITION DISAGREE

Ident.: DSC-22-FMS-20-90-00005351.0001001 / 14 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The IR alignment failed. The GNSS position disagrees with the alignment position that the flight crew entered on the POSITION/IRS page (*Refer to page*).

ARPT REF / LAST IRS POSITION DISAGREE

Ident.: DSC-22-FMS-20-90-00005352.0001001 / 14 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The IR alignment failed. The last stored IR position disagrees with the alignment position that the flight crew entered on the POSITION/IRS page (*Refer to page*).

ATC F-PLN INSERTED IN SEC 3

Ident.: DSC-22-FMS-20-90-00005353.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The received ATC F-PLN is correctly loaded in the third secondary flight plan (SEC 3).

ATC F-PLN INSERTED IN SEC 3 REJECTED INFO SEE SEC/INDEX

Ident.: DSC-22-FMS-20-90-00005354.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The received ATC F-PLN is partially loaded in the third secondary flight plan (SEC 3), because the ATC center sent not valid data. The flight crew can check the rejected data on the REJECTED ATC INFO page (*Refer to page*).

CABIN RATE EXCEEDED

Ident.: DSC-22-FMS-20-90-00005355.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The aircraft is in CRZ flight phase, at less than 200 NM from the destination, and the cabin rate that is associated with the theoretical descent profile is more than the maximum cabin rate. The flight can check or change the maximum cabin rate on the DES panel of the PERF page (*Refer to page*).

CHECK ALTN WIND

Ident.: DSC-22-FMS-20-90-00005356.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The company alternate-cruise flight level that was received via uplink is not the same as the default alternate-cruise flight level.

CHECK APPR SEL

Ident.: DSC-22-FMS-20-90-00005357.0001001 / 14 APR 14
Applicable to: ALL

L12

Message Type	II
Display Type	MFD and PFD
Display Conditions	The flight crew manually tuned a landing system on the POSITION/NAVAIDS page. This manually-tuned landing system does not correspond to the approach that is selected in the flight plan. The CHECK APPR SEL message is displayed, only when the aircraft is: - In cruise, and at less than 100 NM from the T/D, or - In descent, or - In approach, and the altitude is above 800 ft.

CHECK CPNY RTE

Ident.: DSC-22-FMS-20-90-00005358.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The company route ident of the flight plan that was received via uplink is not the same as the company route ident of the flight plan request.

CHECK DATABASE CYCLE

Ident.: DSC-22-FMS-20-90-00005359.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The current date disagrees with the validity period of the active navigation database. The CHECK DATABASE CYCLE message appears, when the flight crew enters a FROM/TO airport or company route.

CHECK DEST DATA

Ident.: DSC-22-FMS-20-90-00005360.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The QNH, OAT, or destination wind, that is displayed on the APPR panel of the PERF page, is completed by a company wind uplink. The flight crew should check the uplink values.

CHECK EO SPD SETTING

Ident.: DSC-22-FMS-20-90-00005361.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and PFD
Display Conditions	In CLB flight phase, or CRZ flight phase (and the guidance mode is not ALT* or ALT): The Engine-Out (EO) mode is active, and the selected speed target is not within the range (green dot speed - 10 kt, green dot speed + 10 kt).

CHECK FLT NUMBER

Ident.: DSC-22-FMS-20-90-00005363.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The company flight number that was received via uplink is not the same as the flight number of the flight plan request.

CHECK IRS / ARPT POSITION

Ident.: DSC-22-FMS-20-90-00005362.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The difference between at least one IR position (IR 1, IR 2, or IR 3) and the airport position is 5 NM or more.

CHECK MIN FUEL AT DEST

Ident.: DSC-22-FMS-20-90-00002148.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The value of the minimum fuel at destination that is entered in the MIN FUEL AT DEST entry field of the FUEL &LOAD page (*Refer to page*) is below the ALTN + FINAL value.

CHECK NORTH REF

Ident.: DSC-22-FMS-20-90-00005365.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and ND
Display Conditions	The position of the TRUE/MAG pb disagrees with the airport north reference. The airport north reference is stored in the navigation database. The CHECK NORTH REF message can appear for the departure airport (in preflight), or for the destination airport (in arrival and approach). For more information, *Refer to DSC-22-FMS-10-30-30 Flight Management*.

CHECK ONSIDE FMS P/N

Ident.: DSC-22-FMS-20-90-00005366.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The part numbers of the FMCs are not compatible. The MFD automatically displays the FMS P/N panel of the STATUS page (*Refer to page*).

CHECK QFE

Ident.: DSC-22-FMS-20-90-00005367.0001001 / 14 APR 16
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The QFE altitude and the predicted aircraft altitude differ by more than 100 ft. For this computation, the FMS uses the QNH entry of the APPR panel of the PERF page (*Refer to page*), and the destination airport elevation. The CHECK QFE message is displayed, when the flight phase is DES or APPR, and the flight crew changes the barometric reference from QNH(STD) to QFE.

CHECK SPD MODE

Ident.: DSC-22-FMS-20-90-00005368.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The selected speed/Mach control is active, and: - The flight phase changes from CLB to CRZ, or - The flight phase changes from CLB(CRZ) to DES, or - The aircraft sequences the start waypoint of a Constant Mach Segment (CMS).

CHECK T.O DATA

Ident.: DSC-22-FMS-20-90-00005369.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The takeoff data is already entered, and the flight crew: - Changes the takeoff runway, flaps setting, or takeoff shift, or - Activates a secondary flight plan (in PREFLIGHT or DONE flight phase).

CHECK TIME REF

Ident.: DSC-22-FMS-20-90-00004374.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The aircraft time reference is set to MANUAL on the POSITION/TIME page (*Refer to page*), and the GNSS time becomes valid.

CHECK ZFW

Ident.: DSC-22-FMS-20-90-00005370.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew changed a secondary flight plan to the active flight plan, and theses two flight plans have a different ZFW or ZFWCG. *Note:* *This can happen, only before engine start.* *Before engine start, and when an exchange is performed, the FQMS uses the new ZFW and ZFWCG values to initialize.* *After engine start, the active ZFW and ZFWCG values do not change after an exchange. The FQMS does not initialize again.*

COMPANY F-PLN & LOAD DATA RECEIVED WAITING FOR INSERTION

Ident.: DSC-22-FMS-20-90-00005372.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received a flight plan and performance and load data via uplink. The flight crew should insert, or clear, the uplink data via the RECEIVED CPNY F-PLN button on: - The INIT page (*Refer to page*), or - The SEC INDEX page (*Refer to page*).

COMPANY F-PLN RECEIVED WAITING FOR INSERTION

Ident.: DSC-22-FMS-20-90-00005373.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received a flight plan data via uplink. The flight crew should insert, or clear, the uplink data via the RECEIVED CPNY F-PLN button on: - The INIT page (*Refer to page*), or - The SEC INDEX page (*Refer to page*).

COMPANY LOAD DATA RECEIVED WAITING FOR INSERTION

Ident.: DSC-22-FMS-20-90-00005374.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received a performance and load data via uplink. The flight crew should insert, or clear, the uplink data via the RECEIVED CPNY LOAD button on the INIT page (*Refer to page*).

COMPANY MSG INSERTION IN PROGRESS

Ident.: DSC-22-FMS-20-90-00005375.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The insertion of the received company takeoff data is in progress.

COMPANY T.O DATA RECEIVED WAITING FOR INSERTION

Ident.: DSC-22-FMS-20-90-00005376.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received takeoff data via uplink. The flight crew should insert, or clear, the uplink data via the RECEIVED CPNY T.O DATA page (*Refer to page*).

COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN ACTIVE

Ident.: DSC-22-FMS-20-90-00005377.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received wind data via uplink for the active flight plan. The flight crew should insert, or clear, the uplink data via the RECEIVED CPNY WIND button on the ACTIVE/WIND page (*Refer to page*).

COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN SEC 1(2)(3)

Ident.: DSC-22-FMS-20-90-00005378.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received wind data via uplink for the first(second)(third) secondary flight plan (SEC 1(2)(3)). The flight crew should insert, or clear, the uplink data via the RECEIVED CPNY WIND button on the SEC1(2)(3)/WIND page (*Refer to page*).

COMPANY WIND UPLINK PENDING

Ident.: DSC-22-FMS-20-90-00005379.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received company wind data via uplink, while there is a temporary flight plan, or while the DIRECT TO page is displayed. The flight crew must insert(clear) the temporary flight plan, or must complete the DIR TO revision, before they can insert(clear) the uplink data.

CONSTRAINTS ABOVE CRZ FL : DELETED

Ident.: DSC-22-FMS-20-90-00005380.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The CRZ FL or step altitudes changed. As a result, the following constraints are deleted: The climb and descent constraints that are at or above the new CRZ FL, and the descent constraints that are at or above any inserted step altitude.

CONSTRAINTS BEFORE XXXXXXX : DELETED

Ident.: DSC-22-FMS-20-90-00005381.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	One of the following occurs: - The flight phase changes from CRZ(DES)(APPR) to GA As a result, all altitude and speed constraints between the aircraft and the destination airport are deleted. The "XXXXXXX" corresponds to the ident of the waypoint that is after the last down-path waypoint with a descent altitude or speed constraint. - The alternate flight plan is activated. As a result, all altitude and speed constraints between the aircraft and the previous destination airport are deleted, and all altitude and speed constraints on the alternate flight plan that are below the current aircraft altitude are deleted. The "XXXXXXX" corresponds to the ident of the waypoint that is after the last down-path waypoint with a speed constraint, below the current aircraft altitude.

CRZ FL ABOVE MAX FL

Ident.: DSC-22-FMS-20-90-00005383.0001001 / 14 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew entered a flight level that is above the recommended maximum flight level. For information about the recommended maximum flight level, *Refer to DSC-22-FMS-10-50-50 Recommended Maximum Flight Level (REC MAX FL)*.

DEST / ALTN CPNY RTE DISAGREE

Ident.: DSC-22-FMS-20-90-00005385.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew tried to enter an company alternate route, and the departure airport of the company alternate route disagrees with the destination airport of the flight plan.

DEST EFOB BELOW MIN

Ident.: DSC-22-FMS-20-90-00005386.0001001 / 17 APR 14
Applicable to: ALL

L12

Message Type	II
Display Type	MFD
Display Conditions	The EFOB at the destination airport of the active flight plan is below the specified minimum fuel at destination. This message is displayed, only if one of the following applies: - The active flight phase is CRZ - The active flight phase is CLB, and the ALT mode is engaged for more than 10 min - The active flight phase is DES - The active flight phase is APPR, and the aircraft is above 800 ft AGL - The active flight phase is GA, and the aircraft is above 800 ft AGL.

DRAFT WIND INSERTED

Ident.: DSC-22-FMS-20-90-00005387.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	Temporary winds are on standby, and the FMS creates a temporary flight plan. As a result, the temporary winds are automatically inserted in the active and temporary flight plans.

ENTER DEST DATA

Ident.: DSC-22-FMS-20-90-00005388.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	All of the following occur: - The flight crew did not enter one or more of the destination data (QNH, OAT, or wind) - The flight phase is: • CRZ, and the aircraft is at less than 180 NM from the destination, or • DES, or • APPR.

ENTRY ABOVE EO MAX FL

Ident.: DSC-22-FMS-20-90-00004068.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	On the WHAT IF page, an engine-out is simulated, and the flight crew enters a cruise FL that is above the engine-out maximum FL.

ENTRY NOT IN LIST

Ident.: DSC-22-FMS-20-90-00005389.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew tried to manually enter data, and the data is not in the list that is associated with the entry field.

ENTRY OUT OF RANGE

Ident.: DSC-22-FMS-20-90-00005391.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew entered a value that is not within the acceptable range of the data, or the entered value results in the computation of a parameter that is not within the acceptable range. When applicable, the expected range and units are displayed on the second line of the FMS message area in the following format: “RNG: *(lower range limit)* TO *(upper range limit) (unit)*”. Example: RNG: 23.0 TO 28.0 %

EXPECT TURN AREA EXCEEDANCE

Ident.: DSC-22-FMS-20-90-00005392.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The aircraft will fly (or is flying) a procedure turn, and the FMS predicts that the aircraft will exceed the excursion distance (based on the predicted CAS, converted to a ground speed). The excursion distance is part of the navigation database, associated with the procedure turn.

EXTEND SPD BRK

Ident.: DSC-22-FMS-20-90-00005393.0001001 / 09 MAR 16
Applicable to: ALL

Message Type	II
Display Type	MFD and PFD
Display Conditions	Appears, if all of the following apply: - The DES or APP-DES mode is engaged - The flaps setting is neither 3 nor FULL - The aircraft needs to decelerate in order to: • Recover the FMS vertical path, or • Comply with an altitude constraint, a speed constraint, or a speed limit, or • Prevent the aircraft from being above the FMS vertical path or in an overspeed situation at a speed-monitored pseudo waypoint.

F-G/S BASED ON ISA

Ident.: DSC-22-FMS-20-90-00005394.0001001 / 17 APR 14
Applicable to: ALL

L12

Message Type	II
Display Type	MFD
Display Conditions	The computation of the F-G/S deviation is based on the ISA temperature at destination. The flight crew did not enter the temperature at destination (OAT) on the APPR panel of the PERF page (*Refer to page*). The F-G/S BASED ON ISA message is displayed, after the flight crew presses the LS pb on the EFIS CP, and when the DES or APPR flight phase becomes active.

FLT NUMBER RECEIVED

Ident.: DSC-22-FMS-20-90-00005395.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS received the flight number, as part of the flight-plan data uplink, without previous request from the flight crew.

FMC s ACFT STATUS DISAGREE

Ident.: DSC-22-FMS-20-90-00005396.0001001 / 01 SEP 16
Applicable to: ALL

L13

Message Type	II
Display Type	MFD
Display Conditions	At power-up, the critical aircraft status data is not identical between one active FMC and the backup FMC. The critical aircraft status data is: - Navigation database - Performance database - Magnetic variation database - AMI file - FM operational program - Aircraft , engine type, and engine manufacturer program pins.

FMCs ACFT STATUS DISAGREE INDEPENDENT OPERATION

Ident.: DSC-22-FMS-20-90-00005397.0001001 / 01 SEP 16
Applicable to: ALL

L13

Message Type	II
Display Type	MFD
Display Conditions	At power-up, the critical aircraft status data is not identical for the two active FMCs. FMS 1 and FMS 2 independently operate. The critical aircraft status data is: - Navigation database - Performance database - Magnetic variation database - AMI file - FM operational program - Aircraft , engine type, and engine manufacturer program pins.

FMC s PIN PROG TYPE DISAGREE

Ident.: DSC-22-FMS-20-90-00005398.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	At power-up, critical program pins (not aircraft-related or engine-type-related) are not identical between one active FMC and the backup FMC.

FMCs PIN PROG TYPE DISAGREE INDEPENDENT OPERATION

Ident.: DSC-22-FMS-20-90-00005399.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	At power-up, critical program pins (not aircraft-related or engine-type-related) are not identical for the two active FMCs. FMS 1 and FMS 2 independently operate.

FMS DATALINK NOT AVAIL

Ident.: DSC-22-FMS-20-90-00005400.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The data communication between the FMS and the Avionics Communication Router (ACR) is not available.

FMS1 / FMS2 GW DISAGREE

Ident.: DSC-22-FMS-20-90-00005401.0001001 / 09 MAR 16
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS 1 and FMS 2 gross weights differ by 2 t (4.4 klb) or more. The FMS1 / FMS2 GW DISAGREE message is automatically cleared, when the difference between the two gross weights becomes less than 1.5 t (3.3 klb).

FMS1 / FMS2 SPD TARGET DISAGREE

Ident.: DSC-22-FMS-20-90-00005806.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS 1 and FMS 2 target speeds differ by 5 kt or more. The FMS1 / FMS2 SPD TARGET DISAGREE message is automatically cleared, when the difference between the two target speeds becomes less than 2.5 kt.

FORMAT ERROR

Ident.: DSC-22-FMS-20-90-00005403.0001001 / 08 JUL 19
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The format of the value that the flight crew entered is not correct. When applicable, the expected format and units are displayed on the second line of the FMS message area in the following format: “FORMAT: *(format) (unit)*”. The following characters are used to indicate the format: - A: Letters - X: Alphanumeric (letters and numbers) - HHMMSS: Hours, minutes, and seconds - N/S: North/South - E/W: East/West - F/B: Frontbeam/Backbeam - L/R: Left/Right - UP/DN: Up/Down. Example: FORMAT: NN.N %

FORMAT ERROR ENTER ALT BEFORE PLACE/DIST

Ident.: DSC-22-FMS-20-90-00005404.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew needs to enter the step altitude first, before they can enter a place/distance start waypoint.

F-PLN ELEMENT RETAINED

Ident.: DSC-22-FMS-20-90-00005405.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The pilot-stored elements are deleted, except the elements that are still used by the FMS. The F-PLN ELEMENT RETAINED message informs the flight crew that the elements that are still used by the FMS are not deleted.

F-PLN FULL

Ident.: DSC-22-FMS-20-90-00005406.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight plan data memory is exceeded.

GLIDE DESELECTED

Ident.: DSC-22-FMS-20-90-00005410.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	All of the following occur: - The flight crew manually deselected the glide slope data on the POSITION/NAVAIDS page (*Refer to DSC-22-FMS-20-20-20 POSITION/NAVAIDS Page*) - The LOC mode is armed, or the LOC*, LOC, or LAND mode is engaged.

GPS DESELECTED

Ident.: DSC-22-FMS-20-90-00005407.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew manually deselected the GPS, and: - The aircraft is at 80 NM from the T/D, or - The APPR flight phase becomes active.

INDEPENDENT OPERATION

Ident.: DSC-22-FMS-20-90-00005411.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	A communication failure occurred between the two active FMCs: FMS 1 and FMS 2 independently operate.

INITIALIZE ZFW / ZFWCG

Ident.: DSC-22-FMS-20-90-00005412.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew started at least on engine, and the ZFW and ZFWCG are still not defined.

INSERT OR ERASE TMPY F-PLN FIRST

Ident.: DSC-22-FMS-20-90-00005413.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	A temporary flight plan that is not created by a DIR TO is on standby, and the flight crew tries to access the DIR TO revision via the KCCU.

LATERAL DISCONTINUITY AHEAD

Ident.: DSC-22-FMS-20-90-00005414.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The aircraft is at 30 s or less from flying a flight plan discontinuity.

LRC MODE IN USE

Ident.: DSC-22-FMS-20-90-00005382.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The FMS automatically set the FMS speed mode to LRC. The flight crew can manually change the FMS speed mode.

MACH SEGMENT DELETED

Ident.: DSC-22-FMS-20-90-00005415.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The Constant Mach Segment (CMS) is automatically deleted in the active flight plan, due to a flight phase transition from CRZ to another flight phase.

NAV ACCUR DOWNGRADED

Ident.: DSC-22-FMS-20-90-00005416.0001001 / 20 OCT 14
Applicable to: ALL

Message Type	II
Display Type	MFD and ND
Display Conditions	The navigation accuracy changed from HIGH to LOW. For more information, *Refer to DSC-34-NAV-20-10-60 Position Accuracy and Navigation Accuracy*.

NAV ACCUR UPGRADED

Ident.: DSC-22-FMS-20-90-00005417.0001001 / 20 OCT 14
Applicable to: ALL

Message Type	II
Display Type	MFD and ND
Display Conditions	The navigation accuracy changed from LOW to HIGH. For more information, *Refer to DSC-34-NAV-20-10-60 Position Accuracy and Navigation Accuracy*.

NAV PRIMARY

Ident.: DSC-22-FMS-20-90-00005408.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and ND
Display Conditions	For the computation of the aircraft position, at least one of the following conditions was no longer achieved, and both conditions are now achieved again: - The navigation mode is IRS/GNSS - The navigation accuracy is HIGH. For more information, *Refer to DSC-34-NAV-20-10-60 Position Accuracy and Navigation Accuracy*.

NAV PRIMARY LOST

Ident.: DSC-22-FMS-20-90-00005409.0001001 / 03 JUL 14
Applicable to: ALL

Message Type	II
Display Type	MFD and ND
Display Conditions	For the computation of the aircraft position, at least one of the following conditions is no longer achieved: - The navigation mode is IRS/GNSS - The navigation accuracy is HIGH. For more information, *Refer to DSC-34-NAV-20-10-60 Position Computation*.

NEW ACCEL ALT : HHHHH

Ident.: DSC-22-FMS-20-90-00005418.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew entered on a climb waypoint an AT or AT OR BELOW altitude constraint. As a result, the FMS considers that the aircraft levels off below the acceleration altitude. The constraint altitude becomes the new acceleration altitude. The "HHHHH" corresponds to the altitude of the altitude constraint.

NEW CRZ ALT : HHHHH

Ident.: DSC-22-FMS-20-90-00005419.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The cruise flight level (on the INIT page (*Refer to page*) and PERF page (*Refer to page*) was automatically updated with the AFS CP selected altitude. The "HHHHH" corresponds to the new cruise flight level.

NEW THR RED ALT : HHHHH

Ident.: DSC-22-FMS-20-90-00005420.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew entered on a climb waypoint an AT or AT OR BELOW altitude constraint. As a result, the FMS considers that the aircraft levels off below the thrust reduction altitude. The constraint altitude becomes the new thrust reduction altitude. The "HHHHH" corresponds to the altitude of the altitude constraint.

NO COMPANY REPLY

Ident.: DSC-22-FMS-20-90-00005421.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS did not receive any response from the company ground station within 4 min after the company request.

NO FLS FOR THIS APPR

Ident.: DSC-22-FMS-20-90-00005422.0001001 / 17 APR 14
Applicable to: ALL

L12

Message Type	II
Display Type	MFD
Display Conditions	The FMS does not compute the FLS beam for the approach that the flight crew selected. The FLS function is not available. The FMS does not compute the FLS beam: - For IGS without G/S, SDF, and LDA approaches, or - If all of the following occur: • The MAP is before the runway threshold • The angle between the course of the final-approach flight leg and the runway course is more than 50 °.

NO INTERSECTION FOUND

Ident.: DSC-22-FMS-20-90-00005423.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The FMS can neither find a shared waypoint nor an intersection (for the definition of an airway segment, LAT/LONG crossing waypoint, or place-bearing/place-bearing waypoint).

NO NAV INTERCEPTION

Ident.: DSC-22-FMS-20-90-00005424.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and PFD
Display Conditions	The HDG(TRACK) mode is engaged, and the NAV mode is armed. The NAV mode cannot engage, because all of the following occur: - The aircraft is not on the trajectory of the FMS flight plan - The current aircraft trajectory does not intersect the FMS flight plan before the TO waypoint. The ND displays no intersection path.

NO SLS FOR THIS APPR FOR FLS: DESELECT SLS ON NAVAIDS

Ident.: DSC-22-FMS-20-90-00013760.0001001 / 14 APR 16
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The SLS function is not available for the approach that the flight crew selected. To fly the approach with the FLS function, the flight crew must deselect the SLS function via the POSITION/NAVAIDS page (*Refer to page*).

NO VERT PATH INTERCEPT

Ident.: DSC-22-FMS-20-90-00004384.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and PFD
Display Conditions	The APP-DES mode is armed. The APP-DES mode cannot engage, because all of the following occur: - The aircraft is not on the FMS vertical profile - The current aircraft trajectory does not intersect the FMS vertical profile.

NOT ALLOWED

Ident.: DSC-22-FMS-20-90-00005425.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The data entry or the data selection is not permitted.

NOT ALLOWED DATABASE ARPT s ONLY

Ident.: DSC-22-FMS-20-90-00005426.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	On the DATABASE RTEs panel of the DATA/ROUTE page (*Refer to page*), the flight crew entered an airport that is a pilot-created airport.

NOT ALLOWED IN TURN

Ident.: DSC-22-FMS-20-90-00003625.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	While the aircraft performs a turn, data entry or data selection is not permitted.

NOT IN DATABASE

Ident.: DSC-22-FMS-20-90-00005427.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew entered the ident of an element (e.g. route, airport) that is neither in the navigation database nor in the pilot-stored elements database.

NOT TRANSMITTED TO ACR

Ident.: DSC-22-FMS-20-90-00005428.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew tried to send a company request or report, and a communication failure occurred between the FMS and the Avionics Communication Router (ACR).

PILOT RTE s LIST FULL

Ident.: DSC-22-FMS-20-90-00005442.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The pilot-stored route database is full. The PILOT RTEs LIST FULL message informs the flight crew that the new route creation is rejected.

PLACE / DIST IN TRANS

Ident.: DSC-22-FMS-20-90-00005444.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew tried to define a place/distance waypoint within a planned fixed-turn-radius transition between two flight legs.

PLACE / WPT DISAGREE

Ident.: DSC-22-FMS-20-90-00005445.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	To define a place/distance waypoint, the flight crew entered a PLACE that is different from the revised waypoint.

PLEASE WAIT

Ident.: DSC-22-FMS-20-90-00005446.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The FMS is processing.

PLEASE WAIT FOR COMPANY F-PLN UPLINK

Ident.: DSC-22-FMS-20-90-00005447.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew made a change on the INIT, PERF, or FUEL&LOAD page, or made a flight plan revision, while a flight plan request is in progress. The flight crew should make the flight plan changes after the flight-plan uplink data is received and inserted, to prevent data to be overwritten.

PLEASE WAIT FOR FMS RESYNCH

Ident.: DSC-22-FMS-20-90-00005448.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	An FMC resynchronization is in progress.

PRINTER NOT AVAIL

Ident.: DSC-22-FMS-20-90-00005449.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	A printer communication error occurred, while printing a report.

PROC RNP IS XX.XX

Ident.: DSC-22-FMS-20-90-00005450.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew entered an RNP value that is more than the RNP value that is defined in the navigation database for the active flight leg or route.

RECEIVED ATC MSG NOT VALID

Ident.: DSC-22-FMS-20-90-00005451.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS totally rejected the received ATC F-PLN, because the ATC center sent not valid data. The flight crew can check the rejected data on the REJECTED ATCINFO page (*Refer to page*).

RECEIVED COMPANY F-PLN NOT VALID

Ident.: DSC-22-FMS-20-90-00005452.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight plan that was received from the company ground station via uplink is not valid.

RECEIVED COMPANY LOAD DATA NOT VALID

Ident.: DSC-22-FMS-20-90-00005453.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The performance data that was received from the company ground station via uplink is not valid.

RECEIVED COMPANY T.O DATA NOT VALID

Ident.: DSC-22-FMS-20-90-00005455.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The takeoff data that was received from the company ground station via uplink is not valid.

RECEIVED COMPANY WIND DATA NOT VALID

Ident.: DSC-22-FMS-20-90-00005454.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The wind data that was received from the company ground station via uplink is not valid.

RECEIVED FLT NUMBER NOT VALID

Ident.: DSC-22-FMS-20-90-00005456.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The received flight number that is part of the flight-plan uplink data is not valid.

REENTER ZFW / ZFWCG

Ident.: DSC-22-FMS-20-90-00005461.0001001 / 09 MAR 16
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The ZFW/ZFWCG that were entered by the flight crew and the ZFW/ZFWCG that were received from the FQMS. differ by more than 0.1 t (0.2 klb) or 0.1 %. The flight crew needs to enter again the ZFW and ZFWCG values. *Note:* *The FMS also displays the REENTER ZFW / ZFWCG message, if the FUEL FQMS 1+2 FAULT alert (Refer to procedure) is triggered. In this case, the flight crew should disregard the REENTER ZFW / ZFWCG message.*

RETRACT SPD BRK

Ident.: DSC-22-FMS-20-90-00005462.0001001 / 09 MAR 16
Applicable to: ALL

Message Type	II
Display Type	MFD and PFD
Display Conditions	The DES or APP-DES mode is engaged, the speed brakes are extended, and: - The DES or APP-DES mode disengages, or - The aircraft is below the FMS vertical path and needs to recover it, or - The speed brakes are no longer necessary: • To comply with a speed limit or a speed constraint, or • To prevent the aircraft from being in an overspeed situation at a speed-monitored pseudo waypoint.

RNP PROC ERROR: FPLN/NDB MISMATCH RE-ENTER RNP PROC(S)

Ident.: DSC-22-FMS-20-90-00005371.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The RNP AR procedure that is in the active or temporary flight plan disagrees with the corresponding RNP AR procedure that is stored in the navigation database. To fly the RNP AR procedure, the flight crew must reinsert the RNP AR procedure in the flight plan. This message is not displayed, if one of the following applies: - The aircraft currently flies an RNP AR procedure - The active flight phase is T.O, and the aircraft is below 800 ft AGL - The active flight phase is APPR, and the aircraft is below 800 ft AGL - The active flight phase is GA, and the aircraft is below 800 ft AGL.

RTA ALREADY EXISTING

Ident.: DSC-22-FMS-20-90-00005463.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	In preflight, the flight crew tries to delete the FMS-computed ETT, while there is a RTA.

RTA DELETED

Ident.: DSC-22-FMS-20-90-00003640.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The RTA is automatically deleted in the active flight plan, because one of the following occurs: - The Engine-Out (EO) mode becomes active - The UTC time is no longer valid - The aircraft is in a holding pattern with manual termination, or in the deceleration zone of a holding pattern with manual termination - The flight phase changes from DES or APPR to CLB or CRZ - The flight phase becomes GA.

RTA NOT CONSIDERED FOR FUEL PLANNING

Ident.: DSC-22-FMS-20-90-00005465.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew initiates the fuel planning computation on the FUEL&LOAD page (*Refer to page*), and there is an RTA in the flight plan.

RTE IDENT ALREADY USED

Ident.: DSC-22-FMS-20-90-00005466.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The RTE IDENT ALREADY USED message informs the flight crew that the new route ident is already in the navigation database or in the pilot-stored elements database.

RUNWAY / LS DISAGREE

Ident.: DSC-22-FMS-20-90-00005467.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The flight crew manually tuned a landing system on the POSITION/NAVAIDS page (*Refer to page*), and this landing system disagrees with the selected runway in the flight plan.

SELECT HDG OR TRK FIRST

Ident.: DSC-22-FMS-20-90-00005468.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The NAV mode is engaged, the flight crew tries to insert(activate) a temporary(secondary) flight plan, and the first flight leg of the temporary(secondary) flight plan is different from the active flight leg of the active flight plan.

SELECT TRUE NORTH REF

Ident.: DSC-22-FMS-20-90-00005469.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and ND
Display Conditions	At least one IR reached an extreme latitude (> 82 ° N), and the TRUE/MAG pb is still in the MAG position.

SET HOLD SPD

Ident.: DSC-22-FMS-20-90-00005470.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and PFD
Display Conditions	All of the following occur: - The selected speed/Mach control is engaged - The aircraft is between the deceleration point and the holding entry fix - The selected speed and the holding speed differ by more than 5 kt.

SLS MANUAL TUNING NOT ALLOWED

Ident.: DSC-22-FMS-20-90-00013761.0001001 / 14 APR 16
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew tried to manually enter a channel that corresponds to an RNAV (GNSS) approach with LPV minima. Manual tuning for an RNAV (GNSS) approach with LPV minima is not permitted.

SLS NOT AVAIL: SBAS DESELECTED FOR FLS: DESELECT SLS ON NAVAIDS

Ident.: DSC-22-FMS-20-90-00013763.0001001 / 14 APR 16
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The SLS function is not available for the approach that the flight crew selected, because the SBAS is deselected. To fly the approach with the SLS function, the flight crew must reselect the SBAS via the POSITION/GNSS page (*Refer to page*). To fly the approach with the FLS function, the flight crew must deselect the SLS function via the POSITION/NAVAIDS page (*Refer to page*).

SOME REVISIONS NOT STORED

Ident.: DSC-22-FMS-20-90-00005471.0001001 / 17 APR 14
Applicable to: ALL

L12

Message Type	II
Display Type	MFD
Display Conditions	The flight crew stored a route, and some flight plan elements are removed from the stored flight plan. When a route is stored, the following flight plan elements are removed: - Holding patterns that were entered by the flight crew - Offsets - Changes to terminal area procedures - Constraints that were entered by the flight crew - Waypoints that were created by the FMS (e.g. latitude/longitude crossing waypoints) - Optimum step - CMS that was defined by the flight crew. When a route is stored, only the first 30 flight plan elements are stored. All other elements are removed.

SPD ERROR AT XXXXXXX

Ident.: DSC-22-FMS-20-90-00005473.0002001 / 14 APR 16
Applicable to: ALL

L12

Message Type	II
Display Type	MFD
Display Conditions	The speed constraint will be missed at waypoint XXXXXXX: - For waypoints: if the speed error is more than 10 kt - For pseudo-waypoints: if the speed error is more than 20 kt. Only with CDA ✻ option. *Note:* *The FMS does not simultaneously trigger the SPD ERROR AT DECEL and SPD ERROR AT XXXXXXX messages. If the conditions of display are achieved for two or more of these messages, the FMS message area displays only the message that is related to the nearest waypoint or pseudo waypoint.*

SPD LIMIT EXCEEDED

Ident.: DSC-22-FMS-20-90-00005474.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The speed limit is exceeded: The aircraft altitude is below the speed limit altitude, and the aircraft speed is more than 10 kt above the speed limit.

SPECIF NDB NOT AVAIL ◁

Ident.: DSC-22-FMS-20-90-00005475.0001001 / 14 APR 16
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The NDB (defined for an NDB approach) is deselected or not available.

SPECIF VOR-D NOT AVAIL

Ident.: DSC-22-FMS-20-90-00005476.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and ND
Display Conditions	The VOR or VOR/DME (defined for an RNAV or VOR approach) is deselected or not available.

STEP ABOVE MAX FL

Ident.: DSC-22-FMS-20-90-00005477.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The entered step altitude is above the recommended maximum flight level. For information about the recommended maximum flight level, *Refer to DSC-22-FMS-10-50-50 Recommended Maximum Flight Level (REC MAX FL)*.

STEP AHEAD

Ident.: DSC-22-FMS-20-90-00005478.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The aircraft is at less than 20 NM from the start waypoint of a step climb or step descent.

STEP DELETED

Ident.: DSC-22-FMS-20-90-00005479.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The step is automatically deleted in the active or temporary flight plan. For the active flight plan, the STEP DELETED message appears, when one of the following occurs: - The step start waypoint is sequenced, and the flight crew did not initiate the step climb or step descent - The Engine-Out (EO) mode becomes active - After a cruise altitude change in PREFLIGHT, T.O, or CLB flight phase, a step climb becomes a step descent, or vice versa - The AFS CP altitude is increased to 100 ft or more above the aircraft altitude In CRZ flight phase, all step descents and all step climbs with a step altitude below the new AFS CP altitude are deleted. - The AFS CP altitude is decreased to 100 ft or more below the aircraft altitude In CRZ flight phase, all step climbs and all step descents with a step altitude above the new AFS CP altitude are deleted. For the temporary flight plan, the STEP DELETED message appears, when the step start waypoint is deleted.

T.O RWY TOO SHORT CHECK TOW & T.O DATA

Ident.: DSC-22-FMS-20-90-00005384.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The liftoff distance check of the takeoff surveillance function is not successful. The flight crew should compute again the takeoff data, and correct the corresponding FMS entries.

T.O SPEED TOO LOW CHECK TOW & T.O DATA

Ident.: DSC-22-FMS-20-90-00005390.0001001 / 13 JAN 15
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The entered takeoff speeds (V1, VR, and V2) do not satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G).

T.O TIME REACHED

Ident.: DSC-22-FMS-20-90-00005486.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The current UTC time is equal to the ETT.

T/D REACHED

Ident.: DSC-22-FMS-20-90-00005481.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD and PFD
Display Conditions	The managed speed/Mach control is engaged, and the aircraft reaches the top of descent (T/D).

TIME ERROR AT XXXXXXX

Ident.: DSC-22-FMS-20-90-00005482.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The time constraint will be missed at waypoint XXXXXXX. The time error is more than 30 s.

TIME MARKER REACHED

Ident.: DSC-22-FMS-20-90-00005483.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The current UTC time is equal to the UTC time that defines the time marker.

TIME TO EXIT

Ident.: DSC-22-FMS-20-90-00005484.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The aircraft must immediately leave the holding pattern in order to comply with the fuel reserve requirements. The fuel reserve requirements consider that the extra fuel is equal to 0 at landing at the destination airport.

TOO STEEP PATH AHEAD

Ident.: DSC-22-FMS-20-90-00005485.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS detected a too steep path in the vertical descent profile. *Note:* *The TOO STEEP PATH AHEAD message is displayed only one time per destination.*

TRUE NORTH REFERENCED ENTRY EXPECTED

Ident.: DSC-22-FMS-20-90-00005487.0001001 / 17 APR 14
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew tried to enter a course with magnetic reference, while the aircraft flies at extreme latitudes.

TUNE BBB FFF.FF

Ident.: DSC-22-FMS-20-90-00005488.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	The FMS cannot tune the desired navaid due to a manual navaid selection. The "BBB" corresponds to the navaid ident. The "FFF.FF" corresponds to the associated frequency.

V1/VR/V2 DISAGREE

Ident.: DSC-22-FMS-20-90-00005429.0001001 / 17 APR 14
Applicable to: ALL

Message Type	II
Display Type	MFD
Display Conditions	V1, VR, and V2 do not satisfy the condition V1 ≤ VR ≤ V2.

XXXX IS DESELECTED

Ident.: DSC-22-FMS-20-90-00005489.0001001 / 07 MAY 18
Applicable to: ALL

Message Type	I
Display Type	MFD
Display Conditions	The flight crew tried to manually tune a deselected navaid, or tried to deselect a navaid that was already deselected. The "XXXX" corresponds to the ident of the navaid.

FMS SELECTOR

Applicable to: ALL

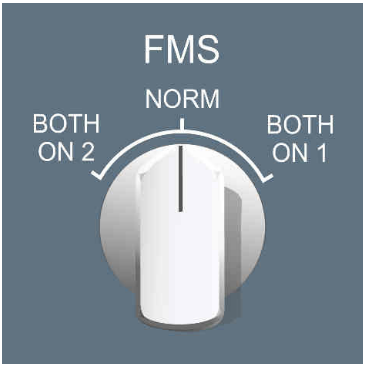
Ident.: DSC-22-FMS-20-70-10-00005103.0001001 / 22 APR 14

In the case of an FMS failure, the flight crew uses the FMS selector in order to display:
- FMS 1 data on both sides of the cockpit, or
- FMS 2 data on both sides of the cockpit.

L2 For more information about FMS abnormal operation, *Refer to DSC-22-FMS-40 Abnormal Operation*.

L1 *Note:* *The use of the FMS selector has no influence on the display of the weather and terrain data.*

FMS Selector

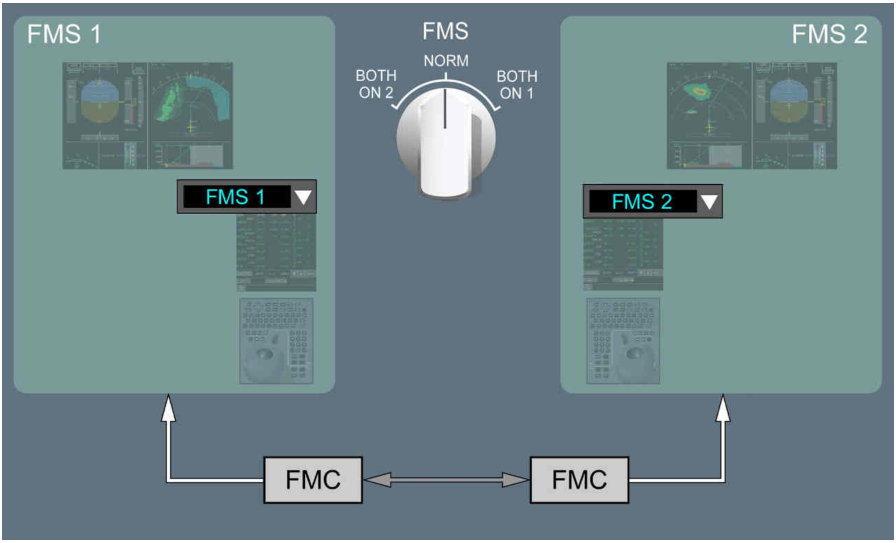


Ident.: DSC-22-FMS-20-70-10-00005223.0001001 / 22 APR 14

NORM

When the FMS selector is set to NORM:
- The data of the FMC that controls FMS 1 is displayed on the side of the Captain
- The data of the FMC that controls FMS 2 is displayed on the side of the First Officer.

FMS Selector Set to NORM



Ident.: DSC-22-FMS-20-70-10-00005224.0001001 / 14 APR 14

BOTH ON 1

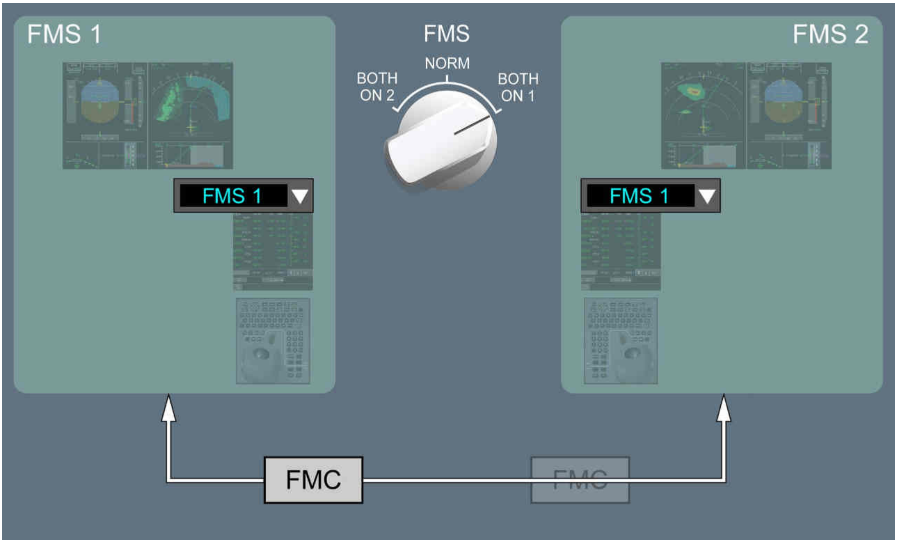
If the flight crew sets the FMS selector to BOTH ON 1, the data of the FMC that controls FMS 1 is displayed on both sides of the cockpit.

After the flight crew sets the FMS selector to BOTH ON 1:
- The MFD of the First Officer displays the ACTIVE/F-PLN page
  The MFD system menu displays the same label as on the MFD of the Captain. The fact that both MFD system menus display the same label indicates that both sides of the cockpit display data that comes from the same FMC.
- The ND of the First Officer displays the OFFSIDE FM CONTROL message
  This message indicates that the active FMC on the side of the Captain provides the FMS data for the side of the First Officer.
- On the EFIS CP of the First Officer, the flight crew can no longer select:
  - The FMS display options: CSTR, WPT, VORD, NDB, and ARPT
  - The ND mode (except the ROSE-VOR and ROSE-LS modes)
  - The ND range (except the ZOOM position).

  The flight crew manages these display options via the EFIS CP of the Captain.

Note: *The ND and VD displays of weather(terrain) data remain operative.*

FMS Selector Set to BOTH ON 1



Ident.: DSC-22-FMS-20-70-10-00005225.0001001 / 14 APR 14

BOTH ON 2

If the flight crew sets the FMS selector to BOTH ON 2, the data of the FMC that controls FMS 2 is displayed on both sides of the cockpit.

After the flight crew sets the FMS selector to BOTH ON 2:
- The MFD of the Captain displays the ACTIVE/F-PLN page
  The MFD system menu displays the same label as on the MFD of the First Officer. The fact that both MFD system menus display the same label indicates that both sides of the cockpit display data that comes from the same FMC.
- The ND of the Captain displays the OFFSIDE FM CONTROL message
  This message indicates that the active FMC on the side of the First Officer provides the FMS data for the side of the Captain.
- On the EFIS CP of the Captain, the flight crew can no longer select:
  - The FMS display options: CSTR , WPT, VORD, NDB, and ARPT
  - The ND mode (except the ROSE-VOR, and ROSE-LS modes)
  - The ND range (except the ZOOM position).

  The flight crew manages these display options via the EFIS CP of the First Officer.

Note: *The ND and VD displays of weather(terrain) data remain operative.*

KCCU CONTROLS FOR THE FMS

Applicable to: ALL

Ident.: DSC-22-FMS-20-30-10-00005101.0001001 / 22 APR 14

There are two Keyboard and Cursor Control Units (KCCUs) on the pedestal:
- One KCCU for the Captain (CAPT)
- One KCCU for the First Officer (F/O).

The flight crew uses the KCCU to:
- Display the FMS pages on the MFD
- Enter and modify data on the MFD FMS pages
- Perform some flight plan revisions on the ND.

The KCCU controls for the FMS are:
- The FMS shortcut keys
- The CLR INFO key
- The ND key and the MFD key
- The navigation keys.

DIR KEY

When pressed:
- Displays the FMS DIRECT TO page on the MFD (*Refer to DSC-22-FMS-20-20-20 DIRECT TO Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

PERF KEY

When pressed:
- Displays the FMS ACTIVE/PERF page (on the panel that corresponds to the active flight phase) on the MFD (*Refer to DSC-22-FMS-20-20-20 PERF Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

INIT KEY

When pressed:
- Displays the FMS ACTIVE/INIT page on the MFD (*Refer to DSC-22-FMS-20-20-20 INIT Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

NAVAID KEY

When pressed:
- Displays the FMS POSITION/NAVAIDS page on the MFD (*Refer to DSC-22-FMS-20-20-20 POSITION/NAVAIDS Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

F-PLN KEY

When pressed:
- Displays the top of the flight plan on the FMS ACTIVE/F-PLN page on the MFD (*Refer to DSC-22-FMS-20-20-20 F-PLN Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

DEST KEY

When pressed:
- Displays the bottom of the destination flight plan on the FMS ACTIVE/F-PLN page on the MFD (*Refer to DSC-22-FMS-20-20-20 F-PLN Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

SEC INDEX KEY

When pressed:
- Displays the FMS SEC INDEX page on the MFD (*Refer to DSC-22-FMS-20-20-20 SEC INDEX Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-22-FMS-20-30-10-00005207.0001001 / 14 APR 14

CLR INFO KEY

When pressed, clears the message that is currently displayed in the FMS message area.

Ident.: DSC-22-FMS-20-30-10-00005208.0001001 / 22 APR 14

ND KEY

When pressed, moves the cursor to the onside ND.
If the ND is not displayed, the ND appears.

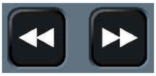
Ident.: DSC-22-FMS-20-30-10-00016537.0001001 / 22 APR 14

MFD KEY

When pressed, the cursor moves to the onside MFD.
If the MFD is not displayed, the MFD appears.

Ident.: DSC-22-FMS-20-30-10-00005209.0001001 / 22 APR 14

NAVIGATION KEYS



Moves the cursor to the next display unit with an interactive format that is to the right, or to the left, of the one that is currently selected.

Overview

OVERVIEW

Applicable to: ALL

Ident.: DSC-22-FMS-20-20-10-10-00002146.0001001 / 22 APR 14

The aircraft has two Multifunction Displays (MFDs):
- One MFD for the Captain (CAPT)
- One MFD for the First Officer (F/O).

The MFD displays FMS textual data on more than 50 FMS pages.
The MFD is interactive. Therefore, the flight crew can move from one FMS page to another, and can display, enter, or modify data via the KCCU.

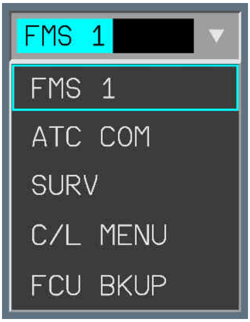
MFD SYSTEM MENU



In order to access the FMS pages, the flight crew selects the FMS identifier in the MFD system menu.
The label of the FMS identifier is different on the MFD of the CAPT and on the MFD of the F/O. In addition, the label of the FMS identifier depends on the FMC that provides data for display on the MFD.
On the MFD of the CAPT:

FMS Identifier	FMC Configuration
FMS 1	Normal configuration: FMC-A provides data for FMS 1.
FMS 1-C	Abnormal configuration: FMC-C provides data for FMS 1.
FMS 2	Abnormal Configuration: The FMS selector is set to BOTH ON 2. FMC-B provides data for FMS 2, and the data from FMS side 2 is displayed on side 1.
FMS 2-C	Abnormal Configuration: The FMS selector is set to BOTH ON 2. FMC-C provides data for FMS 2, and the data from FMS side 2 is displayed on side 1.

On the MFD of the F/O:

FMS Identifier	FMC Configuration
FMS 2	Normal configuration: FMC-B provides data for FMS 2.
FMS 2-C	Abnormal configuration: FMC-C provides data for FMS 2.
FMS 1	Abnormal Configuration: The FMS selector is set to BOTH ON 1. FMC-A provides data for FMS 1, and the data from FMS side 1 is displayed on side 2.
FMS 1-C	Abnormal Configuration: The FMS selector is set to BOTH ON 1. FMC-C provides data for FMS 1, and the data from FMS side 1 is displayed on side 2.

For more information:
- About the FMC configuration, *Refer to DSC-22-FMS-40 Normal Operation*
- About the FMS selector, *Refer to DSC-22-FMS-20-70 FMS Selector*.

Ident.: DSC-22-FMS-20-20-10-10-00002150.0001001 / 22 APR 14

SHARED MESSAGE AREA

The shared message area displays messages in order to inform the flight crew about an event that is related to the FMS or ATC communication.
The shared message area displays the following messages:

D-ATIS RECEIVED	Indicates that a new ATIS report is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS GROUND MSG	Indicates that an ATIS FSM message is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS NO REPLY	Appears when the time-out (7.5 min) is reached and that no ATIS was received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS SEND FAIL	Appears when an ATIS request failed for one of the following reasons: - The sending of the ATIS request failed, or - The time-out (6 min) for acknowledgement is reached, or - A negative answer for the ATIS request is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
CHECK FMS MESSAGE	Indicates that the FMS triggered an amber FMS message. Only appears if the MFD displays a page that is not an FMS page. Disappears when the flight crew accesses an FMS page.

L12

IND	Indicates that both FMS operate in INDEPENDENT mode. For information about the INDEPENDENT mode, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.

L2 Note: *The shared message area displays only one message at a time. However, the IND message can appear in addition to another message.*

Ident.: DSC-22-FMS-20-20-10-10-00002151.0001001 / 22 APR 14

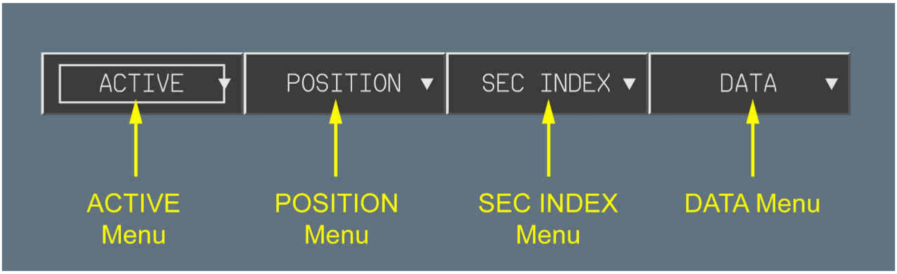
FLIGHT NUMBER

Indicates the flight number that the flight crew entered on the FMS ACTIVE/INIT page (*Refer to DSC-22-FMS-20-20-20 INIT Page*).

Ident.: DSC-22-FMS-20-20-10-10-00002152.0001001 / 22 APR 14

GENERAL MENU BAR

General Menu Bar



The flight crew can access the main FMS pages with the general menu bar. The general menu bar has four menus. Each menu corresponds to one group of main FMS pages.

The four menus of the general menu bar are:
- The ACTIVE menu
- The POSITION menu
- The SEC INDEX menu
- The DATA menu.

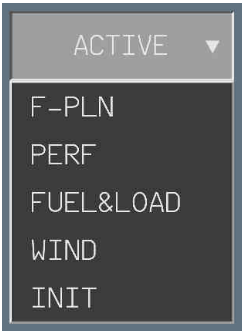
Note: *1. The general menu bar enables the flight crew to directly access the main FMS pages only. The flight crew accesses the other FMS pages via the main FMS pages.*

For example:
- *The flight crew accesses the ACTIVE/F-PLN/OFFSET page via the ACTIVE/F-PLN page*
- *The flight crew accesses the COMPANY T.O DATA REQUEST page via the ACTIVE/INIT page.*

2. A rectangle around the menu name indicates that the displayed page belongs to this menu.

ACTIVE MENU

ACTIVE Menu



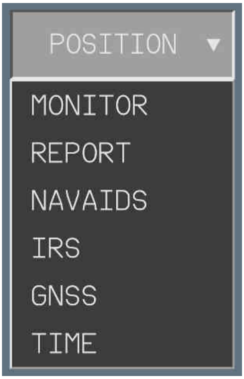
ACTIVE ▼
F-PLN
PERF
FUEL&LOAD
WIND
INIT

The ACTIVE menu groups the main FMS pages that are associated with the active flight plan:

- ACTIVE/F-PLN page (*Refer to page*)
- ACTIVE/PERF page (*Refer to page*)
- ACTIVE/FUEL&LOAD page (*Refer to page*)
- ACTIVE/WIND page (*Refer to page*)
- ACTIVE/INIT page (*Refer to page*).

POSITION MENU

POSITION Menu

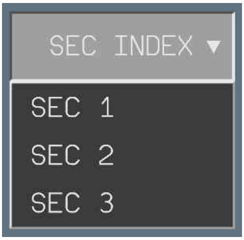


POSITION ▼
MONITOR
REPORT
NAVAIDS
IRS
GNSS
TIME

The POSITION menu groups the main FMS pages that are related to the aircraft position and time data:
- POSITION/MONITOR page (*Refer to page*)
- POSITION/REPORT page (*Refer to page*)
- POSITION/NAVAIDS page (*Refer to page*)
- POSITION/IRS page (*Refer to page*)
- POSITION/GNSS page (*Refer to page*)
- POSITION/TIME page (*Refer to page*).

SEC INDEX MENU

SEC INDEX Menu

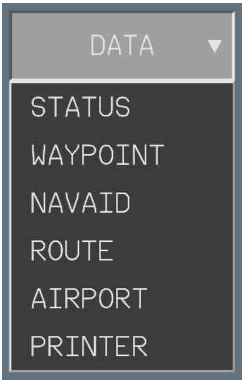


The SEC INDEX menu groups the three secondary flight plans:
- SEC 1
- SEC 2
- SEC 3.

Selecting SEC 1(2)(3) displays the SEC INDEX page with the SEC 1(2)(3) panel opened.
For more information about the SEC INDEX page, *Refer to DSC-22-FMS-20-20-20 SEC INDEX Page*.

DATA MENU

DATA Menu

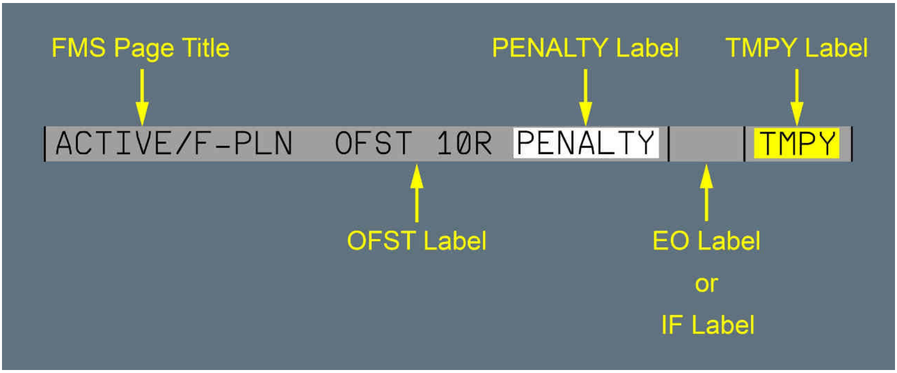


The DATA menu groups the main FMS pages that are related to the databases, the aircraft status, and printer configuration:

- DATA/STATUS page (*Refer to page*)
- DATA/WAYPOINT page (*Refer to page*)
- DATA/NAVAID page (*Refer to page*)
- DATA/ROUTE page (*Refer to page*)
- DATA/AIRPORT page (*Refer to page*)
- DATA/PRINTER page (*Refer to page*).

FMS PAGE HEADER

FMS Page Header



FMS Page Title
PENALTY Label
TMPY Label
ACTIVE/F-PLN
OFST 10R
PENALTY
TMPY
OFST Label
EO Label
or
IF Label

FMS PAGE TITLE

Indicates the title of the displayed FMS page.

The page title contains the different levels of the complete path name. A slash (/) separates each level.

Note: *In the FCOM, in order to simplify the description, the FMS page title that is usually used to refer to an FMS page is the last level of the complete path name. The complete path name is used only if necessary.*

For example:

- *If an information applies to the ACTIVE/F-PLN/OFFSET, SEC1/F-PLN/OFFSET, SEC2/F-PLN/OFFSET, and SEC3/F-PLN/OFFSET pages, the used page title is "OFFSET"*
- *If an information applies only to the ACTIVE/F-PLN/OFFSET page, the used page title is "ACTIVE/F-PLN/OFFSET"*
- *If an information applies only to the SEC1/F-PLN/OFFSET, SEC2/F-PLN/OFFSET, and SEC3/F-PLN/OFFSET pages, the used page title is "SEC/F-PLN/OFFSET"*
- *If an information applies only to the SEC3/F-PLN/OFFSET page, the used page title is "SEC3/F-PLN/OFFSET"*
- *"The flight crew can access the OFFSET page via the F-PLN page" means that the flight crew can access:*
  - *The ACTIVE/F-PLN/OFFSET page via the ACTIVE/F-PLN page*
  - *The SEC1/F-PLN/OFFSET page via the SEC1/F-PLN page*
  - *The SEC2/F-PLN/OFFSET page via the SEC2/F-PLN page*
  - *The SEC3/F-PLN/OFFSET page via the SEC3/F-PLN page.*

OFST LABEL

While the aircraft is on an offset path, the FMS page header displays OFST NNX. The "NN" corresponds to the lateral offset distance, and the "X" corresponds to the offset side (e.g. OFST 10R).

PENALTY LABEL

If the FMS fuel predictions take a FUEL PENALTY factor into account (i.e. the flight crew entered a value in the FUEL PENALTY entry field on the DATA/STATUS page), the FMS page header displays the PENALTY label on the following pages:

- The ALTERNATE page
- The DATA/STATUS page
- The F-PLN page
- The FUEL&LOAD page
- The HOLD page
- The WHAT IF page.

EO LABEL

If the FMS Engine-Out (EO) mode is currently active, the FMS page header displays the EO label.
For more information about the EO mode, *Refer to DSC-22-FMS-10-60 General*.

IF LABEL

If there is a WHAT IF scenario in a specific secondary flight plan, the FMS page header displays the IF label on all of the pages that are associated with this secondary flight plan.
For more information about the WHAT IF function, *Refer to DSC-22-FMS-10-40-40 WHAT IF Function*.

TMPY LABEL

If a temporary flight plan is on standby, the FMS page header displays the TMPY label on the following pages:
- The flight-plan revision pages (e.g. AIRWAYS page)
- The F-PLN page
- The FUEL&LOAD page
- The INIT page
- The PERF page
- The SEC INDEX page
- The WIND page.

For more information about temporary flight plan, *Refer to DSC-22-FMS-10-40-50 Temporary Flight Plan*.

Ident.: DSC-22-FMS-20-20-10-10-00013680.0001001 / 22 APR 14

FMS PAGES

There are more than 50 FMS pages that provide information about the flight plan, the aircraft position, and flight performance.
For the list of the FMS pages, *Refer to DSC-22-FMS-20-20-20 FMS Pages Index*.

Ident.: DSC-22-FMS-20-20-10-10-00013681.0001001 / 22 APR 14

FMS MESSAGE AREA

The FMS message area displays FMS messages.

These messages can be:
- A direct result of a flight crew action, or
- Automatically displayed to inform the flight crew of a specific situation, or to request a flight crew action.

For more information about the FMS messages and the layout of the FMS message area, *Refer to DSC-22-FMS-20-90 General*.

MSG LIST

Ident.: DSC-22-FMS-20-20-20-10-00003749.0001001 / 22 APR 14

REVISED WAYPOINT

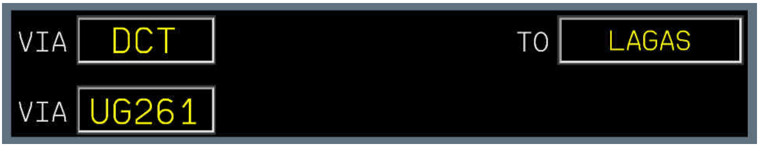
The revised waypoint is the waypoint from which the flight crew selected the AIRWAYS revision.

Ident.: DSC-22-FMS-20-20-20-10-00003750.0001001 / 22 APR 14

VIA ENTRY FIELD

Indicates one of the following:
- The ident of the airway
- DCT.

The flight crew can enter DCT or an airway ident in the VIA entry field.
DCT creates a direct flight leg between the previous waypoint and the following waypoint.
If the VIA entry field contains DCT and the flight crew enters an airway ident in the following VIA entry field, the FMS checks that the waypoint of the TO entry field is part of the airway. In the example below, the FMS checks that LAGAS is part of the UG261 airway.



ENTRY FORMAT

Refer to DSC-22-FMS-20-80 VIA.

Ident.: DSC-22-FMS-20-20-20-10-00003751.0001001 / 22 APR 14

TO ENTRY FIELD

Indicates one of the following:
- The end waypoint of the airway segment
- The end waypoint of the direct flight leg.

WHEN THERE ARE AIRWAYS IN THE VIA ENTRY FIELDS BEFORE AND AFTER THE TO ENTRY FIELD

When the flight crew enters the ident of two airways in the two VIA entry fields that are before and after the TO entry field, the TO entry field displays the shared waypoint of both airways.
L2 If the two entered airways do not have a shared waypoint in the navigation database, the FMS creates a latitude/longitude waypoint at the geographic intersection of the airways. The ident of this waypoint starts with an “X” and is followed by the ident of the second airway (e.g. XUB4).
L1 The flight crew can also manually enter or change the end waypoint of the airway segment.

WHEN THERE IS NO AIRWAY IN THE VIA ENTRY FIELD BEFORE THE TO ENTRY FIELD

In this case, the VIA entry field, that is before the TO entry field, is either empty, or contains DCT.
The flight crew can enter a waypoint in the TO entry field.
When the flight crew enters a waypoint in the TO entry field, if the VIA entry field is empty, the VIA entry field automatically displays DCT.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

Ident.: DSC-22-FMS-20-20-20-10-00003753.0001001 / 22 APR 14

FIXED TURN RADIUS AIRWAY LABEL

Indicates that the flight crew inserted a fixed turn radius airway.
L2 A fixed turn radius airway has a constant turn radius that is defined for one or more waypoints.

Ident.: DSC-22-FMS-20-20-20-10-00003752.0001001 / 22 APR 14

SCROLL BUTTONS

The flight crew uses the scroll down(up) button to move, page by page, downward(upward) through the airway segment list.

Ident.: DSC-22-FMS-20-20-20-10-00003754.0001001 / 22 APR 14

TMPY F-PLN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).
L2 The TMPY F-PLN button is displayed, only if there is a temporary flight plan. If there is no temporary flight plan, the RETURN button is displayed instead of the TMPY F-PLN button. When the flight crew clicks on the RETURN button, the F-PLN page appears.

PURPOSE

On the ALTERNATE page, the flight crew can:

- Access and compare the different alternate airports and the associated information (i.e. company alternate route, distance from the destination airport to the alternate airport, alternate fuel, and EFOB at the alternate airport)
- Enter any other airport (different from the alternate airports that are stored in the navigation database), and access and compare their associated information
- Select any airport, that is displayed on this page, as the alternate airport.

The ALTERNATE page is available for the active and secondary flight plans.

LINKS

For information about the ALTERNATE revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

DESTINATION AIRPORT

Indicates the destination airport.

Ident.: DSC-22-FMS-20-20-20-20-00003757.0001001 / 22 APR 14

SELECTED AREA

Indicates the selected alternate airport.

Also indicates the following information that is associated with the selected alternate airport:
- The company alternate route, if any
- The distance from the destination airport to the alternate airport
- The alternate fuel
- The EFOB at the alternate airport.

Note: *1. The FMS automatically synchronizes the SELECTED area of the ACTIVE/ALTERNATE page and all of the following:*
  - *The ALTN entry field of the ACTIVE/INIT page (Refer to page)*
  - *The ALTN RTE entry field of the ACTIVE/INIT page (Refer to page).*

2. The FMS automatically synchronizes the SELECTED area of the SEC1(2)(3)/ALTERNATE page and all of the following:
  - *The ALTN entry field of the SEC1(2)(3)/INIT page (Refer to page)*
  - *The ALTN RTE entry field of the SEC1(2)(3)/INIT page (Refer to page).*

Ident.: DSC-22-FMS-20-20-20-20-00003759.0001001 / 22 APR 14

DATABASE AREA

Provides the list of all of the alternate airports that are associated with the destination airport, and that are stored in the navigation database (a maximum of 6).
If one of the database alternate airports is the selected alternate airport, the SELECTED label appears next to the airport ident.

For each other database alternate airport, the DATABASE area indicates the following information:
- The company alternate route, if any
- The distance from the destination airport to the alternate airport
- The alternate fuel
- The EFOB at the alternate airport.

When the flight crew clicks on the airport ident button, the database alternate airport menu appears.

The other alternate airport menu has the following options:

- DELETE: Delete the associated airport from the list of the other alternate airports

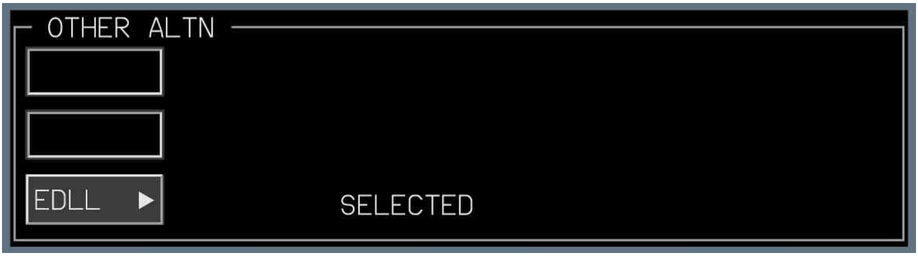
  Note: *The DELETE option is not available, when the associated airport is the selected alternate airport. In order to be able to delete the airport, the flight crew must first deselect the airport (the airport is no longer the selected alternate airport).*

- RTE SELECTION: Displays the ROUTE SELECTION page
  The ROUTE SELECTION page enables the flight crew to select a company route. For more information, *Refer to DSC-22-FMS-20-20-20 ROUTE SELECTION Page*.

  Note: *The RTE SELECTION option is not available, when:*
  - *The associated airport is the selected alternate airport, or*
  - *There is no company route in the navigation database for the associated airport.*

- DATA ARPT: Displays the DATA/AIRPORT page
  The DATA/AIRPORT page provides additional information about the alternate airport. For more information, *Refer to DSC-22-FMS-20-20-20 DATA/AIRPORT Page*.
- SELECT AS ALTN: Selects the associated airport as the new alternate airport, and creates a temporary flight plan.
  If the flight crew selects the associated airport as the alternate airport, the SELECTED label appears next to the airport ident instead of the associated information (i.e. company alternate route, distance, alternate fuel, and EFOB at the alternate airport).

SELECTED Label



ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ALTN.

Ident.: DSC-22-FMS-20-20-20-20-00003761.0001001 / 14 APR 14

CO RTE

Indicates the company alternate route.
If there is no company alternate route, the NONE label is displayed.

Ident.: DSC-22-FMS-20-20-20-20-00003763.0001001 / 22 APR 14

DIST

Indicates the distance between the destination airport and the alternate airport.

The distance between the destination airport and the alternate airport is:
- The distance along the company alternate route, or
- The direct distance, if there is no company alternate route.

Ident.: DSC-22-FMS-20-20-20-20-00003762.0001001 / 14 APR 14

ALTN FUEL ENTRY FIELD

Indicates the alternate fuel.

The alternate fuel is the fuel quantity that is necessary for all of the following:
- The flight between the destination airport and the alternate airport
- The approach and landing at the alternate airport.

The FMS computes the default value.

L2 The computation of the default value is based on the following assumptions:
- The FMS speed mode (ECON/LRC) is LRC (in order to optimize the fuel consumption)
- The cruise flight level is:
  - FL 100, if the distance of the alternate flight plan is less than 100 NM
  - FL 220, if the distance of the alternate flight plan is equal to or more than 100 NM and less than 200 NM
  - FL 310, if the distance of the alternate flight plan is equal to or more than 200 NM.

L1 The flight crew can override the default value.

Note: *1. The FMS automatically synchronizes the ALTN FUEL entry field of the ACTIVE/F-PLN/ALTERNATE page and the ALTN fuel entry field of the ACTIVE/FUEL&LOAD page (Refer to page).*
2. The FMS automatically synchronizes the ALTN FUEL entry field of the SEC1(2)(3)/F-PLN/ALTERNATE page and the ALTN fuel entry field of the SEC1(2)(3)/FUEL&LOAD page (Refer to page).

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ALTN (FUEL).

Ident.: DSC-22-FMS-20-20-20-20-00003764.0001001 / 22 APR 14

EFOB AT ALTN

Indicates the Estimated Fuel On Board (EFOB) at the alternate airport.

Ident.: DSC-22-FMS-20-20-20-20-00003765.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the F-PLN page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-20-00003758.0001001 / 22 APR 14

NO ALTN BUTTON

When clicked, the FMS creates a temporary flight plan without an alternate airport.
The display in the SELECTED area changes accordingly.

No Selected Alternate

PURPOSE

The ARRIVAL page enables the flight crew to insert or change the arrival procedure.
The ARRIVAL page is available for the active and secondary flight plans.

LINKS

For information about the ARRIVAL revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-22-FMS-20-20-20-30-00003767.0001001 / 14 APR 14

ACCESS

The flight crew can access the ARRIVAL page via the F-PLN page, by:

- Clicking on the destination airport ident

Destination Airport Ident

This area displays the parameters of the selected arrival procedure.

L2 The information appears in green, if the arrival information is part of the active flight plan. It appears in yellow, if the FMS created a temporary flight plan after the flight crew selected or changed the arrival procedure.

Note: If there is temporary flight plan that was created by a revision other than the ARRIVAL revision, the information is displayed in green.

The information is displayed in white for the secondary flight plans.

L1 All fields, except TO, display dashes, if the flight crew did not make any selection.

TO

Indicates the ident of the:
- Destination airport, if the flight crew displays the ARRIVAL page for the destination flight plan
- Alternate airport, if the flight crew displays the ARRIVAL page for the alternate flight plan.

LS

Indicates the ident of the landing system of the approach that the flight crew selected.

RWY

Indicates the runway of the approach that the flight crew selected.

LENGTH

Indicates the navigation database runway length of the selected arrival runway.

CRS

Indicates the navigation database runway course of the selected arrival runway.

APPR

Indicates the approach that the flight crew selected from the APPR list (*Refer to APPR Button*).

FREQ/CHAN

Indicates the frequency or channel of the landing system of the approach that the flight crew selected.

VIA

Indicates the approach transition (VIA) that the flight crew selected from the VIA list (*Refer to VIA Button*).

STAR

Indicates the STAR that the flight crew selected from the STAR list (*Refer to STAR Button*).

TRANS

Indicates the arrival TRANS that the flight crew selected from the TRANS list (*Refer to TRANS Button*).

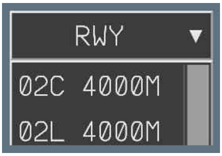
Ident.: DSC-22-FMS-20-20-20-30-00003769.0001001 / 22 APR 14

RWY BUTTON

When clicked, displays the RWY list.

The RWY list displays:
- All of the runways that are compatible with the current destination airport
- The length of each runway.

RWY List



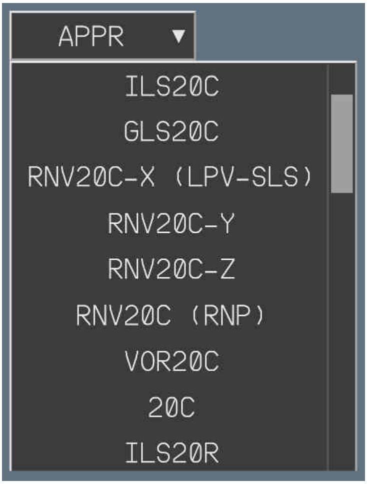
When the flight crew selects a runway, the FMS creates(updates) a temporary flight plan with a default leg of 5 NM on the axis of the selected runway, and completes(updates) the following fields in the SELECTED ARRIVAL area:
- RWY
- LENGTH
- CRS.

Ident.: DSC-22-FMS-20-20-20-30-00003770.0002001 / 14 APR 16

APPR BUTTON

When clicked, displays the APPR list.
The APPR list displays all of the approaches that are compatible with the current destination airport.
The approaches are sorted by runway.

APPR List



The approach types are indicated as follows (The runway 20C is used as an example):

	ILS20C	The approach is an ILS approach.
L2	ILS20C (RNP)	The approach is an ILS approach. The associated missed approach is part of an RNP AR procedure.
L1	GLS20C	The approach is a GLS ◁ approach.
L2	GLS20C (RNP)	The approach is an GLS ◁ approach. The associated missed approach is part of an RNP AR procedure.

L12 RNV20C (LPV-SLS) or RNV20C-X (LPV-SLS)	(The "-X" corresponds to the letter that identifies the approach.) The approach is an RNAV (GNSS) approach with LPV minima. *Note:* *If the associated missed approach is part of an RNP AR procedure, the RNAV (GNSS) approach with LPV minima appears in the APPR list with only the (LPV-SLS) label. There is no (RNP) label.*
L3 IGS20C	The approach is an IGS approach.
L1 LOC20C	The approach is a LOC only approach.
BAC20C	The approach is a LOC B/C approach.
L3 LDA20C	The approach is an LDA approach.
SDF20C	The approach is a SDF approach.
L12 GPS20C or GPS20C-X	(The "-X" corresponds to the letter that identifies the approach.) The approach is an RNAV (GNSS) approach: • With LNAV/VNAV minima , or • With LNAV minima, or • To be flown in visual meteorological conditions.
L12 RNV20C or RNV20C-X	(The "-X" corresponds to the letter that identifies the approach.) The approach is an RNAV (GNSS) approach: • With LNAV/VNAV minima , or • With LNAV minima, or • To be flown in visual meteorological conditions.
L12 RNV20C (RNP)	The approach is an RNAV (RNP) approach. *Note:* *There is also the (RNP) label, if only the associated missed approach is part of an RNP AR procedure, and the approach is not an RNAV (GNSS) approach with LPV minima.*
L1 VOR20C	The approach is a VOR or VOR/DME approach.
L13 NDB20C	The approach is an NDB or NDB/DME approach. If the aircraft does not have an ADF receiver, the NDB approaches are not part of the list.

L12

20C	The approach is a visual approach. When the flight crew selects the runway itself (i.e. 20C), a default leg of 5 NM in the runway axis is created.

When the flight crew selects an approach, the FMS creates(updates) a temporary flight plan, and completes(updates) the following fields in the SELECTED ARRIVAL area:
- APPR
- LS
- FREQ/CHANI
- RWY
- LENGTH
- CRS.

Ident.: DSC-22-FMS-20-20-20-30-00003771.0001001 / 22 APR 14

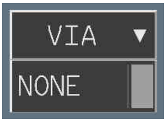
VIA BUTTON

When clicked, displays the VIA list.

L2 *Note:* *The flight crew can displays the VIA list, only if the flight crew previously selected an approach.*

L1 The VIA list displays all of the VIAs that are compatible with the approach and the STAR that the flight crew selected. If the flight crew selected no STAR, the VIA list displays all of the VIAs that are compatible with the approach that the flight crew selected.
The first option in the VIA list is NONE.
If a VIA is part of an RNP AR procedure, the (RNP) label appears next to the VIA ident.

VIA List



L2 *Note:* *The NONE option is automatically selected, if all of the following occur:*
- *The flight crew selects an approach and a STAR*
- *There is no compatible VIA.*

L1 When the flight crew selects a VIA or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the VIA field in the SELECTED ARRIVAL area.

Ident.: DSC-22-FMS-20-20-20-30-00003772.0001001 / 22 APR 14

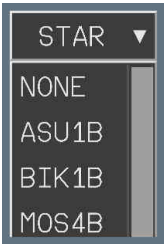
STAR BUTTON

When clicked, displays the STAR list.

L2 *Note:* *The flight crew can display the STAR list, only if the flight crew previously selected an approach.*

L1 The STAR list displays all of the STARs that are compatible with the approach that the flight crew selected.
The first option in the STAR list is NONE.

STAR List



L2 *Note:* *The NONE option is automatically selected, if the flight crew selects an approach and no STAR is available.*

L1 When the flight crew selects a STAR or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the STAR field in the SELECTED ARRIVAL area.

Ident.: DSC-22-FMS-20-20-20-30-00003773.0001001 / 22 APR 14

TRANS BUTTON

When clicked, displays the TRANS list.

L2 *Note:* *The flight crew can displays the TRANS list, only if a STAR is selected.*

L1 The TRANS list displays all of the TRANS that are compatible with the selected STAR.
The first option in the TRANS list is NONE.

TRANS List

L2 *Note:* *The NONE option is automatically selected, if the flight crew selects a STAR and no TRANS is available.*

L1 When the flight crew selects a TRANS or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the TRANS field in the SELECTED ARRIVAL area.

Ident.: DSC-22-FMS-20-20-20-30-00003774.0001001 / 22 APR 14

TMPY F-PLN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).

L2 The TMPY F-PLN button is displayed, only if there is a temporary flight plan. If there is no temporary flight plan, the RETURN button is displayed instead of the TMPY F-PLN button. When the flight crew clicks on the RETURN button, the F-PLN page appears.

Ident.: DSC-22-FMS-20-20-20-40-00003775.0001001 / 22 APR 14

PURPOSE

On the CLOSEST AIRPORTS page, the flight crew can:

- Access the four closest airports and their associated data (i.e. distance, bearing, ETA, EFOB, and effective wind)
  L2 The airports are ranked in increasing order of distance from the current aircraft position
- L1 Display the same data for another desired airport.

The CLOSEST AIRPORTS page is available for the active flight plan only.

LINKS

For information about the CLOSEST AIRPORTS function, *Refer to DSC-22-FMS-10-40-40 CLOSEST AIRPORTS Function*.

Ident.: DSC-22-FMS-20-20-20-40-00003776.0001001 / 14 APR 14

ACCESS

The flight crew can access the CLOSEST AIRPORT page via the ACTIVE/F-PLN page, by selecting CLOSEST AIRPORTS in the F-PLN INFO menu.

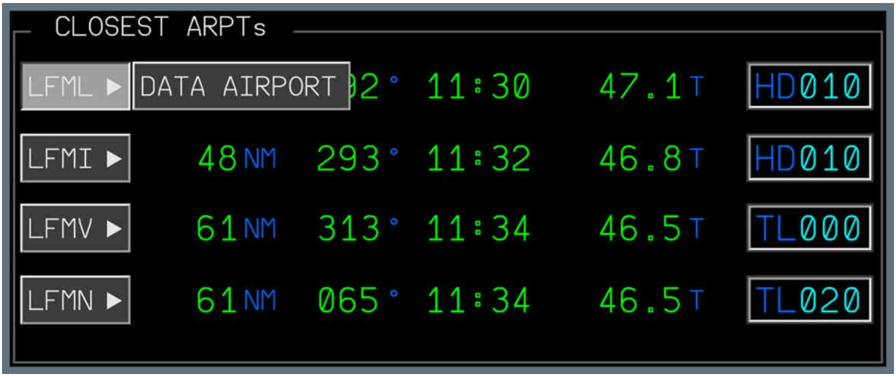
AIRPORT IDENT

Indicates the airport ident.
When the flight crew clicks on the airport ident button, the closest airport menu appears.

Closest Airport Menu



CLOSEST ARPTs

LFML ▶	DATA AIRPORT		2 °	11:30	47.1 T	HD010
LFMI ▶		48 NM	293 °	11:32	46.8 T	HD010
LFMV ▶		61 NM	313 °	11:34	46.5 T	TL000
LFMN ▶		61 NM	065 °	11:34	46.5 T	TL020

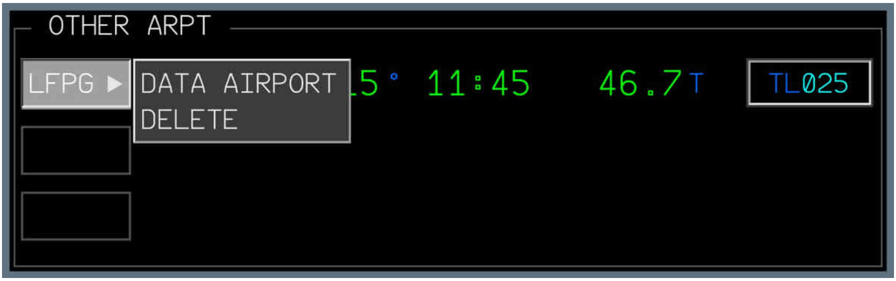
The closest airport menu has one option: DATA AIRPORT. When the flight crew selects DATA AIRPORT, the DATA/AIRPORT page appears.
The DATA/AIRPORT page provides additional information about the airport. For more information, *Refer to DSC-22-FMS-20-20-20 DATA/AIRPORT Page*.

Ident.: DSC-22-FMS-20-20-20-40-00003777.0001001 / 22 APR 14

OTHER ARPT AREA

The flight crew can manually enter up to three airport idents in order to display the associated data (i.e. distance, bearing, ETA, EFOB, and effective wind).
Then, the flight crew can compare this data with the closest airports that are computed by the FMS.
When the flight crew clicks on the airport ident button, the other closest airport menu appears.

Other Closest Airport Menu



OTHER ARPT

LFPG ▶	DATA AIRPORT DELETE	5 °	11:45	46.7 T	TL025

The other closest airport menu has the following options:
- DATA AIRPORT: Displays the DATA/AIRPORT page
  The DATA/AIRPORT page provides additional information about the airport. For more information, *Refer to DSC-22-FMS-20-20-20 DATA/AIRPORT Page*.
- DELETE: Delete the associated airport from the list of the other closest airports.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 AIRPORT (ARPT).

Ident.: DSC-22-FMS-20-20-20-40-00003779.0001001 / 22 APR 14

DIST

Indicates the direct distance between the current aircraft position and the airport.

Ident.: DSC-22-FMS-20-20-20-40-00003780.0001001 / 14 APR 14

BRG

Indicates the bearing from the current aircraft position to the airport.

Note: *The displayed bearing corresponds to the MAG/TRUE selection by the flight crew.*

Ident.: DSC-22-FMS-20-20-20-40-00003781.0001001 / 22 APR 14

UTC(TIME)

Indicates the Estimated Time of Arrival (ETA), in UTC(flight) time, at the airport.
The ETA is computed in the CRZ flight phase only.

L2 *Note:* *The ETA that is displayed on the CLOSEST AIRPORTS page is based on the following:*
- *Current aircraft gross weight*
- *Flight from the current aircraft position to the ground*
- *Great-circle distance and bearing to the airport*
- *Current CRZ FL*
- *Constant ISA DEV that is equal to the current aircraft ISA DEV*
- *Entered or computed effective wind along the bearing*
- *Current FMS speed mode (ECON/LRC).*

L1 The UTC(TIME) label indicates the time reference:
- The UTC label indicates that the time reference is the UTC time
- The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:

- In the PREFLIGHT flight phase:
  - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - If the UTC time is valid, the time reference is the UTC time
  - If the UTC time is not valid, the time reference is the flight time.

Ident.: DSC-22-FMS-20-20-20-40-00003782.0001001 / 22 APR 14

EFOB

Indicates the Estimated Fuel On Board (EFOB) at the airport.
The EFOB is computed in CRZ flight phase only.

L2 *Note:* *The EFOB that is displayed on the CLOSEST AIRPORTS page is based on the following:*

- *Current aircraft gross weight*
- *Flight from the current aircraft position to the ground*
- *Great-circle distance and bearing to the airport*
- *Current CRZ FL*
- *Constant ISA DEV that is equal to the current aircraft ISA DEV*
- *Entered or computed effective wind along the bearing*
- *Current FMS speed mode (ECON/LRC).*

Ident.: DSC-22-FMS-20-20-20-40-00003783.0001001 / 22 APR 14

EFF WIND ENTRY FIELD

Indicates a headwind or tailwind for the associated airport route.
The FMS computes and displays a default wind that is based on the wind data that is entered by the flight crew.
The flight crew can overwrite the default value at any time.
The FMS uses the effective wind to compute the time and EFOB predictions for the airports.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 EFF WIND.

Ident.: DSC-22-FMS-20-20-20-40-00003784.0001001 / 22 APR 14

PURPOSE

On the COMPANY F-PLN REQUEST page, the flight crew can send a flight plan request to the company ground station.
Before engine start, a performance data request is associated with the flight plan request.

L2 The request is always associated with the active or secondary flight plan from which the request is sent.
After engine start, the flight crew can send a flight plan request only from one of the secondary flight plans.

L1 The COMPANY F-PLN REQUEST page is available for the active and secondary flight plans.

Ident.: DSC-22-FMS-20-20-20-60-00003791.0001001 / 14 APR 14

ACCESS

The flight crew can access the COMPANY F-PLN REQUEST page via the INIT page, by clicking on the CPNY F-PLN REQUEST button.

CPNY RTE

Indicates the company route of the requested flight plan.
If the flight crew performs the F-PLN request from one of the SEC pages, the default value is the company route of the secondary flight plan, if there is one. The flight crew can overwrite the default value at any time.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 CPNY RTE.

Ident.: DSC-22-FMS-20-20-20-60-00003794.0001001 / 22 APR 14

FREE TEXT ENTRY FIELD

The flight crew can enter a free text of up to 24 characters in the entry field. The free text is sent with the flight plan request to the company ground station.
If the free text AMI option is not activated, the FREE TEXT entry field is not available.

ENTRY FORMAT

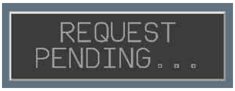
Refer to DSC-22-FMS-20-80 FREE TEXT.

Ident.: DSC-22-FMS-20-20-20-60-00003795.0001001 / 22 APR 14

SEND F-PLN REQUEST BUTTON

When clicked, sends the F-PLN and performance data request to the company ground station (via ACARS).

L2 During the request transmission to the Avionics Communication Router (ACR), the button label is REQUEST PENDING... .



Ident.: DSC-22-FMS-20-20-20-60-00003796.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the page that was displayed before the COMPANY F-PLN REQUEST page.

PURPOSE

On the COMPANY T.O DATA REQUEST page, the flight crew can request takeoff data (for two different runways) to the company ground station.
The flight crew may also enter additional takeoff parameters that will be sent with the request, and used for the takeoff data computation on ground.

The COMPANY T.O DATA REQUEST page is available for the active flight plan only.

ACCESS

The flight crew can access the COMPANY T.O DATA REQUEST page, via:

- The ACTIVE/INIT page, by clicking on the CPNY T.O REQUEST button

REQUEST FOR RWY ENTRY FIELD

Indicates the runway for which the takeoff data is requested.
If a departure runway is defined in the active flight plan, the ident of this departure runway is automatically entered in the entry field. The flight crew can overwrite the automatically-selected ident at any time.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 RWY.

Ident.: DSC-22-FMS-20-20-20-70-00003800.0001001 / 22 APR 14

RWY SCROLL BUTTONS

The flight crew uses the RWY scroll buttons to scroll through both requested runway pages.

Ident.: DSC-22-FMS-20-20-20-70-00003801.0001001 / 22 APR 14

RWY PAGE NUMBER

Indicates the rank of the requested runway page.

Ident.: DSC-22-FMS-20-20-20-70-00003808.0001001 / 22 APR 14

T.O SHIFT ENTRY FIELD

Indicates the runway takeoff shift.
The runway takeoff shift is the distance between the runway threshold, and the position at which the flight crew releases the aircraft brakes in order to take off.
The default value is the takeoff shift of the T.O panel on the PERF page. The flight crew can overwrite an automatically-selected takeoff shift at any time.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 T.O SHIFT.

Ident.: DSC-22-FMS-20-20-20-70-00003809.0001001 / 22 APR 14

T.O LIMIT ENTRY FIELD

Indicates the limited runway length for takeoff (i.e. the runway length that is really available for takeoff).

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 T.O LIMIT.

Ident.: DSC-22-FMS-20-20-20-70-00003802.0001001 / 22 APR 14

TOW, T.O CG, AND TEMP

Indicate the aircraft takeoff weight, aircraft takeoff CG, and takeoff temperature.
The takeoff weight is the FMS value that is displayed in the TOW field on the ACTIVE/FUEL&LOAD page (*Refer to page*).
The FQMS provides the takeoff CG.
The takeoff temperature is the current static temperature value, provided by the ADIRS.

Ident.: DSC-22-FMS-20-20-20-70-00003803.0001001 / 22 APR 14

MAG WIND ENTRY FIELDS

Indicate the wind direction and wind speed at takeoff.
The wind direction and wind speed at takeoff are those that are defined at the departure airport on the CLB panel of the WIND page (*Refer to page*). The flight crew can overwrite the default values at any time.

L2 If the airport reference is true north, the wind is the true wind. The label next to the entry fields is TRUE WIND instead of MAG WIND.

L1 ENTRY FORMAT

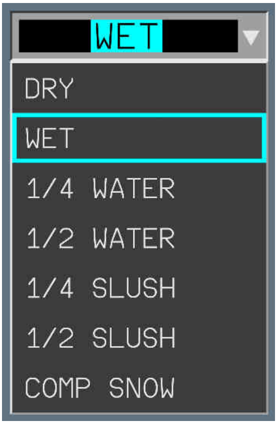
For the entry format of:
- Wind direction, *Refer to DSC-22-FMS-20-80 WIND DIRECTION*
- Wind speed, *Refer to DSC-22-FMS-20-80 WIND SPEED*.

Ident.: DSC-22-FMS-20-20-20-70-00003804.0001001 / 22 APR 14

RWY COND LIST

Indicates the runway condition at takeoff.
The flight crew selects the runway condition from the RWY COND list.

RWY COND List



Ident.: DSC-22-FMS-20-20-20-70-00003805.0001001 / 22 APR 14

QNH ENTRY FIELD

Indicates the selected QNH at takeoff.

The QNH that is selected on the EFIS CP is displayed by default. The flight crew can overwrite the default value at any time.

ENTRY FORMAT

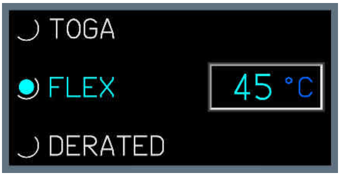
Refer to DSC-22-FMS-20-80 QNH(QFE).

Ident.: DSC-22-FMS-20-20-20-70-00003806.0001001 / 03 JAN 19

T.O THRUST OPTION LIST

To select the desired takeoff thrust, the flight crew selects one of the following options
- TOGA, for TOGA thrust (default setting)
- FLEX, for FLX thrust
  When selected, displays the FLEX entry field. The flight crew enters the FLEX temperature in the FLEX entry field.

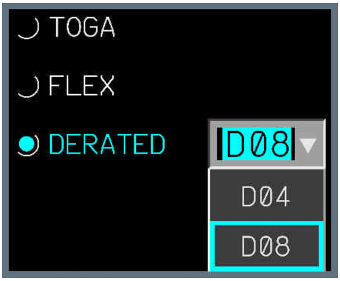
FLEX Entry Field



○ TOGA
● FLEX 45 °C
○ DERATED

- DERATED, for DTO thrust.
  When selected, displays the DERATED list. The flight crew enters the derated thrust level via the keyboard, or by selecting the derated thrust level from the DERATED list.

DERATED List



○ TOGA
○ FLEX
● DERATED D08

ENTRY FORMAT

For the entry format of:
- FLEX temperature, *Refer to DSC-22-FMS-20-80 FLEX*
- Derated thrust level, *Refer to DSC-22-FMS-20-80 DERATED T.O*.

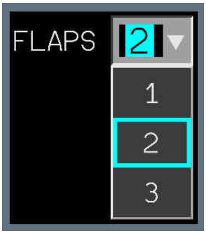
Ident.: DSC-22-FMS-20-20-20-70-00003807.0001001 / 22 APR 14

FLAPS LIST

Indicates the flaps setting for takeoff.
The default setting is the flaps setting of the T.O panel on the PERF page.

The flight crew can overwrite the default value at any time, by:
- Entering the flaps setting via the keyboard, or
- Selecting the flaps setting from the FLAPS list.

FLAPS List



ENTRY FORMAT

Refer to DSC-22-FMS-20-80 FLAPS.

Ident.: DSC-22-FMS-20-20-20-70-00003810.0001001 / 22 APR 14

FREE TEXT ENTRY FIELD

The flight crew can enter a free text of a up to 24 characters in the entry field. The free text is sent with the T.O data request to the company ground station.
If the free text AMI option is not activated, the FREE TEXT entry field is not available.

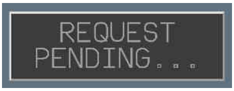
ENTRY FORMAT

Refer to DSC-22-FMS-20-80 FREE TEXT.

Ident.: DSC-22-FMS-20-20-20-70-00003811.0001001 / 22 APR 14

SEND T.O REQUEST BUTTON

When clicked, sends the T.O data request to the company ground station (via ACARS).
L2 During the request transmission to the Avionics Communication Router (ACR), the button label is REQUEST PENDING... .



Ident.: DSC-22-FMS-20-20-20-70-00003813.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the page that was displayed before the COMPANY T.O DATA REQUEST page.

Ident.: DSC-22-FMS-20-20-20-70-00003812.0001001 / 22 APR 14

PURPOSE

On the COMPANY WIND DATA REQUEST page, the flight crew can send a wind request to the company ground station.

L2 The content of the wind request message depends on the flight phase that the aircraft currently flies:

- In PREFLIGHT or T.O flight phase: Request for climb, cruise, descent, and alternate wind data
- In CLB or CRZ flight phase: Request for cruise, descent, and alternate wind data.

L1 When the aircraft is in DES, APPR, or GA flight phase, no wind request is possible.
If the free text AMI option is not activated, the COMPANY WIND DATA REQUEST page is not available. In this case, the flight crew sends the wind request by clicking on the CPNY WIND REQUEST button on the INIT or WIND page.
The COMPANY WIND DATA REQUEST page is available for the active and secondary flight plans.

Ident.: DSC-22-FMS-20-20-20-80-00003815.0001001 / 14 APR 14

ARPT IDENT ENTRY FIELD [DATABASE ARPTs]

The flight crew enters the ident of an airport in the entry field.

L2 If the entered airport is a pilot-stored airport, the PILOT STORED RWYs panel opens, and displays the associated airport data.

If the entered airport is neither a navigation database nor a pilot-stored airport, the PILOT STORED RWYs panel opens, and displays the NEW RWY function (*Refer to NEW RWY Function*).

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 AIRPORT (ARPT).

Ident.: DSC-22-FMS-20-20-20-90-00003823.0001001 / 14 APR 14

AIRPORT NAME AND COORDINATES

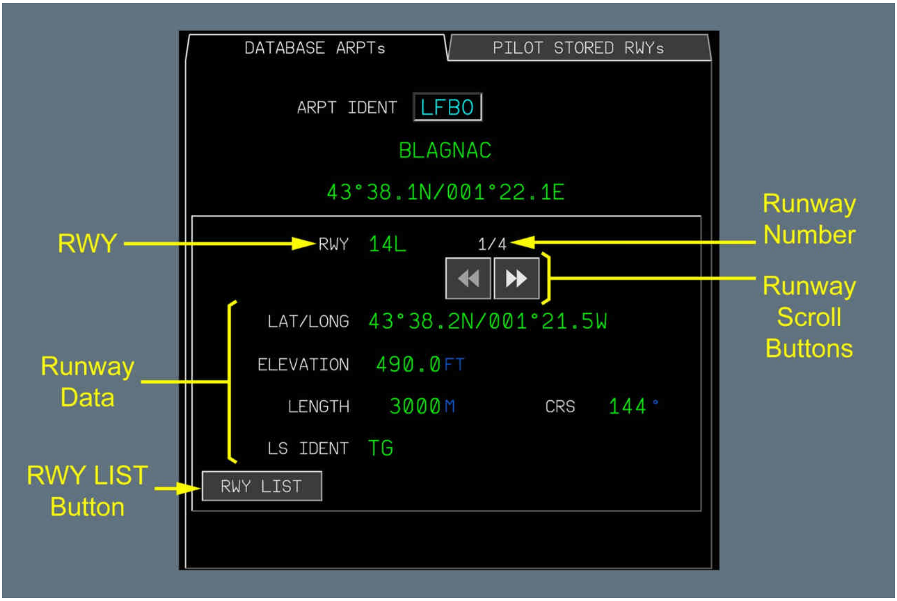
Indicates the name and the latitude/longitude coordinates of the navigation database airport.

Ident.: DSC-22-FMS-20-20-20-90-00003824.0001001 / 22 APR 14

RUNWAY BUTTONS

Indicate all of the runways that are associated with the navigation database airport.
When the flight crew clicks on a runway button, the runway data area appears instead of the runway buttons. The runway data area displays additional data for the associated runway.

Runway Data Area



ARPT IDENT LFBO
BLAGNAC
43°38.1N/001°22.1E
RWY 14L 1/4
LAT/LONG 43°38.2N/001°21.5W
ELEVATION 490.0FT
LENGTH 3000M CRS 144°
LS IDENT TG

RWY

Indicates the ident of the displayed runway.

RUNWAY NUMBER

Indicates the rank of the displayed runway, and the total number of runways that are associated with the selected airport.

RUNWAY SCROLL BUTTONS

The flight crew uses the runway scroll buttons to scroll, one by one, through the runways of the selected airport.

RUNWAY DATA

Indicates:
- The latitude and longitude of the runway threshold
- The runway elevation
- The runway length
- The runway course

L2 The T letter indicates that the course is defined in the true north reference.

L1
- The landing system that is associated with the runway, if there is one.

RWY LIST BUTTON

When clicked, displays the runway buttons.

Ident.: DSC-22-FMS-20-20-20-90-00003827.0001001 / 14 APR 14

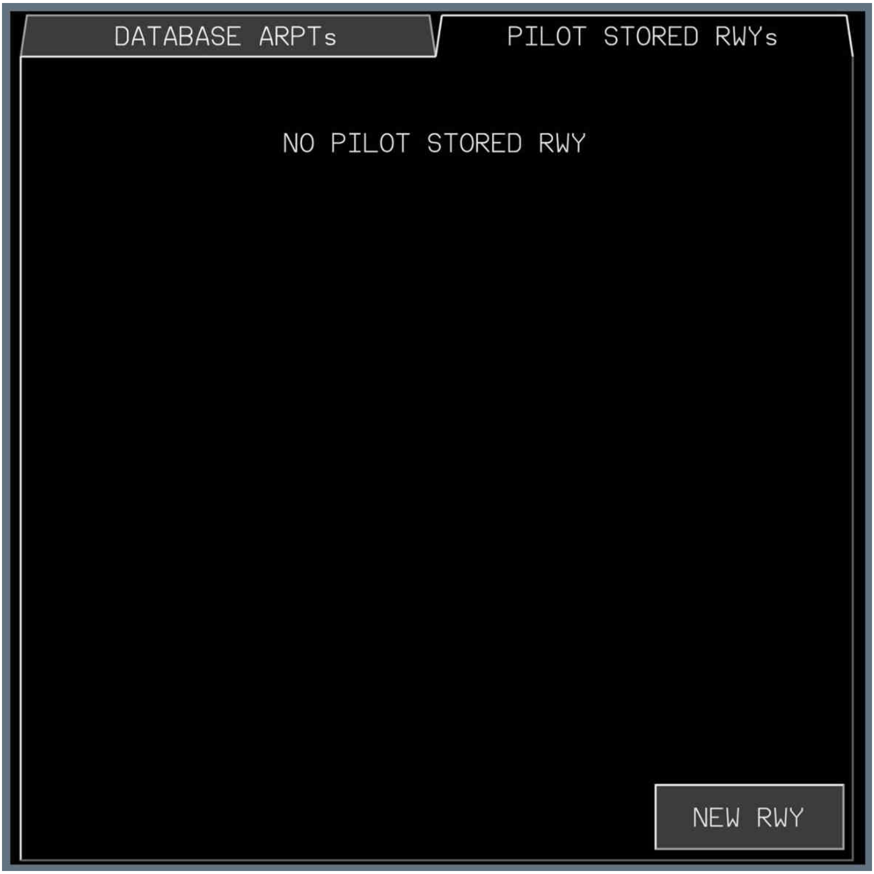
ARPT IDENT LIST

Indicates the ident of the displayed pilot-stored airport.
The flight crew enters the ident of the pilot-stored airport via the keyboard, or by selecting the ident of the pilot-stored airport from the ARPT IDENT list.
The ARPT IDENT list displays all of the airports that are associated with the pilot-stored runways.

NO PILOT-STORED RUNWAY IN THE PILOT-STORED ELEMENTS DATABASE

If there is no pilot-stored runway in the pilot-stored elements database, the PILOT STORED RWYs panel displays the NO PILOT STORED RWY message.

NO PILOT STORED RWY Message



NO PILOT STORED RWY

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 AIRPORT (ARPT).

Ident.: DSC-22-FMS-20-20-20-90-00003828.0001001 / 22 APR 14

RUNWAY NUMBER

Indicates the rank of the displayed pilot-stored runway, and the total number of pilot-stored runways.
The pilot-stored elements database has a maximum of 10 runways.

Ident.: DSC-22-FMS-20-20-20-90-00003829.0001001 / 22 APR 14

RUNWAY SCROLL BUTTONS

The flight crew uses the runway scroll buttons to scroll, one by one, through the pilot-stored runways.

Ident.: DSC-22-FMS-20-20-20-90-00005206.0001001 / 22 APR 14

RWY

Indicates the runway ident of the displayed pilot-stored runway.

Ident.: DSC-22-FMS-20-20-20-90-00003830.0001001 / 22 APR 14

RUNWAY DATA

Indicates:
- The latitude and longitude of the runway threshold
- The runway elevation
- The runway length
- The runway course

L2 The T letter indicates that the course is defined in the true north reference.

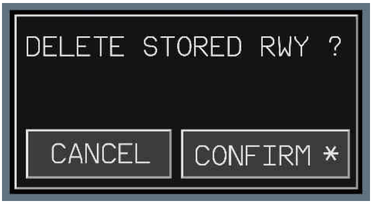
L1
- The landing system that is associated with the runway, if there is one.

Ident.: DSC-22-FMS-20-20-20-90-00003832.0001001 / 22 APR 14

DELETE STORED RWY BUTTON

When clicked, deletes the pilot-stored runway that is currently displayed.
The flight crew must perform a confirmation action.

Confirmation Window



DELETE STORED RWY ?

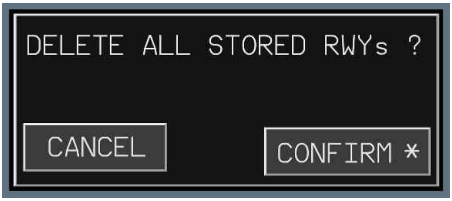
If the pilot-stored runway is still used by the FMS, it is not deleted. The FMS message area displays the F-PLN ELEMENT RETAINED message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-90-00003831.0001001 / 22 APR 14

DELETE ALL STORED RWYS BUTTON

When clicked, deletes all pilot-stored runways.
The flight crew must perform a confirmation action.

Confirmation Window



DELETE ALL STORED RWYs ?

If there are pilot-stored runways that are still used by the FMS, they are not deleted. The FMS message area displays the F-PLN ELEMENT RETAINED message (*Refer to message*) .

L2 The Operator can decide (via the AMI file) to automatically delete all pilot-stored elements, when the DONE flight phase becomes active.

Ident.: DSC-22-FMS-20-20-20-90-00003833.0001001 / 22 APR 14

Ident.: DSC-22-FMS-20-20-20-90-00003837.0001001 / 22 APR 14

RUNWAY DATA ENTRY FIELDS

The flight crew enters:
- The ident of the new runway
- The latitude and longitude of the runway threshold
- The runway elevation
- The runway length
- The runway course, if both latitude and longitude are defined
- The landing system that is associated with the runway, if there is one.

The flight crew must enter all runway data (except the landing system) in order to define a new runway.

ENTRY FORMAT

For the entry format of:
- Runway ident, *Refer to DSC-22-FMS-20-80 RWY*
- Latitude, *Refer to DSC-22-FMS-20-80 LAT*
- Longitude,*Refer to DSC-22-FMS-20-80 LONG*
- Runway elevation, *Refer to DSC-22-FMS-20-80 RWY ELEVATION*
- Runway length, *Refer to DSC-22-FMS-20-80 RWY LENGTH*
- Runway course, *Refer to DSC-22-FMS-20-80 RWY CRS*
- Landing system, *Refer to DSC-22-FMS-20-80 LS IDENT*.

Ident.: DSC-22-FMS-20-20-20-90-00003838.0001001 / 22 APR 14

STORE RWY BUTTON

When clicked, stores the new runway in the pilot-stored elements database.
The pilot-stored elements database is limited to 10 runways.

L2 If the pilot-stored elements database is full, the first-created runway that is not part of the flight plan is deleted. If the FMS uses all of the 10 runways, the runway creation is rejected, and the FMS message area displays the 10 RWYs MAX : ALL IN USE message (*Refer to message*).

L3 If the flight crew accesses the PILOT STORED RWYs panel from the PILOTS STORED NAVAID panel of the DATA/NAVAID page, the STORE RWY+NAVAID button appears instead of the STORE RWY button.

NAVAID IDENT ENTRY FIELD [DATABASE NAVAIDS]

The flight crew enters the ident of a navaid in the entry field.

L2 If the entered navaid is a pilot-stored navaid, the PILOT STORED NAVAIDS panel opens, and displays the associated data.

If the entered navaid is neither a navigation database nor a pilot-stored navaid, the PILOT STORED NAVAIDS panel opens, and displays the NEW NAVAID function (*Refer to NEW NAVAID Function*).

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 NAVAID IDENT.

Ident.: DSC-22-FMS-20-20-20-100-00003844.0002001 / 14 APR 16

NAVAID DATA [DATABASE NAVAIDS]

Indicates:

- The class

L2 The class can be one of the following:

- VOR
- DME
- LOC
- ILS
- GLS ◁✳
- NDB
- ILS/DME
- VOR/DME.

L1 - The latitude/longitude coordinates
- The elevation

L2 This data is not displayed for VOR and NDB.

L1 - The ident of the runway that is associated with the navaid

L2 This data is displayed only for landing systems.

L1 - The magnetic declination

L2 This data is displayed only for VOR and VOR/DME.

L1 - The frequency
- The approach category

L2 The category can be 1, 2, or 3.

L1 - The figure of merit that indicates the maximum tuning distance of the navaid

L2 The figure of merit can be one of the following:
- 0 (40 NM)
- 1 (70 NM)
- 2 (130 NM)
- 3 (250 NM).

L1 - The course.
L2 This data is displayed only for the landing systems.
The T letter indicates that the course is defined in the true north reference.

Ident.: DSC-22-FMS-20-20-20-100-00003847.0001001 / 22 APR 14

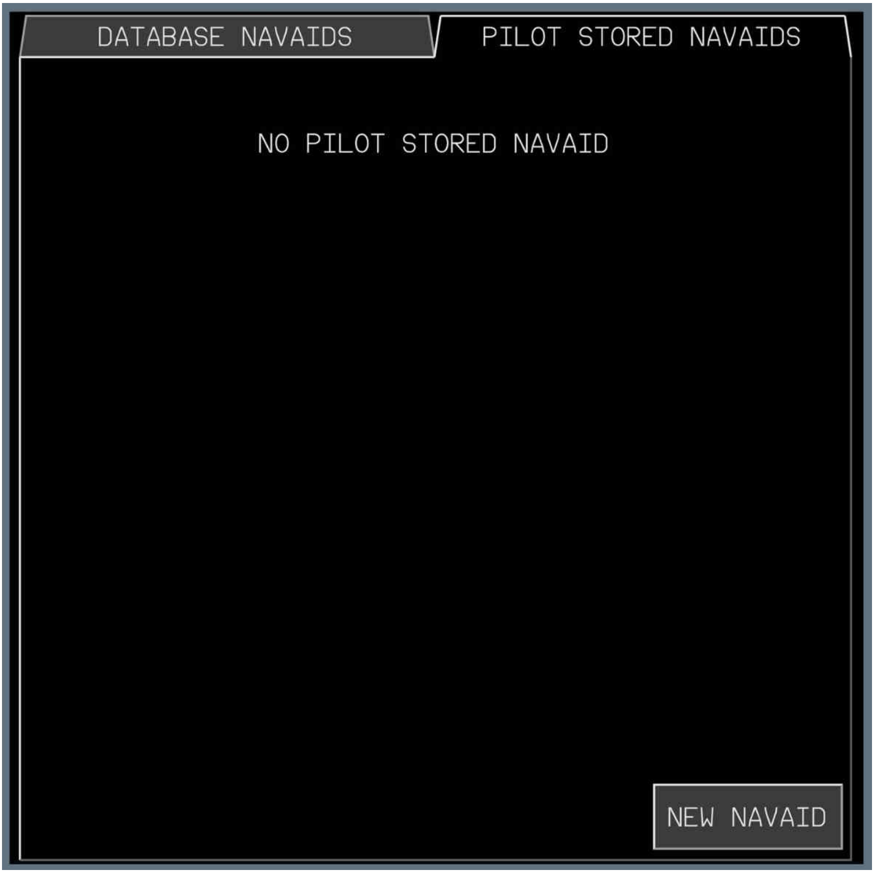
NAVAID IDENT LIST

Indicates the ident of the displayed pilot-stored navaid.
The flight crew enters the ident of the pilot-stored navaid via the keyboard, or by selecting the ident of the pilot-stored navaid from the NAVAID IDENT list.
The NAVAID IDENT list displays all pilot-stored navaids.
L2 If the entered navaid is neither a navigation database nor a pilot-stored navaid, the NEW NAVAID function is displayed (*Refer to NEW NAVAID Function*).

L1 **NO PILOT-STORED NAVAID IN THE PILOT-STORED ELEMENTS DATABASE**

If there is no pilot-stored navaid in the pilot-stored elements database, the PILOT STORED NAVAIDS panel displays the NO PILOT STORED NAVAID message.

NO PILOT STORED NAVAID Message



NO PILOT STORED NAVAID

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 NAVAID IDENT.

Ident.: DSC-22-FMS-20-20-20-100-00003848.0001001 / 22 APR 14

NAVAID NUMBER

Indicates the rank of the displayed pilot-stored navaid, and the total number of pilot-stored navaids.
The pilot-stored elements database has a maximum of 20 navaids.

Ident.: DSC-22-FMS-20-20-20-100-00003849.0001001 / 22 APR 14

NAVAID SCROLL BUTTONS

The flight crew uses the navaid scroll buttons to scroll, one by one, through the pilot-stored navaids.

Ident.: DSC-22-FMS-20-20-20-100-00003850.0002001 / 14 APR 16

NAVAID DATA [PILOT STORED NAVAIDS]

Indicates:

- The class

L2 The class can be one of the following:

NAVAID DATA ENTRY FIELDS

The flight crew enters:

- The class of the navaid, by using the CLASS list

L2 The class of the navaid can be one of the following:

- VOR
- DME
- VOR/DME
- LOC
- ILS
- GLS ◁
- NDB.

L1 - The latitude/longitude coordinates

- The elevation

L2 The ELEVATION entry field is not displayed for VOR and NDB.

L1 - The ident of the runway that is associated with the navaid

L2 The RWY IDENT entry field is displayed only for the landing systems.
If the entered runway ident is associated with neither a navigation database nor a pilot-stored airport, the PILOT STORED RWYs panel opens, and displays the NEW RWY function. For more information, *Refer to DSC-22-FMS-20-20-20 NEW RWY Function*.

L1 - The magnetic declination

L2 The STATION DEC entry field is displayed only for VOR and VOR/DME.
The T letter indicates that the navaid is defined in the true north reference.

L1 - The frequency or channel

- The approach category

L2 The category can be 1, 2 or 3.

L1 - The figure of merit that indicates the maximum tuning distance of the navaid

L2 The figure of merit can be one of the following:

- 0 (40 NM)
- 1 (70 NM)
- 2 (130 NM)
- 3 (250 NM).

L1 - The course.

L2 The CRS entry field is displayed only for the landing systems.
The T letter indicates that the course is defined in the true north reference.

L1 **ENTRY FORMAT**

For the entry format of:
- Latitude, *Refer to DSC-22-FMS-20-80 LAT*

Ident.: DSC-22-FMS-20-20-20-120-00003869.0001001 / 22 APR 14

FROM/TO ENTRY FIELDS

The flight crew enters the idents of the FROM/TO city-pair (i.e. departure airport and destination airport) in the entry fields.

L2 If the entered airport is neither a navigation database nor a pilot-stored airport, the FMS message area displays the NOT IN DATABASE message is displayed (*Refer to message*).

If the entered airport is a pilot-stored airport, the FMS message area displays the NOT ALLOWED DATABASE ARPTS ONLY (*Refer to message*).

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 AIRPORT (ARPT).

Ident.: DSC-22-FMS-20-20-20-120-00003870.0001001 / 22 APR 14

RTE IDENT LIST [DATABASE RTEs]

Indicates the company route ident.
The flight crew enters the company route ident via the keyboard, or by selecting the company route ident from the RTE IDENT list.
The RTE IDENT list displays all of the navigation database routes that are associated with the entered FROM/TO city-pair.

L2 If the entered route is neither a navigation database nor a pilot-stored route, the FMS message area displays the NOT IN DATABASE message (*Refer to message*).
If the entered route is a pilot-stored route, the PILOT STORED RTEs panel opens, and displays the associated data.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 CPNY RTE.

Ident.: DSC-22-FMS-20-20-20-120-00003871.0001001 / 14 APR 14

COMPANY ROUTE NUMBER [DATABASE RTEs]

Indicates the rank of the displayed company route, and the total number of navigation database company routes that are associated with the FROM/TO city-pair.

Ident.: DSC-22-FMS-20-20-20-120-00003872.0001001 / 14 APR 14

COMPANY ROUTE SCROLL BUTTONS [DATABASE RTEs]

The flight crew uses the company route scroll buttons to scroll, one by one, through the navigation database company routes that are associated with the FROM/TO city-pair.

Ident.: DSC-22-FMS-20-20-20-120-00003873.0001001 / 22 APR 14

ROUTE SUMMARY [DATABASE RTEs]

Indicates the route summary of the selected navigation-database company route.
The flight crew must read the summary from left to right, and from top to bottom.
Company route waypoints are displayed in large green font. Airways and procedures are displayed in small white font.

Note:
1. *A VIA or a direct flight leg is indicated by DIR.*
2. *A runway is indicated by RWY.*
3. *When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.*

Ident.: DSC-22-FMS-20-20-20-120-00003874.0001001 / 22 APR 14

ROUTE SUMMARY SCROLL BUTTONS [DATABASE RTEs]

The flight crew uses the route summary scroll down(up) button to move, page by page, downward(upward) through the route summary.

Ident.: DSC-22-FMS-20-20-20-120-00003876.0001001 / 22 APR 14

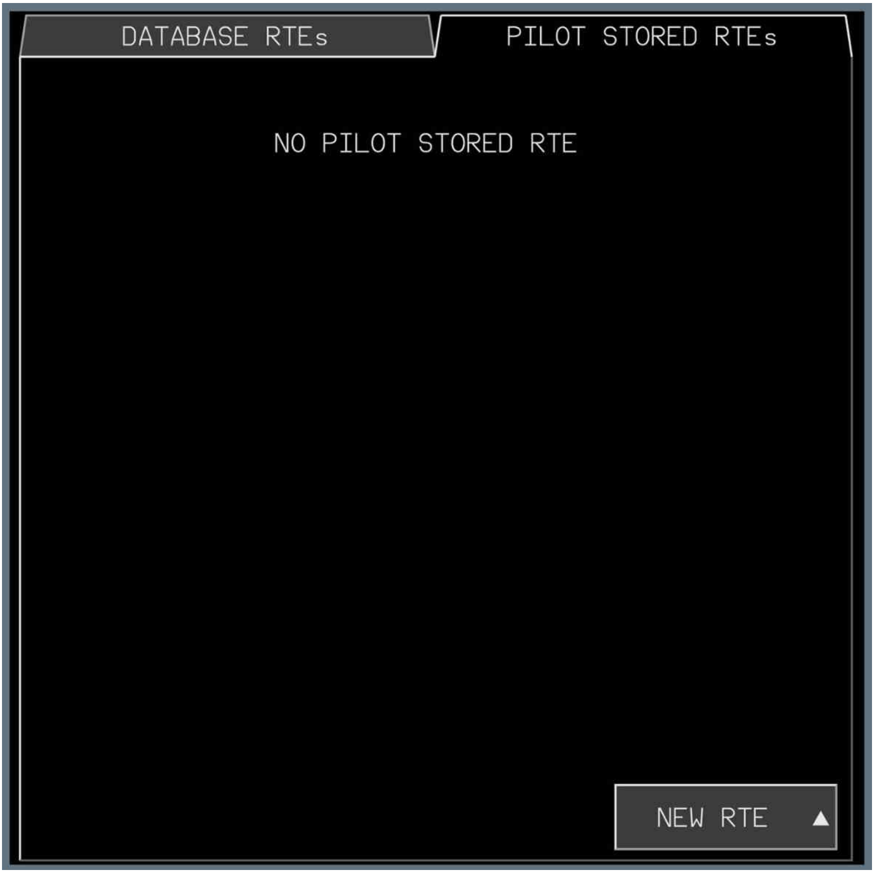
RTE IDENT LIST [PILOT STORED RTEs]

Indicates the ident of the displayed pilot-stored company route.
The flight crew enters the ident of the pilot-stored company route via the keyboard, or by selecting the ident of the pilot-stored company route from the RTE IDENT list.
The RTE IDENT list displays all of the pilot-stored company routes.

NO PILOT-STORED ROUTE IN THE PILOT-STORED ELEMENTS DATABASE

If there is no pilot-stored company route in the pilot-stored elements database, the PILOT STORED RTEs panel displays the NO PILOT STORED RTE message.

NO PILOT STORED RTE Message



NO PILOT STORED RTE

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 CPNY RTE.

Ident.: DSC-22-FMS-20-20-20-120-00003877.0001001 / 22 APR 14

FROM/TO [PILOT STORED RTEs]

Indicates the idents of the FROM/TO city-pair (i.e. departure airport and destination airport) that are associated with the displayed pilot-stored company route.

Ident.: DSC-22-FMS-20-20-20-120-00003878.0001001 / 14 APR 14

COMPANY ROUTE NUMBER [PILOT STORED RTEs]

Indicates the rank of the displayed pilot-stored company route, and the total number of pilot-stored company routes that are associated with the FROM/TO city-pair.
The pilot-stored elements database has a maximum of 5 company routes.

Ident.: DSC-22-FMS-20-20-20-120-00003879.0001001 / 14 APR 14

COMPANY ROUTE SCROLL BUTTONS [PILOT STORED RTEs]

The flight crew uses the company route scroll buttons to scroll, one by one, through the pilot-stored company routes that are associated with the FROM/TO city-pair.

Ident.: DSC-22-FMS-20-20-20-120-00003880.0001001 / 22 APR 14

ROUTE SUMMARY [PILOT STORED RTEs]

Indicates the route summary of the selected pilot-stored company route.
The flight crew must read the summary from left to right, and from top to bottom.
Company route waypoints are displayed in large green font. Airways and procedures are displayed in small white font.

Note: *1. A VIA or a direct flight leg is indicated by DIR.*
2. A runway is indicated by RWY.
3. When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.

Ident.: DSC-22-FMS-20-20-20-120-00003881.0001001 / 22 APR 14

ROUTE SUMMARY SCROLL BUTTONS [PILOT STORED RTEs]

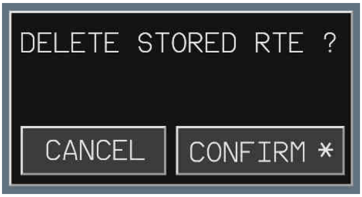
The flight crew uses the route summary scroll down(up) button to move, page by page, downward(upward) through the route summary.

Ident.: DSC-22-FMS-20-20-20-120-00003883.0001001 / 02 OCT 14

DELETE STORED RTE BUTTON

When clicked, deletes the pilot-stored company route that is currently displayed.
The flight crew must perform a confirmation action.

Confirmation Window



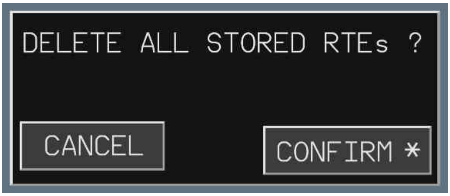
If the pilot-stored company route is still used by the FMS, it is not deleted. The FMS message area displays the F-PLN ELEMENT RETAINED message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-120-00003882.0001001 / 22 APR 14

DELETE ALL STORED RTES BUTTON

When clicked, deletes all pilot-stored company routes.
The flight crew must perform a confirmation action.

Confirmation Window



If there are pilot-stored company routes that are still used by the FMS, they are not deleted. The FMS message area displays the F-PLN ELEMENT RETAINED message (*Refer to message*).

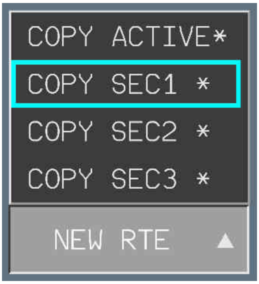
L2 The Operator can decide (via the AMI file) to automatically delete all pilot-stored elements, when the DONE flight phase becomes active.

Ident.: DSC-22-FMS-20-20-20-120-00003884.0001001 / 03 SEP 14

NEW RTE BUTTON

When clicked, opens the NEW RTE menu.

NEW RTE Menu



With the options of this menu, the flight crew can store a copy of the active or any secondary flight plan in the pilot-stored elements database.

L2 The flight crew can store a copy of the active flight plan only in the PREFLIGHT flight phase.
The copy of the active or any secondary flight plan does not include the LRC FMS speed mode, if selected.

L1 When the flight crew selects an option, the NEW RTE function appears on the PILOT STORED RTEs panel: The summary of the route that is associated with the copy of the flight plan is displayed, and this route can be stored in the pilot-stored elements database. For more information, *Refer to NEW RTE Function*.

Ident.: DSC-22-FMS-20-20-20-120-00003885.0001001 / 22 APR 14

Ident.: DSC-22-FMS-20-20-20-120-00003886.0001001 / 22 APR 14

RTE IDENT ENTRY FIELD

Indicates the ident of the new company route.

L2 If the entered route ident is already in the navigation database or in the pilot-stored elements database, the FMS message area displays the RTE IDENT ALREADY USED message (*Refer to message*).

L1

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 CPNY RTE.

Ident.: DSC-22-FMS-20-20-20-120-00003887.0001001 / 22 APR 14

FROM/TO [NEW RTE]

Indicates the idents of the FROM/TO city-pair (i.e. departure airport and destination airport) that are associated with the new pilot-stored company route.

Ident.: DSC-22-FMS-20-20-20-120-00003888.0001001 / 22 APR 14

ROUTE SUMMARY [NEW RTE]

Indicates the route summary of the flight plan copy.
The flight crew must read the summary from left to right, and from top to bottom.
Company route waypoints are displayed in large green font. Airways and procedures are displayed in small white font.

Note: *1. A VIA or a direct flight leg is indicated by DIR.*
2. A runway is indicated by RWY.
3. When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.

Ident.: DSC-22-FMS-20-20-20-120-00003889.0001001 / 22 APR 14

ROUTE SUMMARY SCROLL BUTTONS [NEW RTE]

The flight crew uses the route summary scroll down(up) button to move, page by page, downward(upward) through the route summary.

Ident.: DSC-22-FMS-20-20-20-120-00003890.0001001 / 22 APR 14

STORE RTE BUTTON

When clicked, stores the new company route in the pilot-stored elements database.
The pilot-stored routes database is limited to 5 company routes.
L2 If the pilot-stored elements database is full, the route creation is rejected, and the FMS message area displays the PILOT RTEs LIST FULL message (*Refer to message*).
Each stored company route has a maximum size of 30 flight plan elements. When the route is longer, only the first 30 elements are stored, and the FMS message area displays the SOME REVISIONS NOT STORED message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-120-00003891.0001001 / 14 APR 14

CANCEL BUTTON

When clicked, cancels the NEW RTE function.

Ident.: DSC-22-FMS-20-20-20-120-00003892.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the ACTIVE/INIT page (*Refer to page*).

L2 The RETURN button appears, only if the flight crew accesses the DATA/ROUTE page via the ACTIVE/INIT page.

DATA/STATUS PAGE

Applicable to: ALL

PURPOSE

On the ACFT STATUS panel of the STATUS page, the flight crew can:

- Check the aircraft type and the engine type
- Check the validity of the navigation database
- Change the navigation database
- Check the number of pilot-stored elements
- Delete the pilot-stored elements
- Change the FUEL PENALTY factor
- Change the PERF and IDLE factors.

L2

L1

On the FMS P/N panel of the STATUS page, the flight crew can display the part numbers of the FMS software, the FMC databases, and the configuration files.

ACCESS

The flight crew can access the STATUS page via:

- The general menu bar, by selecting STATUS in the DATA menu

L2 The ACFT STATUS panel of the STATUS page is automatically displayed:
- At FMS power-up
- After an automatic FMS reconfiguration, or FMC reset, before engine start
- When the DONE flight phase becomes active.

The FMS P/N panel of the STATUS page is automatically displayed, when:

- There is a power transient for more than 5 s, or
- The FMCs reset, because the part number of one FMC is not compatible with the part number of the other FMCs.

Ident.: DSC-22-FMS-20-20-20-130-00003895.0001001 / 14 APR 14

AIRCRAFT TYPE

Indicates the type of aircraft.

L2 The performance database contains the aircraft type.
For more information about the performance database, *Refer to DSC-22-FMS-10-20 Performance Database*.

Ident.: DSC-22-FMS-20-20-20-130-00003896.0001001 / 22 APR 14

ENGINE

Indicates the type of engine that the FMS uses to compute the aircraft performance.

L2 The performance database contains the engine type.
For more information about the performance database, *Refer to DSC-22-FMS-10-20 Performance Database*.

Ident.: DSC-22-FMS-20-20-20-130-00005205.0001001 / 25 AUG 14

FUEL PENALTY ENTRY FIELD

Indicates the FUEL PENALTY factor.
The FUEL PENALTY factor is a correction factor that the FMS uses to compute the aircraft performance and the flight plan predictions.
The FUEL PENALTY factor is a correction factor of the fuel flow.
The flight crew should consider the use of the FUEL PENALTY factor, if one or more system failures affect fuel consumption.

L2 The default value of the FUEL PENALTY factor is +000.0 %. The FUEL PENALTY entry field resets to this default value when the DONE flight phase becomes active.

L1 The flight crew can change the FUEL PENALTY factor at any time.

L2 For additional information, *Refer to FCTM/PR-AEP-FUEL Fuel Penalty*.

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 FUEL PENALTY (FACTOR).

Ident.: DSC-22-FMS-20-20-20-130-00003897.0001001 / 22 APR 14

IDLE AND PERF

Indicate the IDLE and PERF factors.

The IDLE factor and the PERF factor are correction factors that the FMS uses to compute the aircraft performance and the flight plan predictions.
The IDLE factor is a correction factor of the idle engine rating.
The PERF factor is a correction factor of the fuel flow.

The IDLE factor and the PERF factor are updated at the discretion of the Operator, as necessary:
- The Operator should define and apply the IDLE factor, if the computation of the path for the descent and the approach needs to be modified
- The Operator should define and apply the PERF factor, if there is any degradation in aerodynamic performance or engine performance.

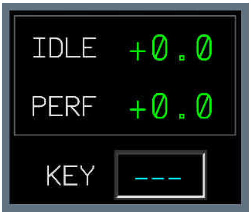
L2 The Operator can define a default value for both factors in the AMI file.
L1 The IDLE and PERF factors can be automatically changed via datalink with the company ground station. The flight crew can also manually change these factors via the MODIFY button (*Refer to MODIFY button*).

Ident.: DSC-22-FMS-20-20-20-130-00003898.0001001 / 22 APR 14

MODIFY BUTTON

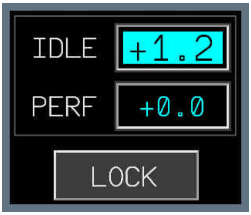
When clicked, removes the MODIFY button, and displays the KEY entry field. Then, the flight crew can enter the key code which is "ARM" by default.
L2 It is possible to modify the default code on airline request (the applicable code is then coded in the AMI file).

KEY Entry Field



IDLE +0.0
PERF +0.0
KEY ---

L1 After the flight crew enters the correct key code, the IDLE and PERF entry fields, and the LOCK button are displayed.



IDLE and PERF Entry Fields, and LOCK Button

The flight crew can now change the IDLE and PERF factors. The flight crew can lock the entered values. To lock the entered values, the flight crew clicks on the LOCK button.

ENTRY FORMAT

For the entry format of:
- the IDLE factor, *Refer to DSC-22-FMS-20-80 IDLE (FACTOR)*
- the PERF factor, *Refer to DSC-22-FMS-20-80 PERF (FACTOR)*.

Ident.: DSC-22-FMS-20-20-20-130-00003899.0001001 / 22 APR 14

NAV DATABASE

Indicates the part number of the active navigation database.

Ident.: DSC-22-FMS-20-20-20-130-00003900.0001001 / 14 APR 14

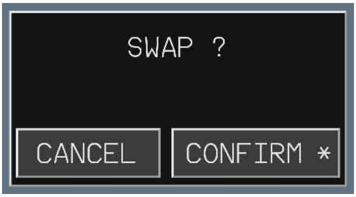
ACTIVE

Indicates the validity period of the active navigation database.

Ident.: DSC-22-FMS-20-20-20-130-00003901.0001001 / 22 APR 14

SWAP BUTTON

When clicked, the second navigation database becomes the active navigation database, and vice versa.
The flight crew must perform a confirmation action.



CONFIRM/CANCEL Window

CAUTION	The change of the databases erases the active and secondary flight plans, and the pilot-stored elements. The flight crew must never change databases in flight.

Ident.: DSC-22-FMS-20-20-20-130-00003902.0001001 / 22 APR 14

SECOND

Indicates the validity period of the second navigation database.

Ident.: DSC-22-FMS-20-20-20-130-00003903.0001001 / 22 APR 14

PILOT STORED ELEMENTS

Indicates the number of pilot-stored waypoints, routes, navaids, and runways.

L2 The Operator can decide (via the AMI file) to automatically delete all pilot-stored elements, when the DONE flight phase becomes active.

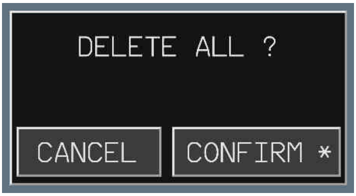
L1 All pilot-stored elements are automatically deleted, when one of the following occurs:
- A new navigation database is loaded
- The active navigation database becomes the second navigation database, and vice versa.

Ident.: DSC-22-FMS-20-20-20-130-00003904.0001001 / 22 APR 14

DELETE ALL BUTTON

When clicked, deletes all pilot stored waypoints, routes, navaids, and runways.
The flight crew must perform a confirmation action.

Confirmation Window



DELETE ALL ?

If there are pilot-stored elements that are still used by the FMS, they are not deleted. The FMS message displays the F-PLN ELEMENT RETAINED message (*Refer to DSC-22-FMS-20-90 F-PLN ELEMENT RETAINED*).

L2 The Operator can decide (via the AMI file) to automatically delete all pilot-stored elements, when the DONE flight phase becomes active.

Ident.: DSC-22-FMS-20-20-20-130-00003905.0001001 / 01 SEP 16

ELEMENT LIST

The flight crew selects from the list the database element for which they want to display the part numbers.

The ELEMENT list has the following options:

- FMS SOFTWARE: Displays the part number of the FMS software for each FMC
- NAV DATABASE: Displays the part number of the navigation database for each FMC

L2 For information about the navigation database, *Refer to DSC-22-FMS-10-20 Navigation Database*.

L1
- FMS AIRLINE CONFIG: Displays the part number of the AMI file for each FMC

L3 For more information about the AMI file, *Refer to DSC-22-FMS-10-20 Airline Modifiable Information (AMI) File*.

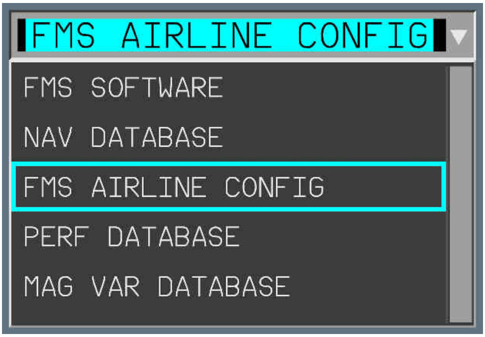
L1
- PERF DATABASE: Displays the part number of the performance database for each FMC

L2 For more information about the performance database, *Refer to DSC-22-FMS-10-20 Performance Database*.

L1
- MAG VAR DATABASE: Displays the part number of the magnetic variation database for each FMC.

L2 For more information about the magnetic variation database, *Refer to DSC-22-FMS-10-20 Magnetic Variation Database*.

ELEMENT List



FMS AIRLINE CONFIG
FMS SOFTWARE
NAV DATABASE
FMS AIRLINE CONFIG
PERF DATABASE
MAG VAR DATABASE

L1 The part numbers appear below the ELEMENT list (*Refer to Database Element Part Numbers*).

Ident.: DSC-22-FMS-20-20-20-130-00005203.0001001 / 22 APR 14

DATABASE ELEMENT NUMBER

Indicates the rank of the selected database element, and the total number of the database elements of the ELEMENT list.

Ident.: DSC-22-FMS-20-20-20-130-00003906.0001001 / 22 APR 14

DATABASE ELEMENT SCROLL BUTTONS

The flight crew uses the database element scroll buttons to scroll, one by one, through the database elements of the ELEMENT list. The associated part numbers are displayed accordingly.

Note: *The wheel of the KCCU has the same function as the scroll buttons: Scrolling down(up) the wheel displays the next(previous) database element and its associated part numbers.*

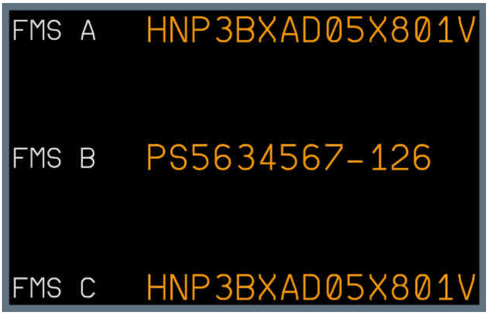
Ident.: DSC-22-FMS-20-20-20-130-00003907.0001001 / 22 APR 14

FMS A, FMS B, AND FMS C

Indicate, for each FMC (FMC-A, FMC-B, and FMC-C), the part number of the database element that is selected in the ELEMENT list.

L2 The part numbers are all displayed in amber, if there are at least two different numbers for a same database.

Different Part Numbers



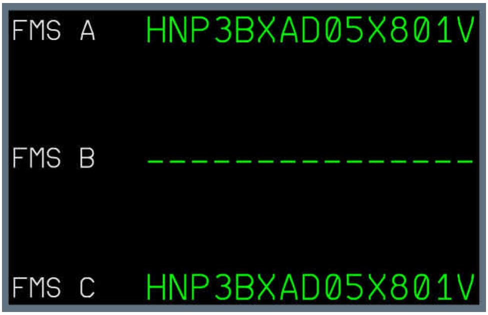
FMS A HNP3BXAD05X801V

FMS B PS5634567-126

FMS C HNP3BXAD05X801V

If an FMC is not available or not connected to the FMC that controls the MFD on which the DATA/STATUS page is displayed, dashes appear instead of the associated part number.

Part Number Not Available



FMS A HNP3BXAD05X801V

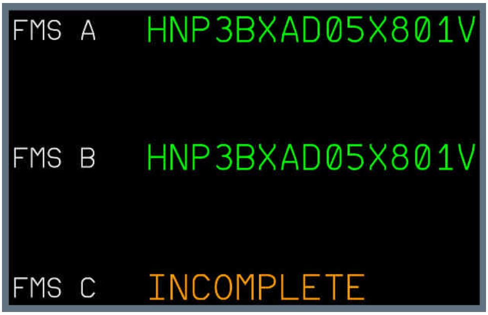
FMS B ----------------

FMS C HNP3BXAD05X801V

The following database elements are mandatory: FMS SOFTWARE, NAV DATABASE, FMS OPTIONS CONFIG, PERF DATABASE, and MAG VAR DATABASE. They must be loaded in the FMCs.

If there is no part number for a mandatory database, INCOMPLETE appears instead of the part number.

INCOMPLETE



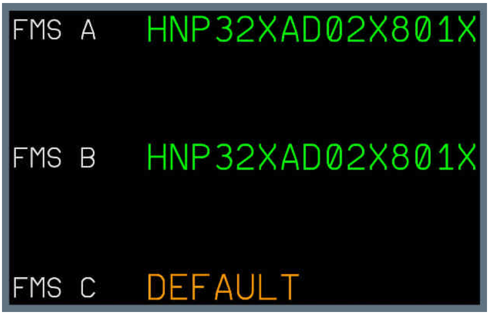
FMS A HNP3BXAD05X801V

FMS B HNP3BXAD05X801V

FMS C INCOMPLETE

FMS AIRLINE CONFIG is not a mandatory database element. If there is no part number for this database element, DEFAULT appears instead of the part number.

DEFAULT



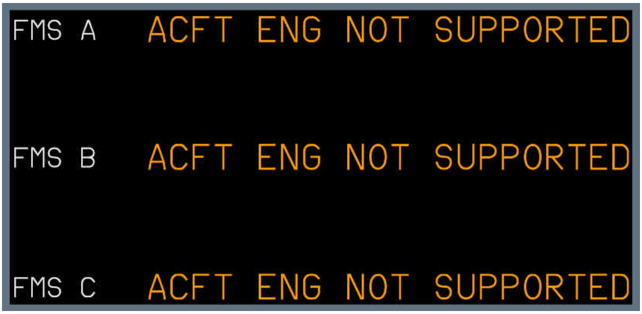
FMS A HNP32XAD02X801X

FMS B HNP32XAD02X801X

FMS C DEFAULT

If the flight crew selects PERF DATABASE in the ELEMENT list, and there is no performance model that is associated with the applicable aircraft and engine type, ACFT ENGINE NOT SUPPORTED appears instead of the part number.

ACFT ENG NOT SUPPORTED



FMS A ACFT ENG NOT SUPPORTED

FMS B ACFT ENG NOT SUPPORTED

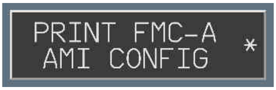
FMS C ACFT ENG NOT SUPPORTED

Ident.: DSC-22-FMS-20-20-20-130-00003908.0001001 / 01 SEP 16

PRINT FMC-A(B)(C) AMI CONFIG BUTTON

If the flight crew selects FMS AIRLINE CONFIG from the ELEMENT list, they can use the PRINT FMC-A(B)(C) AMI CONFIG button to print the content of the AMI file of the FMC that controls the MFD on which the DATA/STATUS page is displayed.

PRINT FMC-A(B)(C) AMI CONFIG Button



In this case, the button label:
- PRINT FMC-A AMI CONFIG, if the FMC-A controls the MFD on which the DATA/STATUS page is displayed
- PRINT FMC-B AMI CONFIG, if the FMC-B controls the MFD on which the DATA/STATUS page is displayed
- PRINT FMC-C AMI CONFIG, if the FMC-C controls the MFD on which the DATA/STATUS page is displayed.

Ident.: DSC-22-FMS-20-20-20-130-00003909.0001001 / 22 APR 14

PRINT ALL P/N BUTTON

When clicked, prints the FM P/N STATUS report.

Ident.: DSC-22-FMS-20-20-20-130-00003910.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the ACTIVE/INIT page (*Refer to page*).

L2 The RETURN button appears, only if the flight crew accesses the DATA/STATUS page via the ACTIVE/INIT page.

DATA/WAYPOINT PAGE

WPT IDENT ENTRY FIELD [DATABASE WPTs]

The flight crew enters the ident of a waypoint(navaid)(runway)(airport) in the entry field.
L2 If the entered ident is the ident of a pilot-stored waypoint(navaid)(runway)(airport), the PILOT STORED WPTs panel opens, and displays the associated data.
If the entered ident is the ident of neither a navigation database nor a pilot-stored waypoint(navaid)(runway)(airport), the PILOT STORED WPTs panel opens, and displays the NEW WPT function (*Refer to NEW WPT Function*).

L1 ENTRY FORMAT

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Navaid, *Refer to DSC-22-FMS-20-80 NAVAID IDENT*
- Airport, *Refer to DSC-22-FMS-20-80 AIRPORT (ARPT)*
- Runway, *Refer to DSC-22-FMS-20-80 RWY IDENT*.

Ident.: DSC-22-FMS-20-20-20-140-00003915.0001001 / 22 APR 14

LAT/LONG

Indicates the latitude and longitude coordinates of the navigation database waypoint(navaid)(runway)(airport).

Ident.: DSC-22-FMS-20-20-20-140-00003917.0001001 / 22 APR 14

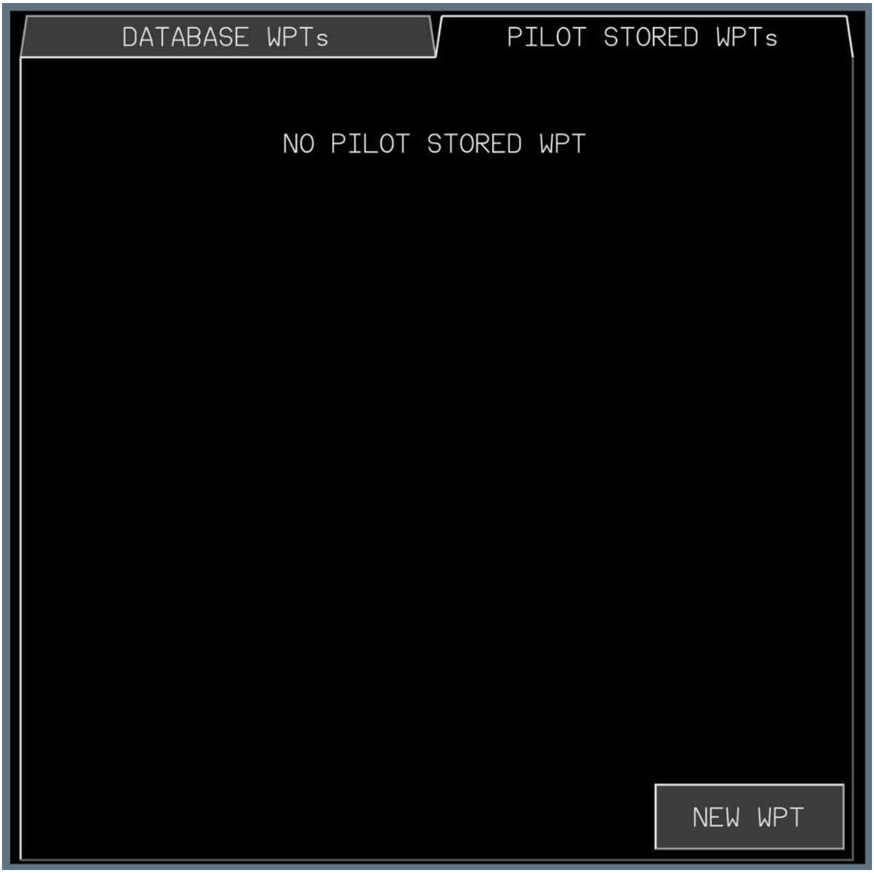
WPT IDENT LIST

Indicates the ident of the displayed pilot-stored waypoint.
The flight crew enters the ident of the pilot-stored waypoint via the keyboard, or by selecting the ident of the pilot-stored waypoint from the WPT IDENT list.
The WPT IDENT list displays all of the pilot-stored waypoints.
L2 If the entered waypoint is neither a navigation database nor a pilot-stored waypoint, the PILOT STORED WPTs panel opens, and displays the NEW WPT function (*Refer to NEW WPT Function*).

L1 NO PILOT-STORED WAYPOINT IN THE PILOT-STORED ELEMENTS DATABASE

If there is no pilot-stored waypoint in the pilot-stored elements database, the PILOT STORED WPTs panel displays the NO PILOT STORED WPT message.

NO PILOT STORED WPT Message



NO PILOT STORED WPT

ENTRY FORMAT

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Navaid, *Refer to DSC-22-FMS-20-80 NAVAID IDENT*
- Airport, *Refer to DSC-22-FMS-20-80 AIRPORT (ARPT)*
- Runway, *Refer to DSC-22-FMS-20-80 RWY IDENT*.

Ident.: DSC-22-FMS-20-20-20-140-00003918.0001001 / 22 APR 14

WAYPOINT SCROLL BUTTONS

The flight crew uses the waypoint scroll buttons to scroll, one by one, through the pilot-stored waypoints.

Ident.: DSC-22-FMS-20-20-20-140-00003919.0001001 / 22 APR 14

WAYPOINT NUMBER

Indicates the rank of the displayed pilot-stored waypoint, and the total number of pilot-stored waypoints.
The pilot-stored waypoints database has a maximum of 99 waypoints.

WAYPOINT POSITION DATA

Indicates the position data of the pilot-stored waypoint:

- Place/distance waypoint:

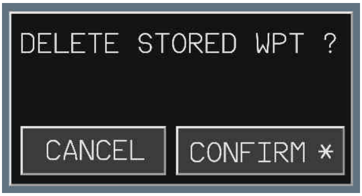
DELETE STORED WPT BUTTON

When clicked, deletes the pilot-stored waypoint that is currently displayed.
The flight crew must perform a confirmation action.

Confirmation Window



DELETE STORED WPT ?

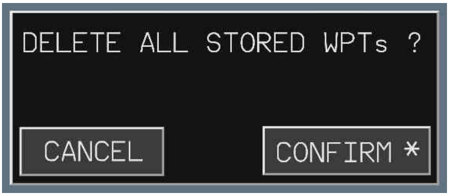
If the pilot-stored waypoint is still used by the FMS, it is not deleted. The FMS message area displays the F-PLN ELEMENT RETAINED message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-140-00003922.0001001 / 22 APR 14

DELETE ALL STORED WPTs BUTTON

When clicked, deletes all pilot-stored waypoints.
The flight crew must perform a confirmation action.

Confirmation Window



DELETE ALL STORED WPTs ?

If there are pilot-stored waypoints that are still used by the FMS, they are not deleted. The FMS message area displays the F-PLN ELEMENT RETAINED message (*Refer to message*).

L2 The Operator can decide (via the AMI file) to automatically delete all pilot-stored elements, when the DONE flight phase becomes active.

Ident.: DSC-22-FMS-20-20-20-140-00003923.0001001 / 22 APR 14

NEW WPT BUTTON

When clicked, displays the NEW WPT function on the PILOT STORED WPTs panel (*Refer to NEW WPT Function*).

Ident.: DSC-22-FMS-20-20-20-140-00003926.0001001 / 22 APR 14

WAYPOINT POSITION ENTRY FIELDS

The flight crew can create a waypoint by entering either:
- A latitude and longitude, or
- A place/bearing/distance, or
- A place-bearing/place-bearing.

ENTRY FORMAT

For the entry format of:
- Latitude, *Refer to DSC-22-FMS-20-80 LAT*
- Longitude, *Refer to DSC-22-FMS-20-80 LONG*
- Place, *Refer to DSC-22-FMS-20-80 PLACE*
- Bearing, *Refer to DSC-22-FMS-20-80 BRG*
- Distance, *Refer to DSC-22-FMS-20-80 DIST*.

Ident.: DSC-22-FMS-20-20-20-140-00003927.0001001 / 22 APR 14

STORE WPT BUTTON

When clicked, stores the new waypoint in the pilot-stored elements database.
The pilot-stored elements database is limited to 99 waypoints.

L2 If the pilot-stored waypoints database is full, the first-created waypoint that is not part of the flight plan is deleted. If the FMS uses all of the 99 waypoints, the waypoint creation is rejected, and the FMS message area displays the 99 WPTs MAX : ALL IN USE message is displayed (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-140-00003928.0001001 / 14 APR 14

CANCEL BUTTON

When clicked, cancels the NEW WPT function.

This area displays the selected departure procedure parameters.

L2 The information appears in green, if the departure information is part of the active flight plan. It appears in yellow, if the flight crew created a temporary flight plan, by selecting or changing the departure procedure.

Note: *If there is a temporary flight plan that was created by a revision other than the DEPARTURE revision, the information is displayed in green.*

The information is displayed in white for the secondary flight plans.

L1 All fields, except FROM, display dashes, if the flight crew did not make any selection.

FROM

Indicates the ident of the:
- Departure airport, if the flight crew displays the DEPARTURE page for the destination flight plan
- Destination airport, if the flight crew displays the DEPARTURE page for the alternate flight plan.

LANDING SYSTEM

Indicates the type and ident of the landing system of the selected departure runway.

RWY

Indicates the selected departure runway.

LENGTH

Indicates the navigation database runway length of the selected departure runway.

CRS

Indicates the navigation database runway course of the selected departure runway.

EOSID

Indicates the EOSID that is associated with the selected departure runway.
NONE is displayed, if there is no EOSID in the navigation database for the selected departure runway.

FREQ/CHAN

Indicates the frequency or channel of the landing system of the selected departure runway.

SID

Indicates the SID that the flight crew selected from the SID list (*Refer to SID Button*).

TRANS

Indicates the departure TRANS that the flight crew selected from the TRANS list (*Refer to TRANS Button*).

Ident.: DSC-22-FMS-20-20-20-150-00003932.0001001 / 22 APR 14

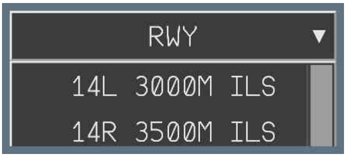
RWY BUTTON

When clicked, displays the RWY list.

The RWY list displays all of the runways that are compatible with the:
- Departure airport, if the flight crew displays the DEPARTURE page for the destination flight plan
- Destination airport, if the flight crew displays the DEPARTURE page for the alternate flight plan.

For each runway, the RWY list displays:
- The length of the runway
- The landing system that is associated with the runway.

RWY List



RWY ▼

14L 3000M ILS

14R 3500M ILS

When the flight crew selects a runway, the FMS creates(updates) a temporary flight plan, and completes(updates) the following fields in the SELECTED DEPARTURE area:
- RWY
- LENGTH
- CRS
- EOSID
- Landing system
- FREQ/CHAN.

Ident.: DSC-22-FMS-20-20-20-150-00003933.0001001 / 22 APR 14

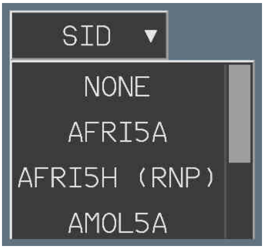
SID BUTTON

When clicked, displays the SID list.

L2 *Note: The flight crew can display the SID list, only if a departure runway is selected.*

L1 The SID list displays all of the SIDs that are compatible with the selected departure runway.
The first option of the SID list is NONE.
If a SID is part of an RNP AR procedure, the (RNP) label appears next to the SID ident.

SID List



SID ▼

NONE

AFRI5A

AFRI5H (RNP)

AMOL5A

L2 *Note: The NONE option is automatically selected, when the flight crew selects a departure runway and there is no compatible SID.*
When the flight crew selects NONE, or when there is no compatible SID, a default leg, up to 1 500 ft on the runway axis, is created.

L1 When the flight crew selects a SID or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the SID field in the SELECTED DEPARTURE area.

Ident.: DSC-22-FMS-20-20-20-150-00003934.0001001 / 22 APR 14

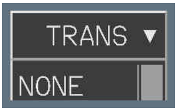
TRANS BUTTON

When clicked, displays the TRANS list.

L2 *Note: The flight crew can display the TRANS list, only if a departure runway and a SID are selected.*

L1 The TRANS list displays all of the TRANS that are compatible with the selected departure runway and SID.
The first option in the TRANS list is NONE.
If a TRANS is part of an RNP AR procedure, the (RNP) label appears next to the TRANS ident.

TRANS List



L2 *Note: The NONE option is automatically selected, when all of the following occur:*
- *The flight crew selects a departure runway and a SID*
- *There is no compatible TRANS.*

L1 When the flight crew selects a TRANS or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the TRANS field in the SELECTED DEPARTURE area.

Ident.: DSC-22-FMS-20-20-20-150-00003935.0001001 / 22 APR 14

TMPY F-PLN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).

L2 The TMPY F-PLN button is displayed, only if there is a temporary flight plan. If there is no temporary flight plan, the RETURN button is displayed instead of the TMPY F-PLN button. When the flight crew clicks on the RETURN button, the F-PLN page appears.

F-PLN INFO
MSG LIST

L2 The flight crew cannot access the DIRECT TO page, when:

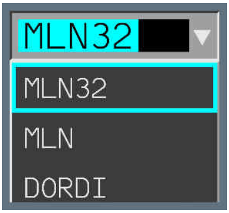
- A temporary flight plan that is not created by a DIR TO is on standby
  The FMS message area displays the INSERT OR ERASE TMPY F-PLN FIRST message (*Refer to message*).
- The aircraft position is not valid.
  The FMS message area displays the ACFT POSITION NOT VALID message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-160-00003938.0001001 / 22 APR 14

DIRECT TO LIST

Indicates the target waypoint of the DIR TO.
The flight crew enters the target waypoint via the keyboard, or by selecting the target waypoint from the DIRECT TO list.
The DIRECT TO list displays all of the flight plan waypoints between the FROM waypoint and the destination airport.

DIRECT TO List



The target waypoint can be one of the following:
- A waypoint, navaid, airport, or runway of the navigation database or pilot-stored elements database
- A latitude/longitude waypoint
- A place/bearing/distance waypoint
- A place-bearing/place-bearing waypoint.

If the flight crew inserts a target waypoint that is a latitude/longitude, place/bearing/distance, or place-bearing/place-bearing waypoint, the FMS stores this waypoint in the pilot-stored elements database.

L2 For more information about the pilot-stored elements database, *Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database*.

L1 The revised waypoint is automatically selected as the target waypoint, if the flight crew accesses the DIRECT TO page via the waypoint revisions menu.

ENTRY FORMAT

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Navaid, *Refer to DSC-22-FMS-20-80 NAVAID IDENT*
- Airport, *Refer to DSC-22-FMS-20-80 AIRPORT (ARPT)*
- Runway, *Refer to DSC-22-FMS-20-80 RWY IDENT*
- Latitude/longitude waypoint, *Refer to DSC-22-FMS-20-80 LAT/LONG*

- Place/bearing/distance waypoint, *Refer to DSC-22-FMS-20-80 PLACE/BEARING/DISTANCE (PBD)*
- Place-bearing/place-bearing waypoint, *Refer to DSC-22-FMS-20-80 PLACE-BEARING/PLACE-BEARING (PB/PB)*.

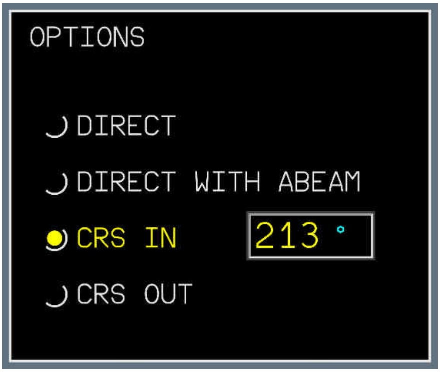
Ident.: DSC-22-FMS-20-20-20-160-00003939.0001001 / 22 APR 14

OPTIONS OPTION LIST

The flight crew selects the desired option of the DIR TO, by selecting one of the following options:
- DIRECT
- DIRECT WITH ABEAM

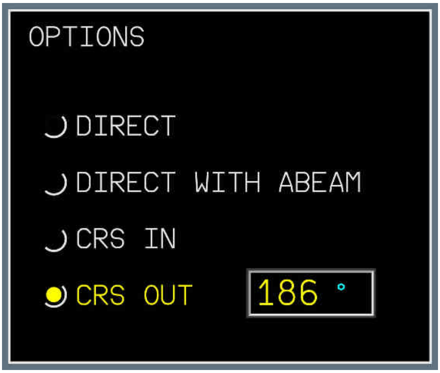
- CRS IN
  When selected, displays the CRS IN entry field. The flight crew enters the inbound course in the CRS IN entry field.
  If the target waypoint of the DIR TO is a flight plan waypoint, the CRS IN entry field displays a default value for the inbound course. The default value is the course from the flight plan waypoint that is before the target waypoint to the target waypoint.
  The flight crew can overwrite the default value.
  If the flight crew clears the manually-entered value, the default value reappears.

CRS IN Entry Field



- CRS OUT.
  When selected, displays the CRS OUT entry field. The flight crew enters the outbound course in the CRS OUT entry field.
  If the target waypoint of the DIR TO is a flight plan waypoint, the CRS OUT entry field displays a default value for the outbound course. The default value is the course from the target waypoint to the flight plan waypoint that is after the target waypoint.
  The flight crew can overwrite the default value.
  If the flight crew clears the manually-entered value, the default value reappears.

CRS OUT Entry Field



L2 The default-selected option of the OPTIONS option list is DIRECT or DIRECT WITH ABEAM, depending on the selection of the Operator via the AMI file.

L3 For information about the AMI file, *Refer to DSC-22-FMS-10-20 Airline Modifiable Information (AMI) File*.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 CRS IN(OUT).

Ident.: DSC-22-FMS-20-20-20-160-00003940.0001001 / 22 APR 14

TARGET WAYPOINT INFORMATION

Indicates:
- The Estimated Time of Arrival (ETA), in UTC time, at the target waypoint
- The distance between the current position of the aircraft and the target waypoint.

Ident.: DSC-22-FMS-20-20-20-160-00003941.0001001 / 22 APR 14

INSERT DIR TO BUTTON

When clicked, inserts the temporary flight plan, and displays the ACTIVE/F-PLN page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-160-00003942.0001001 / 22 APR 14

ERASE DIR TO BUTTON

When clicked, deletes the temporary flight plan, and displays the ACTIVE/F-PLN page (*Refer to page*).

DUPLICATE NAMES PAGE

Applicable to: ALL

Ident.: DSC-22-FMS-20-20-20-170-00002716.0001001 / 22 APR 14

RETURN
RETURN Button
Scroll Buttons

Ident.: DSC-22-FMS-20-20-20-170-00005612.0001001 / 22 APR 14

PURPOSE

On the DUPLICATE NAMES page, the flight crew can select the desired database element (waypoint, airport, runway, or navaid), when elements of the navigation and pilot-stored elements databases have the same ident.

Ident.: DSC-22-FMS-20-20-20-170-00003943.0001001 / 14 APR 14

ACCESS

The DUPLICATE NAMES page automatically appears, when all of the following occur:
- The flight crew enters the ident of a database element in an entry field of an FMS page
- Two or more database elements have the same ident.

Ident.: DSC-22-FMS-20-20-20-170-00003944.0001001 / 22 APR 14

DATABASE ELEMENT LIST

Indicates all of the database elements that have the same ident.

For each database element, indicates:
- The ident
- The direct distance from the aircraft
- The latitude and longitude
- The frequency, if the database element is a navaid.

The rank of a database element in the list depends on the direct distance from the present position to the database element: The first-listed database element is the nearest.

Ident.: DSC-22-FMS-20-20-20-170-00003945.0001001 / 22 APR 14

SCROLL BUTTONS

The flight crew uses the scroll down(up) button to move, page by page, downward(upward) through the database element list.

Ident.: DSC-22-FMS-20-20-20-170-00003946.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the page that was displayed before the DUPLICATE NAMES page.

ETP

Ident.: DSC-22-FMS-20-20-20-180-00003947.0001001 / 22 APR 14

PURPOSE

On the EQUI-TIME POINT page, the flight crew enters the necessary data that the FMS uses to compute the Equi-Time Point (ETP) between two reference points. The ETP is the pseudo waypoint of the flight plan from which the time to reach the first reference point (REF 1) is the same as the time to reach the second reference point (REF 2).

By default, the FMS computes the ETP between the departure airport (REF1) and the destination airport (REF2).
The EQUI-TIME POINT page displays the results of the ETP computation.

L2 *Note:* *To compute the ETP, the FMS takes into account the FMS speed mode (ECON/LRC), the speed/Mach control, and the entered wind at the reference points.*

L1 The EQUI-TIME POINT page is available for the active flight plan only.

LINKS

For information about the ETP function, *Refer to DSC-22-FMS-10-40-40 Equi-Time Point (ETP) Function*.

Ident.: DSC-22-FMS-20-20-20-180-00003948.0001001 / 14 APR 14

ACCESS

The flight crew can access the EQUI-TIME POINT page via the ACTIVE/F-PLN page, by selecting EQUI-TIME POINT in the F-PLN INFO menu.

DATA FROM P.POS TO REF1(2)

Indicates:

- The bearing between the aircraft present position and REF1(2)
  L2 The T letter indicates that the bearing is defined in the true north reference.
- L1 The direct distance between the aircraft present position and REF1(2)
- The Estimated Time of Arrival (ETA), in UTC(flight) time, at REF1(2).
  The computation of the ETA is based on a direct trajectory from the aircraft present position to REF1(2).

  The UTC(TIME) label indicates the time reference:
  - The UTC label indicates that the time reference is the UTC time
  - The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:
  - In the PREFLIGHT flight phase:
    - ■ If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
    - ■ If there is no entered ETT, the time reference is the flight time

    The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
  - In flight:
    - ■ If the UTC time is valid, the time reference is the UTC time
    - ■ If the UTC time is not valid, the time reference is the flight time.

Ident.: DSC-22-FMS-20-20-20-180-00003950.0001001 / 22 APR 14

REF1(2) ENTRY FIELD

Indicates the ident of the reference point.
The reference point can be a waypoint, an airport, a navaid, or a runway.
The default REF1 is the departure airport. The default REF2 is the destination airport. The flight crew can overwrite the default value at any time.
L2 If the entered REF1(2) ident is already selected in the REF2(1) entry field, the FMS message area displays the NOT ALLOWED message (*Refer to message*).

L1 ENTRY FORMAT

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Navaid, *Refer to DSC-22-FMS-20-80 NAVAID IDENT*
- Airport, *Refer to DSC-22-FMS-20-80 AIRPORT (ARPT)*
- Runway, *Refer to DSC-22-FMS-20-80 RWY IDENT*.

Ident.: DSC-22-FMS-20-20-20-180-00003951.0001001 / 14 APR 14

CRZ FL WIND ENTRY FIELDS

The flight crew enters the wind direction and wind speed for the cruise flight level at the reference point.

ENTRY FIELD

For the entry format of:

- Wind direction, *Refer to DSC-22-FMS-20-80 WIND DIRECTION*
- Wind speed, *Refer to DSC-22-FMS-20-80 WIND SPEED*.

Ident.: DSC-22-FMS-20-20-20-180-00003952.0001001 / 14 APR 14

DATA FROM ETP TO REF1(2)

Indicates:

- The track from the ETP to REF1(2)
  L2 The T letter indicates that the track is defined in the true north reference.
- L1 The direct distance between the ETP and REF1(2)
- The Estimated Time of Arrival (ETA), in UTC(flight) time, at REF1(2).
  The computation of the ETA is based on an overfly of the ETP, and a direct trajectory from the ETP to REF1(2).

  The UTC(TIME) label indicates the time reference:
  - The UTC label indicates that the time reference is the UTC time
  - The TIME label indicates that the time reference is the flight time.

  L2 The time reference is defined as follows:
  - In the PREFLIGHT flight phase:
    - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
    - If there is no entered ETT, the time reference is the flight time

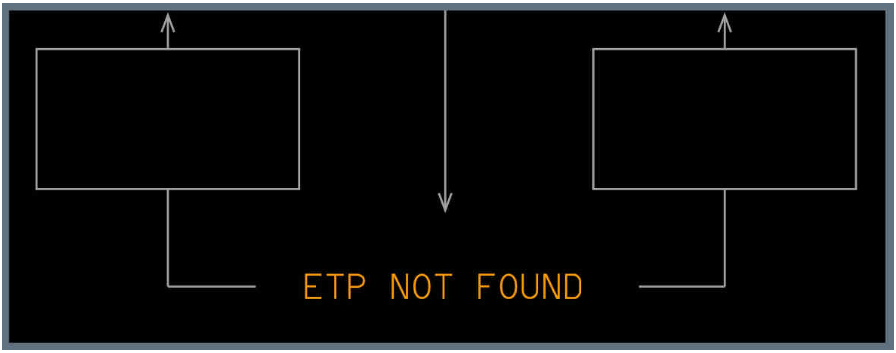
    The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
  - In flight:
    - If the UTC time is valid, the time reference is the UTC time
    - If the UTC time is not valid, the time reference is the flight time.

Ident.: DSC-22-FMS-20-20-20-180-00003953.0001001 / 22 APR 14

ETP

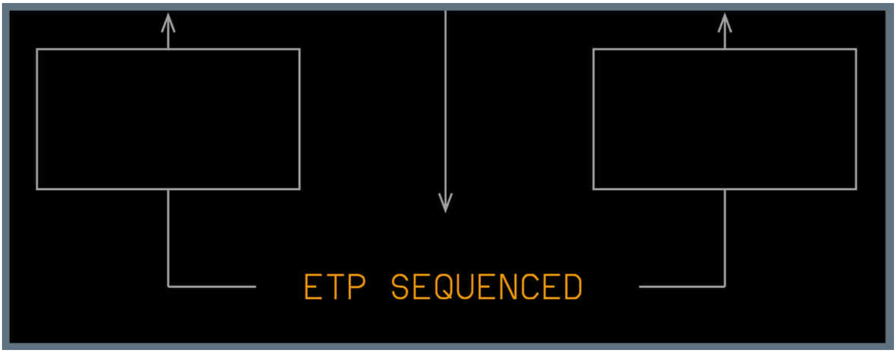
Indicates the equi-time point.
The ETP is a place/distance waypoint. The place reference is the waypoint that follows the ETP.
If the FMS cannot compute any ETP, the ETP NOT FOUND label appears instead of the ETP.

ETP NOT FOUND Label



When the ETP is sequenced, the ETP SEQUENCED label appears instead of the ETP.

ETP SEQUENCED Label



Ident.: DSC-22-FMS-20-20-20-180-00003954.0001001 / 14 APR 14

DATA FROM P.POS TO ETP

Indicates:
- The distance along the flight plan between the aircraft present position and the ETP
- The Estimated Time of Arrival (ETA), in UTC(flight) time, at the ETP.
  The computation of the ETA is based on a trajectory along the flight plan from the aircraft present position to the ETP.

  The UTC(TIME) label indicates the time reference:
  - The UTC label indicates that the time reference is the UTC time
  - The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:
- In the PREFLIGHT flight phase:
  - ■ If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - ■ If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - ■ If the UTC time is valid, the time reference is the UTC time
  - ■ If the UTC time is not valid, the time reference is the flight time.

PURPOSE

On the FIX1(2)(3)(4) panel of the FIX INFO page, the flight crew can:

- Define a reference fix for display on the ND
- For this reference fix:
  - Define two radials from the reference fix
    The ND displays these radials.
  - Define a circle with the reference fix as center
    The ND displays this circle.
  - Compute the abeam line from the reference fix on the flight plan
    The ND displays this abeam line.
- Insert in the flight plan the intersection points between the flight plan and the:
  - Defined radial(s)
  - Defined circle
  - Computed abeam line.

The FIX INFO page is available for the active flight plan only.

LINKS

For information about the FIX INFO revision, *Refer to DSC-22-FMS-10-40-20 Purpose*

REF IDENT ENTRY FIELD

The flight crew enters the reference fix ident in the entry field.

The reference fix ident can be one of the following elements of the navigation database or pilot-stored elements database:

- Waypoint
- Navaid

- Airport
- Runway.

L2 For more information about:
- The navigation database, *Refer to DSC-22-FMS-10-20 Navigation Database*
- The pilot-stored elements database, *Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database*.

L1 ENTRY FORMAT

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Navaid,*Refer to DSC-22-FMS-20-80 NAVAID IDENT*
- Airport, *Refer to DSC-22-FMS-20-80 AIRPORT (ARPT)*
- Runway, *Refer to DSC-22-FMS-20-80 RWY*.

Ident.: DSC-22-FMS-20-20-20-190-00003959.0001001 / 22 APR 14

UTC(TIME) LABEL

Indicates the time reference:
- The UTC label indicates that the time reference is the UTC time
- The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:
- In the PREFLIGHT flight phase:
  - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - If the UTC time is valid, the time reference is the UTC time
  - If the UTC time is not valid, the time reference is the flight time.

Ident.: DSC-22-FMS-20-20-20-190-00003960.0001001 / 22 APR 14

RADIAL ENTRY FIELD

The flight crew enters a radial of the reference fix in the entry field.

After the flight crew enters a radial:
- The data that is related to the intersection point between the radial and the flight plan appears on the line next to the RADIUS entry field (*Refer to F-PLN INTERCEPT Data*)
  If there is no intersection point, dashes are displayed.
- The INSERT AS WPT button appears next to the F-PLN INTERCEPT data (*Refer to INSERT AS WPT Button*).

Note: When the intersection is inserted as a waypoint in the active flight plan, the radial and intersection data are no longer displayed on the page.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 RADIAL.

Ident.: DSC-22-FMS-20-20-20-190-00003961.0001001 / 22 APR 14

F-PLN INTERCEPT DATA

This line indicates for each computed intersection point:
- The ETA, in UTC(flight) time, at the intersection point
- The estimated distance along the flight plan between the aircraft present position and the intersection point
- The estimated flight level at the intersection point.

Ident.: DSC-22-FMS-20-20-20-190-00003962.0001001 / 22 APR 14

INSERT AS WPT BUTTON

When clicked, inserts in the flight plan a waypoint at the intersection between the defined radial, radius, or abeam line, and the flight plan.

Ident.: DSC-22-FMS-20-20-20-190-00003963.0001001 / 22 APR 14

RADIUS ENTRY FIELD

The flight crew enters a circle radius from the reference fix in the entry field.

After the flight crew enters a circle radius:
- The data that is related to the intersection point between the circle and the flight plan appears on the line next to the RADIUS entry field (*Refer to F-PLN INTERCEPT Data*)
  If there is no intersection point, dashes are displayed.
- The INSERT AS WPT button appears next to the F-PLN INTERCEPT data (*Refer to INSERT AS WPT Button*).

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 RADIUS.

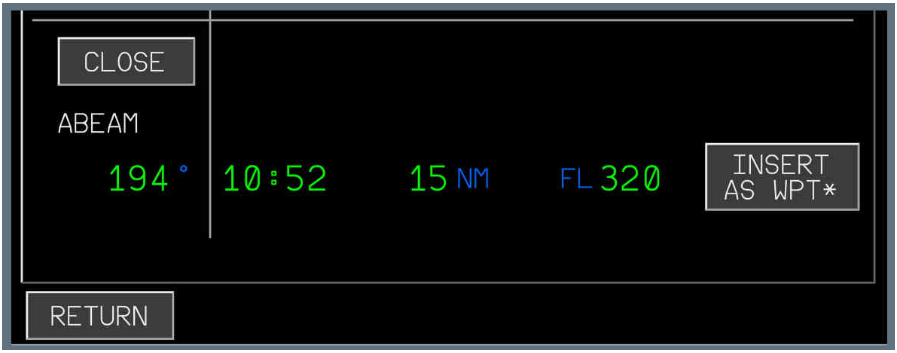
Ident.: DSC-22-FMS-20-20-20-190-00003964.0001001 / 14 APR 14

ABEAM BUTTON

When clicked:
- The FMS computes and displays the abeam radial and the associated F-PLN INTERCEPT data (*Refer to F-PLN INTERCEPT Data*)
- The INSERT AS WPT button appears next to the F-PLN INTERCEPT data (*Refer to INSERT AS WPT Button*)
- The CLOSE button appears instead of the ABEAM button.

When the flight crew clicks on the CLOSE button, the abeam data on the FIX INFO page and on the ND are removed.

Abeam Data



Ident.: DSC-22-FMS-20-20-20-190-00003965.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).

L2 The RETURN button is displayed, only if there is no temporary flight plan on standby. If there is a temporary flight plan, the TMPY F-PLN button is displayed instead of the RETURN button. When the flight crew clicked on the TMPY F-PLN button, the ACTIVE/F-PLN page appears.

PURPOSE

The F-PLN page displays textual data that is related to the lateral and vertical flight plans. This data includes:

- All flight plan waypoints and flight legs
- Time, speed, altitude, fuel, and wind predictions for each waypoint

- Track and distance between waypoints
- Flight path angle for approach waypoints
- Flight leg RNP, if any.

The F-PLN page also provides access to all lateral and vertical revisions.
The F-PLN page is available for the active and secondary flight plans.

Ident.: DSC-22-FMS-20-20-20-200-00003967.0001001 / 14 APR 14

ACCESS

The flight crew can access:

- The ACTIVE/F-PLN page via:
  - The KCCU, by pressing the F-PLN or DEST key
    When the flight crew presses the F-PLN key, the first page of the flight plan (FROM waypoint on the first line) appears.
    When the flight crew presses the DEST key, the last page of the destination flight plan (destination airport on the last line) appears.

FROM LABEL

Indicates that the first line of the F-PLN page is the FROM waypoint.
The FROM label disappears, when the first line of the F-PLN page displays a waypoint that is not the FROM waypoint.

Ident.: DSC-22-FMS-20-20-20-200-00003969.0001001 / 22 APR 14

UTC(TIME) LABEL

Indicates the time reference:
- The UTC label indicates that the time reference is the UTC time
- The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:
- In the PREFLIGHT flight phase:
  - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - If the UTC time is valid, the time reference is the UTC time
  - If the UTC time is not valid, the time reference is the flight time.

D066M 08:09 190.8 132°/026
EFOB
True Wind Prediction

Indicates for each waypoint of the flight plan:
- The waypoint ident
- The time prediction
- The speed prediction
- The altitude prediction
- The Estimated Fuel On Board (EFOB)
- The true wind prediction.

For information about flight plan predictions, *Refer to DSC-22-FMS-10-40-70 Introduction*.
The F-PLN page displays a maximum of 9 waypoint data lines.
If a temporary flight plan is on standby, only 8 waypoint data lines are displayed.

COLORS

On the ACTIVE/F-PLN page, the waypoint data is displayed in:
- White, for the TO waypoint
- Green, for the waypoints of the destination flight plan
- Blue, for the waypoints of the missed approach and the alternate flight plan.

When a temporary flight plan is on standby, all waypoint data is displayed in yellow.

On the SEC/F-PLN page, the waypoint data of all waypoints is displayed in white.

Ident.: DSC-22-FMS-20-20-20-200-00003974.0001001 / 28 MAY 14

WAYPOINT IDENT

Indicates the ident of the flight plan waypoints and airports.

LFBO14L	A navigation database airport is indicated by its four-character ICAO code, followed by the selected runway, if any.
AMB	A navigation database waypoint is indicated by its ident (maximum of 7 characters).
AMB∆	A triangle next to the waypoint ident indicates that the aircraft will overfly the waypoint.
AMB→	A left or right arrow next to the waypoint ident indicates the turn direction of a procedure turn (that is stored in the navigation database).
(T/C)	A pseudo waypoint is displayed between parentheses. For more information about pseudo waypoints, *Refer to DSC-22-FMS-10-40-10 Pseudo Waypoints*.
L2 N32W170	A latitude/longitude waypoint is displayed in the XDDYDDD format: - The "X" is either “N” for north, or “S” for south - The "DD" corresponds to the two-degree characters of the latitude - The "Y" is either “E” for east, or “W” for west - The "DDD" corresponds to the three-degree characters of the longitude. For example, N32W170 corresponds to N32°45.5W170°23.3.
PBD03	A place/bearing/distance waypoint is displayed in the PBDNN format. The "NN" is a number from 01 to 20, that defines the chronological position in the list of the flight-crew created waypoints (e.g. AMB/320/5 is identified with the PBD03 ident, when this waypoint is the third flight-crew created waypoint).
PBX04	A place-bearing/place-bearing waypoint is displayed in the PBXNN format. The "NN" is a number from 01 to 20, that defines the chronological position in the list of the flight-crew-created waypoints (e.g. AMB–320/DVL–180 is identified with the PBX04 ident, when this waypoint is the fourth flight-crew-created waypoint).
PD05	A place/distance waypoint is displayed in the PDNN format. The "NN" is a number from 01 to 20, that defines the chronological position in list of the flight-crew-created waypoints (e.g. AMB/10 is identified with the PD05 ident, when this waypoint is the 5th flight-crew-created waypoint).

N42	A latitude crossing waypoint is displayed in the XNN format: - The "X" is either "N" for north, or "S" for south - The "NN" corresponds to the degrees of latitude.
E080	A longitude crossing waypoint is displayed in the YNNN format: - The Y is either "E" for east, or "W" for west - The "NNN" corresponds to the degrees of longitude.
BIS230	A radial intersection waypoint is displayed in the XXXNNN format. The "XXX" corresponds to the first- three characters of the reference fix, and the "NNN" corresponds to the radial.
D70BIS	A circle intersection waypoint is displayed in the DNNNXXX format. The "NNN" corresponds to the radius of the circle, and the "XXX" corresponds to the first-three characters of the reference fix.
ABBISBI	An abeam intersection waypoint is displayed in the ABXXXXX format. The "XXXXX" corresponds to the the first-5 characters of the reference fix.
15000	An altitude waypoint is displayed in the NNNNN format. The "NNNNN" corresponds to the altitude of the end of the flight leg.
T-P	Indicates a turning point. A turning point is inserted in the temporary flight plan, as the FROM waypoint, when a DIR TO or holding pattern at the present position is on standby. The turning point becomes a fix waypoint with the latitude/longitude of the position where the temporary flight plan is inserted.
IN-BND	An IN-BND waypoint is inserted in the temporary flight plan, as the FROM waypoint, when a DIR TO - CRS IN is on standby. The IN-BND waypoint becomes a fix waypoint with the latitude/longitude of the position where the temporary flight plan is inserted.
OUT-BND	An OUT-BND waypoint is inserted in the temporary flight plan, as the FROM waypoint, when a DIR TO - CRS OUT is on standby. The OUT-BND waypoint becomes a fix waypoint with the latitude/longitude of the position where the temporary flight plan is inserted.
PPOS	Indicates the aircraft present position. PPOS is displayed, as the FROM waypoint, when the aircraft is in a discontinuity.
INTCPT	Indicates the point at which the aircraft will intersect the FMS lateral flight plan.
MANUAL	Indicates a manual flight leg. The flight crew must manually ends the flight leg. (e.g. DIR TO).

L1 WAYPOINT REVISIONS

The waypoint ident is interactive: When clicked, opens the waypoint revisions menu (*Refer to Waypoint Revisions Menu*).

Ident.: DSC-22-FMS-20-20-20-200-00003975.0001001 / 22 APR 14

WAYPOINT REVISIONS MENU

The waypoint revisions menu provides access to the lateral and vertical revisions.
The waypoint revisions menu on the ACTIVE/F-PLN page is different from the waypoint revisions menu on the SEC/F-PLN page.

Note: *The star (*) next to the revision label indicates that the revision does not require the display of a specific page or window, before the revision is applied. When the flight crew selects a revision with no star, the MFD displays a page or window that is associated with the selected revision.*

FROM P.POS DIR TO

When selected:

- Displays the DIRECT TO page (*Refer to page*)
- Creates a temporary flight plan with a direct flight leg to the revised waypoint.

The FROM P.POS DIR TO revision is not available in the waypoint revisions menu of the SEC/F-PLN page.
For information about the DIR TO revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

INSERT NEXT WPT

When selected, opens the INSERT NEXT WPT window (*Refer to INSERT NEXT WPT Window*).

For information about the INSERT NEXT WPT revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

DELETE

When selected:
- Deletes the revised waypoint
- Creates or updates the temporary flight plan.

For information about the DELETE revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

DEPARTURE

When selected, displays the DEPARTURE page (*Refer to page*).
For information about the DEPARTURE revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

ARRIVAL

When selected, displays the ARRIVAL page (*Refer to page*).
For information about the ARRIVAL revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

OFFSET

When selected, displays the OFFSET page (*Refer to page*).
For information about the OFFSET revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

OVERFLY

When selected:
- Defines an overfly on the revised waypoint
- Creates or updates the temporary flight plan.

When there is an overfly on the revised waypoint, the waypoint revisions menu displays DELETE OVERFLY *. When selected, removes the overfly from the revised waypoint, and creates or updates the temporary flight plan.
For information about the OVERFLY revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

HOLD

When selected, displays the HOLD page (*Refer to page*).
For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

AIRWAYS

When selected, displays the AIRWAYS page (*Refer to page*).
For information about the AIRWAYS revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

ENABLE ALTN

When selected:
- Activates the alternate flight plan
- Creates or updates the temporary flight plan.

For information about the ENABLE ALTN revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

NEW DEST

When selected, displays the NEW DEST window (*Refer to NEW DEST Window*).
For information about the NEW DEST revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

CONSTRAINTS

When selected, displays the ALT panel of the VERT REV page (*Refer to page*).
For information about the ALT CSTR revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

CMS

When selected, displays the CMS panel of the VERT REV page (*Refer to page*).
For information about the CMS revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

STEP ALTs

When selected, displays the STEP ALTs panel of the VERT REV page (*Refer to page*).
For information about the STEP ALTs revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

WIND

When selected:
- If the revised waypoint is a climb waypoint, displays the CLB panel of the WIND page (*Refer to page*)
- If the revised waypoint is a cruise waypoint, displays the CRZ panel of the WIND page (*Refer to page*)
- If the revised waypoint is a descent waypoint, displays the DES panel of the WIND page (*Refer to page*).

For information about the WIND revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

WHAT IF

When selected, displays the WHAT IF page (*Refer to page*).
The WHAT IF revision is not available in the waypoint revisions menu of the ACTIVE/F-PLN page.
For information about the WHAT IF function, *Refer to DSC-22-FMS-10-40-40 WHAT IF Function*.

Ident.: DSC-22-FMS-20-20-20-200-00003996.0001001 / 22 APR 14

INSERT NEXT WPT Window

REVISED WAYPOINT

The revised waypoint is the waypoint from which the flight crew selected the INSERT NEXT WPT revision.

REVISED WAYPOINT LATITUDE/LONGITUDE

Indicates the latitude and longitude of the revised waypoint.

NEXT WPT LIST

Indicates the next waypoint.

The flight crew enters the next waypoint via the keyboard, or by selecting the next waypoint from the NEXT WPT list.
The NEXT WPT list displays all of the flight plan waypoints between the revised waypoint and the destination airport.

L2 If the revised waypoint is a missed approach waypoint, the last waypoint of the list is the last waypoint of the missed approach.
If the revised waypoint is a part of the alternate flight plan, the last waypoint of the list is the last waypoint of the alternate flight plan.

L1 The next waypoint can be one of the following:
- A waypoint of the navigation database or pilot-stored elements database
- A latitude/longitude waypoint
- A place/bearing/distance waypoint
- A place-bearing/place-bearing waypoint
- A place/distance waypoint.

If the flight crew inserts a next waypoint that is a latitude/longitude, place/bearing/distance, place-bearing/place-bearing, or place/distance waypoint, the FMS stores this waypoint in the pilot-stored elements database.

L2 For more information about the pilot-stored elements database, *Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database*.

L1 Entry Format

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Latitude/longitude waypoint, *Refer to DSC-22-FMS-20-80 LAT/LONG*
- Place/bearing/distance waypoint, *Refer to DSC-22-FMS-20-80 PLACE/BEARING/DISTANCE (PBD)*
- Place-bearing/place-bearing waypoint, *Refer to DSC-22-FMS-20-80 PLACE-BEARING/PLACE-BEARING (PB/PB)*
- Place/distance waypoint, *Refer to DSC-22-FMS-20-80 PLACE/DISTANCE (PD)* .

Note: *The flight crew can enter a place/distance waypoint, relative to the revised waypoint, by entering:*
- *The plus or minus sign, and the distance value (the sign is mandatory) (e.g. +15), or*
- *A slash, the plus or minus sign, and the distance value (the plus sign is not mandatory, if the slash is used) (e.g. /15).*

CANCEL BUTTON

When clicked, closes the INSERT NEXT WPT window without inserting any waypoint.

REVISED WAYPOINT

The revised waypoint is the waypoint from which the flight crew selected the NEW DEST revision.

NEW DEST ENTRY FIELD

The flight crew enters the four-character ICAO code of the new destination airport in the entry field.

Entry Format

Refer to DSC-22-FMS-20-80 AIRPORT (ARPT).

CANCEL BUTTON

When clicked, closes the NEW DEST window without inserting a new destination.

Ident.: DSC-22-FMS-20-20-20-200-00003976.0001001 / 22 APR 14

TIME PREDICTION

Indicates the Estimated Time of Arrival (ETA), in UTC(flight) time, at the waypoint.

TIME CONSTRAINT

The time prediction is interactive: When clicked, displays the RTA panel of the VERT REV page (*Refer to page*).
On the RTA panel of the VERT REV page, the flight crew can check, add, or change a time constraint on the revised waypoint.
If there is a time constraint at a waypoint, a star is displayed to the left of the time prediction.

The star appears in magenta, if the time constraint is respected.

The star appears in amber, if the time constraint is missed.

L2

If there is a time constraint on a waypoint and time predictions are not available, the time constraint value is displayed in large magenta font.
A plus(minus) sign appears before the constraint value for an AT OR AFTER(AT OR BEFORE) constraint.

L1 For information about time constraint (RTA) revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

FROM WAYPOINT

In flight, the time prediction of the FROM waypoint displays the time at which the FROM waypoint was sequenced.
In preflight, the time prediction of the FROM waypoint displays the ETT in magenta. If there is no ETT , the time prediction displays 00:00.
When clicked, opens the RTA panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*).
On the RTA panel of the VERT REV page, the flight crew can change the ETT, if necessary.
If the ETT is exceeded, the UTC time appears in green instead of the ETT.

Ident.: DSC-22-FMS-20-20-20-200-00003977.0001001 / 22 APR 14

SPEED PREDICTION

Indicates the predicted speed(Mach) at the waypoint.

A ditto mark (") appears instead of the value, if the predicted speed(Mach) value is the same as the predicted speed(Mach) value at the previous waypoint.

SPEED CONSTRAINT/CMS

The speed prediction is interactive. When clicked, opens:

- The SPD panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*), when the speed prediction is related to a climb, descent, or approach waypoint
- The CMS panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*), when the speed prediction is related to a cruise waypoint.

If there is a speed constraint at a waypoint, or if the waypoint is part of a CMS, a star is displayed to the left of the speed prediction.

The star appears in magenta, if the speed constraint is respected.

The star appears in amber, if the speed constraint is missed.

If there is a speed constraint at a waypoint and the speed predictions are not available, the speed constraint value is displayed in large magenta font.

For information about:

- The SPD CSTR revision, *Refer to DSC-22-FMS-10-40-30 Purpose*
- The SPD LIMIT revision, *Refer to DSC-22-FMS-10-40-30 Purpose*
- The CMS revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

FROM WAYPOINT

In preflight, the speed prediction of the FROM waypoint displays V1.

Ident.: DSC-22-FMS-20-20-20-200-00003978.0001001 / 14 APR 14

ALTITUDE PREDICTION

Indicates the predicted altitude at the waypoint.

A ditto mark (") appears instead of the value, if the predicted altitude value is the same as the predicted altitude value at the previous waypoint.

ALTITUDE CONSTRAINT/STEP ALT s

The altitude prediction is interactive. When clicked, opens:

- The ALT panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*), when the altitude prediction is related to a climb, descent, or approach waypoint
- The STEP ALTs panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*), when the altitude prediction is related to a cruise waypoint.

If there is an altitude constraint at a waypoint, a star is displayed to the left of the altitude prediction.

*FL055

The star appears in magenta, if the altitude constraint is respected.

*FL055

The star appears in amber, if the altitude constraint is missed.

L2

+5000

If there is an altitude constraint at a waypoint and the altitude predictions are not available, the altitude constraint value (or WINDOW) is displayed in large magenta font. A plus(minus) sign appears before the constraint value for an AT OR ABOVE(AT OR BELOW) constraint.

L1 For information about:

- The ALT CSTR revision, *Refer to DSC-22-FMS-10-40-30 Purpose*
- The STEP ALTs revision,*Refer to DSC-22-FMS-10-40-30 Purpose*.

FROM WAYPOINT

In flight, the altitude prediction of the FROM waypoint displays the altitude of the aircraft at which the FROM waypoint was sequenced.

Ident.: DSC-22-FMS-20-20-20-200-00003979.0001001 / 22 APR 14

EFOB

Indicates the Estimated Fuel On Board (EFOB) at the waypoint.

L2 A ditto mark (") appears instead of the value, if the EFOB value is the same as the EFOB value at the previous waypoint.

L1

FROM WAYPOINT

In flight, the EFOB of the FROM waypoint displays the fuel quantity that was on board, when the FROM waypoint was sequenced.

Ident.: DSC-22-FMS-20-20-20-200-00003980.0001001 / 22 APR 14

TRUE WIND PREDICTION

Indicates the predicted true wind (direction and speed) at the waypoint.

Note: *The F-PLN page displays the true wind prediction that is not corrected with the measured wind. However, the FMS uses the corrected wind to compute the other flight plan predictions (e.g. time, altitude, fuel, etc.).*

L2 A ditto mark (") appears instead of the direction(speed) value, if the predicted direction(speed) value is the same as the predicted direction(speed) value at the previous waypoint.

L1

TRIP WIND

If the flight crew only entered a trip wind, the trip wind is displayed as the wind prediction for each flight plan waypoint, in the HD/NNN or TL/NNN format .

WIND ENTRY

The true wind prediction is interactive. When clicked, opens:

- The CLB panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*), when the true wind prediction is related to a climb waypoint
- The CRZ panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*), when the true wind prediction is related to a cruise waypoint
- The DES panel of the VERT REV page (*Refer to DSC-22-FMS-20-20-20 VERT REV Page*), when the true wind prediction is related to a descent waypoint.

For more information about the WIND revisions, *Refer to DSC-22-FMS-10-40-30 Purpose*.

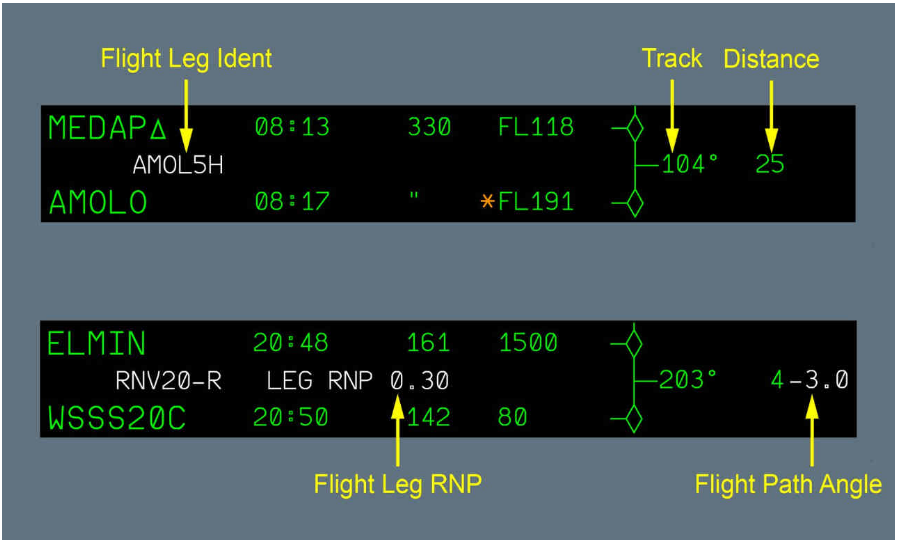
FROM WAYPOINT

The true wind prediction of the FROM waypoint displays the trip wind or the predicted wind.

Ident.: DSC-22-FMS-20-20-20-200-00003982.0001001 / 22 APR 14

FLIGHT LEG DATA

Flight Leg Data



Flight Leg Ident
Track
Distance
MEDAPA∆ 08:13 330 FL118

RNV20-R LEG RNP 0.30
203° 4 -3.0
WSSS20C 20:50 142 80
Flight Leg RNP
Flight Path Angle

Indicates for each flight leg:

- The leg ident
- The distance between two waypoints
- The flight leg track
- The flight leg RNP (if the RNP value is stored in the navigation database)
- The flight path angle (only for flight legs of the arrival procedure).

The F-PLN page displays a maximum of 8 flight-leg data lines.
If a temporary flight plan is on standby, only 7 flight-leg data lines are displayed.

COLORS

On the ACTIVE/F-PLN page:

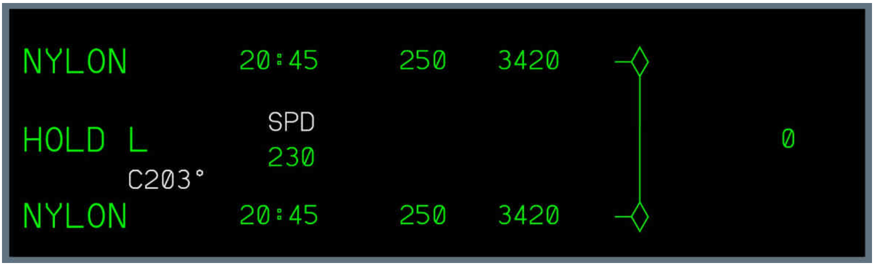
- The flight leg ident, the flight path angle, and the flight leg RNP are displayed in white
- The other leg data is displayed in:
  - White, for the active flight leg
  - Green, for the flight legs of the destination flight plan
  - Blue, for the flight legs of the missed approach and the alternate flight plan.

When a temporary flight plan is on standby, all flight leg data is displayed in yellow.
On the SEC/F-PLN page, the flight leg data is displayed in white.

FLIGHT LEG OF A HOLDING PATTERN

A flight leg of a holding pattern is displayed on one entire line between the holding entry fix and the holding exit fix.

Flight Leg of a Holding Pattern



For information about the specific display for the different type of holding pattern, *Refer to DSC-22-FMS-10-40-20 Controls and Indicators*.

Ident.: DSC-22-FMS-20-20-20-200-00003983.0001001 / 22 APR 14

FLIGHT LEG IDENT

Indicates the ident of the flight leg.

AFRI5A	A flight leg that is a part of a departure(arrival) procedure has the name of the departure(arrival) procedure.
UT210	A flight leg that is a part of an airway has the name of the airway.
←UT210	An offset flight leg is indicated with a left or right arrow next to the flight leg ident. The arrow indicates the offset side.
L2 C144°T	A course flight leg is displayed in the CNNN° format. The "NNN" corresponds to the course. The T letter appears after the degree symbol, if the course is defined in the true north reference.
H144°T	A heading flight leg is displayed in the HNNN° format. The "NNN" corresponds to the heading. The T letter appears after the degree symbol, if the heading is defined in the true north reference.
22 TOU	An arc flight leg is displayed in the NN XXX format. The "NN" corresponds to the arc distance, and the "XXX" corresponds to the navaid ident.
22 ARC	A radius flight leg is displayed in the NN ARC format. The "NN" corresponds to the arc distance.
FIN144°T	A flight leg with a manual or altitude termination point is displayed in the XXXNNN format. The "XXX" corresponds to the first three characters of the waypoint ident, and the "NNN" corresponds to the outbound course. The T letter appears after the outbound course, if the outbound course is defined in the true north reference.
PROC L	A procedure turn is displayed in the PROC X format. The "X" is “L” for left, or “R” for right, depending on the turn direction.

Ident.: DSC-22-FMS-20-20-20-200-00003984.0001001 / 22 APR 14

TRACK

Indicates the track between two waypoints.
The track is magnetic or true, depending on the TRUE/MAG setting of the AFS CP.

104°	Magnetic track.
104°T	True track.

ACTIVE FLIGHT LEG

In flight, the track of the active flight leg displays the direct bearing between the aircraft present position and the TO waypoint.

Ident.: DSC-22-FMS-20-20-20-200-00003985.0001001 / 22 APR 14

DISTANCE

Indicates the distance between two waypoints.

ACTIVE FLIGHT LEG

In flight, the distance of the active flight leg displays the distance between the aircraft present position and the TO waypoint.

Ident.: DSC-22-FMS-20-20-20-200-00003994.0001001 / 20 OCT 14

FLIGHT LEG RNP

Indicates the RNP that is associated with the flight leg.
The displayed RNP is the RNP value that is stored in the navigation database.
The flight crew can change the RNP value that is associated with the flight leg, via the POSITION/MONITOR page (*Refer to DSC-22-FMS-20-20-20 POSITION/MONITOR Page*).
However, even if manually changed, the displayed value on the F-PLN page remains the value that is stored in the navigation database.
If there are several RNP values that are associated with the same flight leg, the F-PLN page displays the lower RNP value.

L2 A ditto mark (") appears instead of the FLIGHT LEG RNP label and the associated value, if the RNP value is the same as the RNP that is associated with the previous flight leg.

L1 For more information about the RNP, *Refer to DSC-34-NAV-20-10-60 Position Accuracy and Navigation Accuracy*.

Ident.: DSC-22-FMS-20-20-20-200-00003986.0001001 / 22 APR 14

FLIGHT PATH ANGLE

Indicates the Flight Path Angle (FPA) that is associated with a flight leg of the arrival procedure. The displayed FPA is the FPA value that is stored in the navigation database. The flight crew cannot change this value.

Ident.: DSC-22-FMS-20-20-20-200-00003981.0001001 / 20 OCT 14

SPECIAL FLIGHT PLAN LABELS

- DISCONTINUITY -

Indicates a flight plan discontinuity.
For information about flight plan discontinuity, *Refer to DSC-22-FMS-10-40-10 Flight Legs*.

When clicked, opens the waypoint revisions menu (*Refer to Waypoint Revisions Menu*) from which the flight crew can select the following revisions:
- INSERT NEXT WPT
- DELETE
- OFFSET
- ENABLE ALTN
- NEW DEST.

- TOO STEEP PATH -

Indicates the start of a path, in the vertical descent profile, that is too steep.
When clicked, opens the waypoint revisions menu (*Refer to Waypoint Revisions Menu*) from which the flight crew can select only the INSERT NEXT WPT revision.

- (ABEAM PTS) -

The (ABEAM PTS) label appears in the temporary flight plan, when a DIR TO - DIRECT WITH ABEAM is on standby. When the temporary flight plan is inserted, the (ABEAM PTS) label is removed, and the fix abeam waypoints are displayed.

- WHAT IF - DEPRESS -

e WHAT IF - DEPRESS label appears in a secondary flight plan, when:
- This secondary flight plan contains a WHAT IF scenario
- The WHAT IF scenario is simulated depressurization.

The WHAT IF - DEPRESS label appears below the waypoint from which depressurization is simulated.

- WHAT IF - EO -

The WHAT IF - EO label appears in a secondary flight plan, when:
- This secondary flight plan contains a WHAT IF scenario
- The WHAT IF scenario is a simulated engine-out.

The WHAT IF - EO label appears below the waypoint from which the engine-out is simulated.

Ident.: DSC-22-FMS-20-20-20-200-00003972.0001001 / 22 APR 14

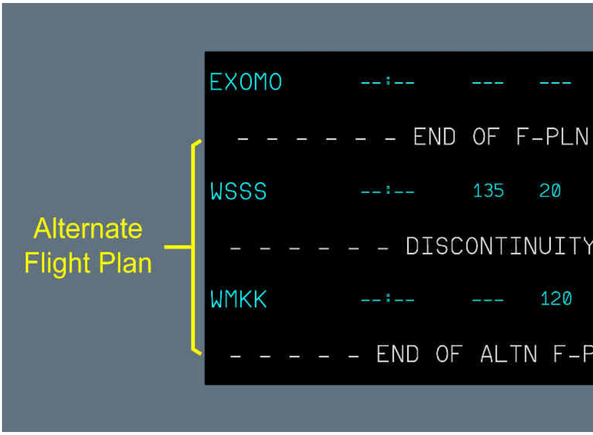
FLIGHT PLAN LIMIT LABELS

- END OF F-PLN -

Indicates the end of the destination flight plan. For information about the destination flight plan, *Refer to DSC-22-FMS-10-40-10 Destination Flight Plan*.

- END OF ALTN F-PLN -

dicates the end of the alternate flight plan. r information about the alternate flight plan, *Refer to DSC-22-FMS-10-40-10 Alternate Flight Plan*.



```
EXOMO      --:--    ---   ---

DEST
Distance to Destination

Indicates:
- The destination ident
- The destination ETA
- The destination EFOB
- The distance to destination.

Ident.: DSC-22-FMS-20-20-20-200-00003987.0001001 / 22 APR 14

DESTINATION IDENT BUTTON

The button label indicates the ident of the destination airport, followed by the selected runway, if any.
When clicked, displays the ARRIVAL page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-200-00003988.0001001 / 22 APR 14

DESTINATION ETA

Indicates the Estimated Time of Arrival (ETA), in UTC(flight) time, at the destination airport.

Ident.: DSC-22-FMS-20-20-20-200-00003989.0001001 / 22 APR 14

DESTINATION EFOB

Indicates the Estimated Fuel On Board (EFOB) at the destination airport.
The EFOB at the destination airport appears in amber, if its value is below the minimum fuel at destination that is displayed on the FUEL&LOAD page (*Refer to page*). In addition to the amber EFOB, if the active flight phase is CRZ, DES, APPR, or GA, the FMS message area displays the DEST EFOB BELOW MIN message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-200-00003990.0001001 / 22 APR 14

DISTANCE TO DESTINATION

The distance to destination is the sum of:
- The direct distance to the TO waypoint
- The distance along the flight plan from the TO waypoint to the destination airport.

L2 If a there is discontinuity in the flight plan, the FMS considers that the aircraft will fly a direct flight leg between the waypoints that define the discontinuity.

Ident.: DSC-22-FMS-20-20-20-200-00003992.0001001 / 22 APR 14

INIT BUTTON

When clicked, displays the INIT page (*Refer to page*).
L2 The INIT button is displayed only during the PREFLIGHT flight phase.

Ident.: DSC-22-FMS-20-20-20-200-00003993.0001001 / 22 APR 14

CPNY F-PLN REPORT

ALTERNATE

When selected, displays the ALTERNATE page (*Refer to page*).
For information about the ALTERNATE revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

CLOSEST AIRPORTS

When selected, displays the CLOSEST AIRPORTS page (*Refer to page*).
For information about the CLOSEST AIRPORTS function, *Refer to DSC-22-FMS-10-40-40 CLOSEST AIRPORTS Function*.

EQUI-TIME POINT

When selected, displays the EQUI-TIME POINT page (*Refer to page*).
For information about the ETP function, *Refer to DSC-22-FMS-10-40-40 Equi-Time Point (ETP) Function*.

FIX INFO

When selected, displays the FIX INFO page (*Refer to page*).

For information about the FIX INFO revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

LL CROSSING

When selected, displays the LL XING page (*Refer to page*).
For information about the LL CROSSING revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

TIME

When selected, displays the POSITION/TIME page (*Refer to page*).
For information about the TIME function, *Refer to DSC-22-FMS-10-80 Time Function*.

CPNY F-PLN REPORT

When selected, sends via ACARS an active flight plan report to the company ground station.
If the free text AMI option is activated, selecting CPNY F-PLN REPORT displays the COMPANY F-PLN REPORT page (*Refer to page*).
For information about flight reports, *Refer to DSC-22-FMS-10-40-80 Flight Reports*.

Ident.: DSC-22-FMS-20-20-20-200-00003991.0001001 / 22 APR 14

SCROLL BUTTONS

The flight crew uses the scroll down(up) button to move, page by page, downward(upward) through the flight plan.

L2 The flight crew can move, line by line, through the flight plan by using:
- The KCCU wheel, or
- The arrow keys of the KCCU keyboard.

For more information about the KCCU, *Refer to DSC-22-FMS-20-30 KCCU Controls for the FMS*.
The scroll-down(up) always stops at the last(first) flight plan waypoint.

Ident.: DSC-22-FMS-20-20-20-200-00003997.0001001 / 22 APR 14

DEST BUTTON

When clicked, displays the last page of the destination flight plan, with the destination airport on the last line.

L2 *Note:* *In order to display the first page of the active flight plan, the flight crew can:*
- *Press the F-PLN key of the KCCU, or*
- *Select F-PLN in the ACTIVE menu of the general menu bar.*

Ident.: DSC-22-FMS-20-20-20-200-00003998.0001001 / 22 APR 14

INSERT TMPY BUTTON

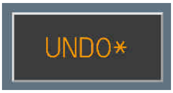
When clicked, inserts the temporary flight plan.

Ident.: DSC-22-FMS-20-20-20-200-00003999.0001001 / 22 APR 14

ERASE TMPY BUTTON

When clicked, erases the temporary flight plan.
When there is a temporary flight plan with multiple revisions, the button label is UNDO. When clicked, erases the last revision from the temporary flight plan.

UNDO Button



Note: *The flight crew can only UNDO the last flight plan revision. After the flight crew clicks one time on the UNDO button, the button label is ERASE TMPY.*

GW

Indicates the aircraft Gross Weight (GW).
The GW value is displayed only after engine start.
The FQMS provides the GW.

L2 If the FQMS cannot provide the GW, the FMS computes and displays the GW, based on the entered ZFW and on:
- The current FOB that is provided by the FQMS, if available, or
- The FOB that is stored by the FQMS just after engine start, and the current fuel used that is provided by the FADECs and the APU (when the APU is ON).

Ident.: DSC-22-FMS-20-20-20-210-00004003.0001001 / 14 APR 14

CG

Indicates the aircraft Center of Gravity (CG).
The CG value is displayed only after engine start.
The FQMS provides the CG.
L2 If the FQMS is failed, the WBBC provides the CG.

Ident.: DSC-22-FMS-20-20-20-210-00004004.0001001 / 22 APR 14

FOB

Indicates the quantity of Fuel On Board (FOB).
The FOB value is displayed only after engine start.
The FQMS provides the FOB.

L2 After engine start, if the FQMS is no longer able to provide the FOB, the FMS computes and displays the FOB, based on all of the following:
- The FOB that was stored by the FQMS just after engine start
- The current fuel used that is provided by the FADECs and the APU (when the APU is ON).

Ident.: DSC-22-FMS-20-20-20-210-00004005.0001001 / 22 APR 14

ZFW ENTRY FIELD

Indicates the aircraft Zero Fuel Weight (ZFW).
The ZFW entry field must not be empty.
The flight crew must enter the ZFW value.
L2 The FQMS uses this value to compute the aircraft gross weight.
The flight crew cannot clear the entry field.

L1 *Note:* *The FMS rejects the entered ZFW value and displays the* ENTRY OUT OF RANGE *message (Refer to message), if the flight crew enters a ZFW value that exceeds the acceptable range, as defined in the performance database.*

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ZFW.

Ident.: DSC-22-FMS-20-20-20-210-00004006.0001001 / 22 APR 14

ZFWCG ENTRY FIELD

Indicates the aircraft Zero Fuel Weight Center of Gravity (ZFWCG).
The ZFWCG entry field must not be empty.
The flight crew must enter the ZFWCG value.
L2 The FQMS uses this value to compute the aircraft CG.
The flight crew cannot clear the entry field.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 ZFWCG.

Ident.: DSC-22-FMS-20-20-20-210-00004007.0001001 / 22 APR 14

FUEL PLANNING BUTTON

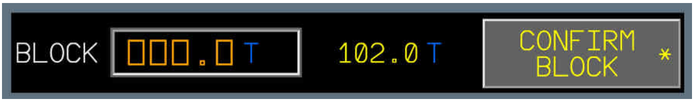
When clicked, initiates the fuel planning computation.
The fuel planning function first computes the trip fuel in accordance with the entered flight plan.
Then, the fuel planning function uses the trip fuel value, with the default or flight-crew-entered values for the taxi fuel, the route reserve fuel, and the minimum fuel at destination, to compute the minimum block fuel.
BLOCK = TAXI + TRIP + RTE RSV + MIN FUEL AT DEST
L2 If the flight crew did not manually enter a value in the MIN FUEL AT DEST entry field, the FMS uses the default or flight-crew-entered values of the ALTN and FINAL entry fields to compute the value of the minimum fuel at destination. In this case:
MIN FUEL AT DEST = ALTN + FINAL

L1 *Note:* *The fuel planning computation is based on the assumption that the extra fuel is equal to zero.*

L2 The fuel planning function is available, when all of the following apply:
- The engines are off
- The flight crew defined a flight plan and entered a cruise flight level
- The flight crew entered the ZFW and ZFWCG
- The flight crew did not enter any block fuel.

L1 The TRIP, ALTN, RTE RSV, and FINAL fuel (and time predictions) are automatically entered in the fuel planning table (*Refer to Fuel Planning Table*).
The FMS-computed block fuel is displayed in yellow next to the BLOCK entry field.

FMS-Computed Block Fuel



The flight crew can confirm the FMS-computed block fuel, by clicking on the CONFIRM BLOCK button.
After the flight crew confirms the FMS-computed block fuel, the value automatically appears in the BLOCK entry field.

Note: *The FMS-computed block fuel automatically disappears, when the flight crew manually enters a value in the BLOCK entry field.*

Ident.: DSC-22-FMS-20-20-20-210-00004008.0001001 / 07 MAY 18

BLOCK ENTRY FIELD

Indicates the block fuel.
The BLOCK entry field must not be empty.

The block fuel value is:
- Manually entered by the flight crew, or
- Automatically entered, when the flight crew confirms the FMS-computed block fuel.

L2 For aircraft equipped with the REFUEL pb-sw , the FQMS uses the BLOCK fuel value as a target for refueling (*Refer to PRO-NOR-SUP-SUP-FUEL Automatic Refueling*).

L1 The BLOCK entry field disappears after engine start.

L2 Before engine start, the FMS uses the block fuel value to compute the fuel predictions. After engine start, the FMS uses the FOB, provided by the FQMS.

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 BLOCK (FUEL).

Ident.: DSC-22-FMS-20-20-20-210-00004009.0001001 / 03 JAN 20

FUEL PLANNING TABLE

The fuel planning table provides the results of the fuel planning computation.
The fuel planning computation is performed after a value is entered in the BLOCK entry field, or after clicking on the FUEL PLANNING button (in this last case, the minimum block fuel is computed for an extra fuel equal to zero).

L2 The fuel planning table is updated, when one of the following occurs:
- Any value in the fuel planning table is changed
- A lateral or vertical revision is performed
- L3 The FMS speed mode (ECON/LRC) is changed
- The CI that is associated with the ECON mode is changed
- The maximum cabin rate is changed
- The cruise temperature, SAT, or tropopause altitude is changed
- A preselected speed is entered or changed.

TAXI Fuel Entry Field
TRIP Fuel and Time
RTE RSV Fuel and Percentage Entry Fields
ALTN Fuel Entry Field and Time
FINAL Fuel and Time Entry Fields

L1

TAXI FUEL ENTRY FIELD

Indicates the taxi fuel.
The taxi fuel is the fuel quantity necessary for taxi.
The default value for the taxi fuel is defined in the company fuel policy of the AMI file. The flight crew can override the default value.

L2 At takeoff, the TAXI fuel entry field displays dashes, and can no longer be changed.

L1 Entry Format

Refer to DSC-22-FMS-20-80 TAXI (FUEL).

TRIP FUEL AND TIME

Indicates the trip fuel and the trip time.
The trip fuel(time) is the fuel quantity(time) that is necessary for the trip from takeoff at the departure airport (or from the P.POS in flight) to landing at the destination airport.

RTE RSV FUEL AND PERCENTAGE ENTRY FIELDS

Indicates the route reserve fuel and the route reserve percentage.

The method to compute the route reserve and the default value are defined in the company fuel policy of the AMI file. The route reserve is a percentage of either:
- The trip fuel, or
- The trip fuel plus the alternate fuel.

The flight crew can override the default value.

L2 At takeoff, the RTE RSV fuel entry field is set to 0. The route reserve fuel is included in the extra fuel.

L1 Entry Format

For the entry format of:
- Route reserve fuel, *Refer to DSC-22-FMS-20-80 RTE RSV (FUEL)*
- Route reserve percentage, *Refer to DSC-22-FMS-20-80 RTE RSV (%)*.

ALTN FUEL ENTRY FIELD AND TIME

Indicates the alternate fuel and the alternate time.

The alternate fuel(time) is the fuel quantity(time) that is necessary for all of the following:
- The flight between the destination airport and the alternate airport
- The approach and landing at the alternate airport.

The FMS computes the default value.

L2 The computation of the default value is based on the following assumptions:
- The FMS speed mode (ECON/LRC) is LRC (in order to optimize the fuel consumption)
- The cruise flight level is:
  - FL 100, if the distance of the alternate flight plan is less than 100 NM
  - FL 220, if the distance of the alternate flight plan is equal to or more than 100 NM and less than 200 NM
  - FL 310, if the distance of the alternate flight plan is equal to or more than 200 NM.

L1 The flight crew can override the default value.

Note: *1. The FMS automatically synchronizes the ALTN fuel entry field of the ACTIVE/FUEL&LOAD page and the ALTN FUEL entry field of the ACTIVE/F-PLN/ALTERNATE page (Refer to page).*
2. The FMS automatically synchronizes the ALTN fuel entry field of the SEC1(2)(3)/FUEL&LOAD page and the ALTN FUEL entry field of the SEC1(2)(3)/F-PLN/ALTERNATE page (Refer to page).

Entry Format

Refer to DSC-22-FMS-20-80 ALTN (FUEL).

FINAL FUEL AND TIME ENTRY FIELDS

Indicates the final fuel and final time.
The final fuel(time) is the fuel quantity(time) that is necessary for a holding pattern that the aircraft can fly at either the destination airport or the alternate airport.

L2 The company fuel policy of the AMI file defines the parameters that the FMS uses to compute the final fuel(time) and the default values.

L1 The flight crew can override the default values.

L3 For the final reserve fuel computation the system assumes a 30 min holding pattern at 1 500 ft AGL, with the aircraft in CONF 1 at maximum endurance speed (racetrack pattern, altitude and selected airport can by modified through the "airline fuel policy" section of the AMI).

L1 Entry Format

For the entry format of:
- Final fuel, *Refer to DSC-22-FMS-20-80 FINAL (FUEL)*
- Final time, *Refer to DSC-22-FMS-20-80 FINAL (TIME)*.

Ident.: DSC-22-FMS-20-20-20-210-00004012.0001001 / 22 APR 14

PAX NBR ENTRY FIELD

Indicates the number of passengers.
The PAX entry field must not be empty.
The flight crew must enter the PAX number.

L2 The air conditioning system uses the PAX number.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 PAX NBR.

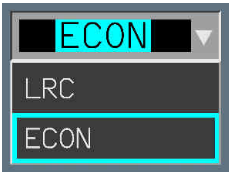
Ident.: DSC-22-FMS-20-20-20-210-00005201.0001001 / 02 APR 15

MODE LIST

Indicates the FMS speed mode.
The flight crew selects the FMS speed mode from the MODE list.

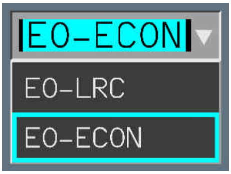
The MODE list has the following options:
- LRC: The FMS computes the optimum speed/Mach that corresponds to the Long Range Cruise (LRC)
  In LRC mode, the optimum speed/Mach is referred to as the LRC speed.
- ECON: The FMS computes the optimum speed/Mach based on the CI value that is entered in the CI entry field.
  In ECON mode, the optimum speed/Mach is referred to as the ECON speed.

MODE List



If the EO mode is active, the MODE list has the following options:
- EO-LRC: The FMS computes the optimum speed/Mach that corresponds to the Long Range Cruise (LRC)
  In EO-LRC mode, the FMS takes the engine failure into account to compute the optimum speed/Mach. The optimum speed/Mach is referred to as the EO-LRC speed.
- EO-ECON: The FMS computes the optimum speed/Mach based on the CI value that is entered in the CI entry field.
  In EO-ECON mode, the FMS takes the engine failure into account to compute the optimum speed/Mach. The optimum speed/Mach is referred to as the EO-ECON speed.

MODE List in EO Mode



Note: *1. The FMS automatically synchronizes all of the following:*
- *The MODE list of the ACTIVE/FUEL&LOAD page*
- *The MODE list of the ACTIVE/INIT page (Refer to page)*
- *The MODE list of the CLB, CRZ, and DES panels of the ACTIVE/PERF page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The MODE list of the SEC1(2)(3)/FUEL&LOAD page*
- *The MODE list of the SEC1(2)(3)/INIT page (Refer to page)*
- *The MODE list of the CLB, CRZ, and DES panels of the SEC1(2)(3)/PERF page (Refer to page).*

For more information about the FMS speed mode, *Refer to DSC-22-FMS-10-50-20 FMS Speed Mode (ECON/LRC)*.

DEFAULT SELECTION

At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
- Selects the LRC mode
- Sets the CI value to 0.

LIMITATIONS

The flight crew cannot change the FMS speed mode, when the DES, APPR, GA, or DONE flight phase is active.

Ident.: DSC-22-FMS-20-20-20-210-00004013.0001001 / 30 APR 14

CI ENTRY FIELD

Indicates the Cost Index (CI).
The CI entry field must not be empty.

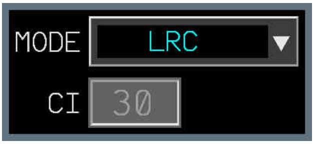
The CI value is:
- Manually entered by the flight crew, or
- Automatically entered, if one of the following occurs:
  - The flight crew enters a company route in the CPNY RTE entry field, and a CI is associated with the entered company route
  - A received company or ATC flight plan is inserted, and a CI is associated with the route of the received flight plan.

Note: *1. The FMS automatically synchronizes all of the following:*
- *The CI entry field of the ACTIVE/FUEL&LOAD page*
- *The CI entry field of the ACTIVE/INIT page (Refer to page)*
- *The CI entry field of the CLB, CRZ, and DES panels of the ACTIVE/PERF page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The CI entry field of the SEC1(2)(3)/FUEL&LOAD page*
- *The CI entry field of the SEC1(2)(3)/INIT page (Refer to page)*
- *The CI entry field of the CLB, CRZ, and DES panels of the SEC1(2)(3)/PERF page (Refer to page).*

If the FMS speed mode is LRC, the CI entry field still displays the CI value that is associated with the ECON mode, but the flight crew cannot change the CI value.

CI Entry Field in LRC Mode

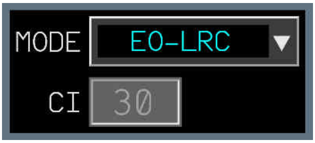


MODE LRC

CI 30

If the FMS speed mode is EO-LRC, the CI entry field still displays the CI value that is associated with the EO-ECON mode, but the flight crew cannot change the CI value.

CI Entry Field in EO-LRC Mode



MODE EO-LRC

CI 30

For more information about the CI, *Refer to DSC-22-FMS-10-50-20 FMS Speed Mode (ECON/LRC)*.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 COST INDEX (CI).

DEFAULT VALUE

At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
- Selects the LRC mode
- Sets the CI value to 0.

LIMITATIONS

The CI cannot be changed, when the DES, APPR, or GA flight phase is active.

Ident.: DSC-22-FMS-20-20-20-210-00013686.0001001 / 14 APR 16

JTSN GW ENTRY FIELD ⩤

Indicates the Jettison Gross Weight (JTSN GW).
The flight crew enters the JTSN GW. The entered JTSN GW corresponds to the aircraft GW that the flight crew wants to obtain after fuel jettison.
The FQMS uses the entered JTSN GW to automatically stop the fuel jettison, when the aircraft GW reaches the entered JTSN GW.
For more information about fuel jettison, *Refer to DSC-28-40 Fuel Jettison (If Installed)*.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 JTSN GW

Ident.: DSC-22-FMS-20-20-20-210-00004010.0001001 / 22 APR 14

TOW

Indicates the Takeoff Weight (TOW).

- **Before engine start:**
  TOW = ZFW + block fuel - taxi fuel
- **After engine start:**
  TOW = GW - taxi fuel
- L2 **In flight:**
  TOW = GW

Ident.: DSC-22-FMS-20-20-20-210-00004011.0001001 / 22 APR 14

LW

Indicates the Landing Weight (LW).

- **Before engine start:**
  LW = TOW - trip fuel
- **After engine start:**
  LW = GW - trip fuel - taxi fuel
- **In flight:**
  LW = GW - trip fuel

DEST/ALTN TABLE

The DEST/ALTN table provides:

- The Estimated Time of Arrival (ETA), in UTC(flight) time, at the destination and alternate airports

  The UTC(TIME) label indicates the time reference:
  - The UTC label indicates that the time reference is the UTC time
  - The TIME label indicates that the time reference is the flight time.

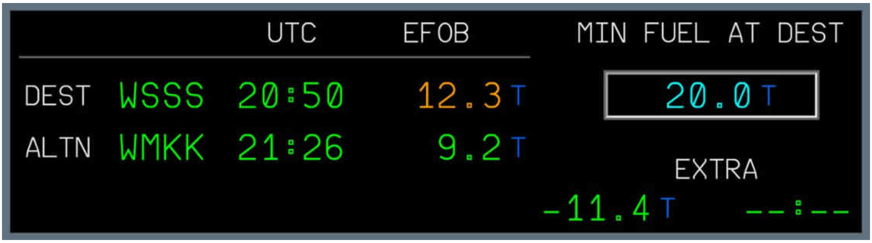
  L2 The time reference is defined as follows:
  - In the PREFLIGHT flight phase:
    - ■ If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
    - ■ If there is no entered ETT, the time reference is the flight time

    The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
  - In flight:
    - ■ If the UTC time is valid, the time reference is the UTC time
    - ■ If the UTC time is not valid, the time reference is the flight time.

- L1 The Estimated Fuel on Board (EFOB) at the destination and alternate airports.
  The EFOB at the destination airport is displayed in amber, if its value is below the minimum fuel at destination. In addition to the amber EFOB, if the active flight phase is CRZ, DES, APPR, or GA, the FMS message area displays the DEST EFOB BELOW MIN message (*Refer to message*).

  In addition to the amber EFOB:
  - If the active flight phase is CRZ, DES, APPR, or GA, the FMS message area displays the DEST EFOB BELOW MIN message (*Refer to message*)
  - During preflight and cruise, the WD displays the DEST EFOB memo.

EFOB at DEST Less than MIN FUEL AT DEST



Note: On the SEC/FUEL&LOAD page, the EFOB at the destination airport is always displayed in white (even if its value is below the minimum fuel at destination).

Ident.: DSC-22-FMS-20-20-20-210-00004015.0001001 / 22 APR 14

MIN FUEL AT DEST ENTRY FIELD

Indicates the minimum fuel at destination.
The minimum fuel at destination is the minimum fuel quantity at the destination airport.

The minimum fuel at destination can be either:
- Manually entered by the flight crew, or
- Computed by the FMS, if the flight crew did not enter any MIN FUEL AT DEST value. In this case:
  MIN FUEL AT DEST = ALTN + FINAL

If the flight crew manually enters a MIN FUEL AT DEST value and this value is below ALTN + FINAL, the FMS message area displays the CHECK MIN FUEL AT DEST message (*Refer to message*).
If the flight crew tries to clear the MIN FUEL AT DEST entry field without entering any value, the FMS message area displays the NOT ALLOWED message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-210-00005200.0001001 / 22 APR 14

EXTRA

Indicates the extra fuel and the extra time.
The extra fuel(time) is the fuel quantity(time) that will remain after landing at the destination airport, minus the minimum fuel at destination.
In the PREFLIGHT flight phase, the extra fuel is computed as follows:
EXTRA = BLOCK (or FOB, after engine start) - TAXI - TRIP - MIN FUEL AT DEST - RTE RSV
In flight, the EXTRA fuel is:
EXTRA = FOB - TRIP - MIN FUEL AT DEST
At takeoff, the FMS sets the route reserve to 0, and includes the route reserve fuel in the extra fuel.

Ident.: DSC-22-FMS-20-20-20-210-00004017.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the ACTIVE/INIT page (*Refer to page*).
L2 The RETURN button appears, only if the flight crew accesses the FUEL&LOAD page via the ACTIVE/INIT page.

PURPOSE

On the HOLD page, the flight crew can:

- Check the parameters of a holding pattern that is defined at the revised waypoint, or
- Define a holding pattern (with a manual termination) at the revised waypoint.

  The flight crew inserts:
  - A holding pattern, stored in the navigation database
  - A holding pattern, computed by the FMS
  - A holding pattern, defined by the flight crew.

The revised waypoint of the flight plan is referred to as the holding fix. The holding fix is the start and end waypoint of the holding pattern.
The HOLD page is available for the active and secondary flight plans.

LINKS

For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-22-FMS-20-20-20-220-00004019.0001001 / 14 APR 14

ACCESS

The flight crew can access the HOLD page via the F-PLN page, by selecting HOLD in the waypoint revisions menu.

HOLDING PATTERN TYPE

Indicates the type of the holding pattern:

- DATABASE:
  The holding pattern is stored in the navigation database. To select a database holding pattern that is associated with the revised waypoint, the flight crew clicks on the DATABASE button (*Refer to DATABASE Button*).
- COMPUTED:
  The FMS computes the holding pattern. To select a computed holding pattern, the flight crew selects clicks on the COMPUTED button (*Refer to COMPUTED Button*).
- MODIFIED:
  The flight crew creates the holding pattern. To create the holding pattern, the flight crew enters the parameters in the entry fields.
  As soon as the flight crew changes a parameter of a database or computed holding pattern, the holding pattern becomes a modified holding pattern.
- There is no type label, when:
  - There is no holding pattern associated with the revised waypoint, or
  - The holding pattern is inserted with a departure or arrival procedure, or with a flight plan uplink.

Ident.: DSC-22-FMS-20-20-20-220-00004021.0001001 / 22 APR 14

HOLDING FIX

Indicates the start and end waypoint of the holding pattern.
The holding fix is the flight plan waypoint from which the flight crew selected the HOLD revision.

Ident.: DSC-22-FMS-20-20-20-220-00004022.0001001 / 22 APR 14

INBOUND CRS ENTRY FIELD

Indicates the inbound course of the holding pattern.
The inbound course is automatically entered, if the flight crew selects a database or computed holding pattern.
The flight crew can always manually change the automatically-entered value.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 INBOUND CRS.

Ident.: DSC-22-FMS-20-20-20-220-00004023.0001001 / 22 APR 14

TURN OPTION LIST

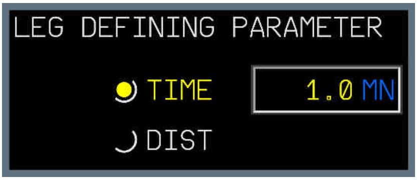
To select the turn side of the holding pattern, the flight crew selects one of the following options:
- LEFT
- RIGHT.

Ident.: DSC-22-FMS-20-20-20-220-00004024.0001001 / 22 APR 14

LEG DEFINING PARAMETER OPTION LIST

To select the parameter that defines the flight leg size, the flight crew selects one of the following options:
- TIME: A time defines the flight leg size
  When selected, displays the TIME entry field. The flight crew enters the time value in the TIME entry field.

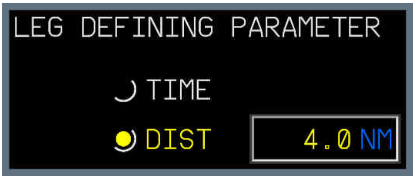
TIME Entry Field



LEG DEFINING PARAMETER
● TIME 1.0 MN
○ DIST

- DIST: A distance defines the flight leg size.
  When selected, displays the DIST entry field. The flight crew enters the distance value in the DIST entry field.

DIST Entry Field



LEG DEFINING PARAMETER
○ TIME
● DIST 4.0 NM

The parameter of the flight leg is automatically selected, and the associated value is automatically entered, if the flight crew selects a database or computed holding pattern.
The flight crew can always manually change the automatically-selected parameter and the associated automatically-entered value.

ENTRY FORMAT

For the entry format of:
- The time that defines the flight leg size, *Refer to DSC-22-FMS-20-80 HOLD TIME*
- The distance that defines the flight leg size, *Refer to DSC-22-FMS-20-80 HOLD DIST*.

Ident.: DSC-22-FMS-20-20-20-220-00004025.0001001 / 22 APR 14

LAST EXIT TIME AND FUEL

Indicates the estimated UTC(flight) time and the estimated quantity of remaining fuel at which the aircraft must exit the holding pattern, in order to comply with the fuel policy.

The UTC(TIME) label indicates the time reference:
- The UTC label indicates that the time reference is the UTC time
- The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:
- In the PREFLIGHT flight phase:
  - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - If the UTC time is valid, the time reference is the UTC time
  - If the UTC time is not valid, the time reference is the flight time.

L1 The fuel policy considers an extra fuel that is equal to 0 at landing at the destination airport.

Ident.: DSC-22-FMS-20-20-20-220-00004026.0001001 / 22 APR 14

DATABASE BUTTON

When clicked, displays the database holding pattern that is associated with the revised waypoint, and updates the temporary flight plan with this holding pattern.
If there is no database holding pattern for the revised waypoint, the DATABASE button is not available.

Ident.: DSC-22-FMS-20-20-20-220-00004027.0001001 / 14 APR 14

COMPUTED BUTTON

When clicked, computes and displays the holding pattern that is associated with the revised waypoint, and updates the temporary flight plan with this holding pattern.

L2 The computed holding pattern has the following parameters:

- Inbound course:
  - The track of the flight leg that is before the holding fix, or
  - The aircraft bearing, if the holding fix is P.POS
- Turn side: Right
- Leg size:
  - 1 min, if the predicted aircraft altitude at the holding pattern is below or equal to 14 000 ft , or
  - 1.5 min, if the predicted aircraft altitude at the holding pattern is above 14 000 ft.

Ident.: DSC-22-FMS-20-20-20-220-00004028.0001001 / 22 APR 14

TMPY F-PLN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).

L2 The TMPY F-PLN button is displayed, only if there is a temporary flight plan. If there is no temporary flight plan, the RETURN button is displayed instead of the TMPY F-PLN button. When the flight crew clicks on the RETURN button, the F-PLN page appears.

PURPOSE

The INIT page enables the flight crew to:

- Initialize the flight plan
- Access the pages that enable the flight crew to request the following data from the company ground station:
  - Flight plan data
  - Wind data
  - Takeoff data.

  When the data is received, the INIT page enables the flight crew to
  - Insert the received flight-plan data
  - Access the pages that display the received wind data and the received takeoff data.

The INIT page also guides the flight crew through the FMS initialization via specific buttons on the lower part of the page: IRS button, DEPARTURE button, NAVAIDS button, FUEL&LOAD button, and T.O PERF button.
The INIT page is available for the active and secondary flight plans.
The SEC/INIT page does not display the IRS button, the DEPARTURE button, the NAVAIDS button, the FUEL&LOAD button, and the T.O PERF button.

FLT NBR ENTRY FIELD

Indicates the flight number.
The FLT NBR entry field must not be empty.

The flight number is:
- Manually entered by the flight crew, or
- Automatically entered, if a received company flight plan is inserted.

L2 The entered flight number appears in the upper right corner of the MFD, even when the MFD does not display an FMS page.
The FMS sends the flight number to the ATC system for use in the ATC downlink messages.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 FLT NBR.

Ident.: DSC-22-FMS-20-20-20-230-00004032.0001001 / 14 APR 14

ACFT STATUS BUTTON

When clicked, displays the ACFT STATUS panel of the DATA/STATUS page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004033.0001001 / 22 APR 14

FROM/TO ENTRY FIELDS

Indicate the idents of the FROM/TO city-pair (i.e. departure airport and destination airport).
The FROM/TO entry fields must not be empty.

The idents of the FROM/TO city-pair are either:
- Manually entered by the flight crew, or
- Automatically entered, when one of the following occurs:
  - The flight crew enters a company route in the CPNY RTE entry field
  - A received company or ATC flight plan is inserted.

After the flight crew manually enters a FROM/TO city-pair, the ROUTE SELECTION page appears, if there is at least one company route that is associated with the entered FROM/TO city-pair.
For information about the ROUTE SELECTION page, *Refer to DSC-22-FMS-20-20-20 ROUTE SELECTION Page*.

CAUTION	Entering the FROM/TO city-pair creates a new flight plan, and deletes the current flight plan, if any.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 AIRPORT (ARPT).

L12

Note: *If the format is correct but the entered airport is not in the navigation database, the PILOT STORED RWYs panel of the DATA/AIRPORT page appears. Via the PILOT STORED RWYs panel, the flight crew can add the entered airport to the pilots-stored elements database.*
For more information about the DATA/AIRPORT page, Refer to DSC-22-FMS-20-20-20 DATA/AIRPORT Page.
For information about the pilot-stored elements database, Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database.

L2

LIMITATIONS

The flight crew cannot enter the FROM/TO city-pair on the ACTIVE/INIT page, when:
- The aircraft is not in the PREFLIGHT flight phase, or
- There is a temporary flight plan.

The flight crew cannot clear the FROM/TO entry fields.

Ident.: DSC-22-FMS-20-20-20-230-00004035.0001001 / 14 APR 14

ALTN ENTRY FIELD

Indicates the ident of the alternate airport.
The ALTN entry field must not be empty.

The ident of the alternate airport is:
- Manually entered by the flight crew, or
- Automatically entered, when one of the following occurs:
  - The flight crew enters a company route in the CPNY RTE entry field, and an alternate airport is associated with the entered company route
  - A received company or ATC flight plan is inserted, and an alternate airport is associated with the route of the received flight plan.

After the flight crew manually enters an alternate airport, the ROUTE SELECTION page appears, if there is at least one company route that is associated with the entered alternate and destination airports.
The alternate airport can also be selected via the ALTERNATE page (Refer to page).

Note: *1. The FMS automatically synchronizes the ALTN entry field of the ACTIVE/INIT page and the SELECTED area of the ACTIVE/ALTERNATE page (Refer to page).*
2. The FMS automatically synchronizes the ALTN entry field of the SEC1(2)(3)/INIT page and the SELECTED area of the SEC1(2)(3)/ALTERNATE page (Refer to page).

CAUTION	After an alternate airport is entered, the FMS creates a new alternate flight plan, and deletes the current alternate flight plan, if any.

The ALTN entry field displays the alternate airport that is associated with the defined destination airport. If the defined destination airport has no associated alternate airport, the ALTN entry field displays NONE.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ALTN.

L12

Note: *If the format is correct but the entered airport is not in the navigation database, the PILOT STORED RWYs panel of the DATA/AIRPORT page appears. Via the PILOT STORED RWYs panel, the flight crew can add the entered airport to the pilots-stored elements database.*
For more information about the DATA/AIRPORT page, Refer to DSC-22-FMS-20-20-20 DATA/AIRPORT Page.
For information about the pilot-stored elements database, Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database.

Ident.: DSC-22-FMS-20-20-20-230-00004036.0001001 / 14 APR 14

CPNY RTE ENTRY FIELD

Indicates the company route.
The company route is mandatory, if there is no defined FROM/TO city-pair.

The company route is:
- Manually entered by the flight crew, or
- Automatically entered, when the flight crew selects a company route on the ROUTE SELECTION page (*Refer to page*).

CAUTION	Entering the company route creates a new flight plan, and deletes the current flight plan, if any.

If a FROM/TO city-pair is defined and no company route is selected, the CPNY RTE entry field displays NONE.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 CPNY RTE.

L2

LIMITATIONS

The flight crew cannot enter the company route on the ACTIVE/INIT page, when:
- The aircraft is not in the PREFLIGHT flight phase, or
- There is a temporary flight plan.

The flight crew cannot clear the CPNY RTE entry field.

Ident.: DSC-22-FMS-20-20-20-230-00004037.0001001 / 14 APR 14

ALTN RTE ENTRY FIELD

Indicates the company alternate route.

The company alternate route is:
- Manually entered by the flight crew, or
- Automatically entered, when the flight crew selects an company alternate route on the ROUTE SELECTION page (*Refer to page*).

The company alternate route can also be selected via the ALTERNATE page (*Refer to page*).

Note: *1. The FMS automatically synchronizes the ALTN RTE entry field of the ACTIVE/INIT page and the SELECTED area of the ACTIVE/ALTERNATE page (Refer to page).*
2. The FMS automatically synchronizes the ALTN RTE entry field of the SEC1(2)(3)/INIT page and the SELECTED area of the SEC1(2)(3)/ALTERNATE page (Refer to page).

CAUTION	After a company alternate route is entered, the FMS creates a new alternate flight plan, and deletes the current alternate flight plan, if any.

If a destination airport is defined and no company alternate route is selected, the ALTN RTE entry field displays NONE.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ALTN RTE.

L2

LIMITATIONS

The flight crew cannot enter the company alternate route on the ACTIVE/INIT page, when:
- No destination airport is defined, or
- There is a temporary flight plan.

The flight crew cannot clear the ALTN RTE entry field.

Ident.: DSC-22-FMS-20-20-20-230-00004038.0001001 / 22 APR 14

RTE SEL BUTTON

When clicked, displays the ROUTE SELECTION page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004039.0001001 / 14 APR 14

ALTN RTE SEL BUTTON

When clicked, displays the ROUTE SELECTION page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004040.0001001 / 14 APR 14

CRZ FL ENTRY FIELD

Indicates the cruise flight level.

The CRZ FL entry field must not be empty.

The cruise flight level is:
- Manually entered by the flight crew, or
- Automatically entered, when one of the following occurs:
  - The flight crew enters a company route in the CPNY RTE entry field, and a cruise flight level is associated with the entered company route
  - A received company or ATC flight plan is inserted, and a cruise flight level is associated with the route of the inserted flight plan.

Note: *1. The FMS automatically synchronizes the CRZ FL entry field of the ACTIVE/INIT page and the CRZ entry field of the ACTIVE/PERF page (Refer to page).*
2. The FMS automatically synchronizes the CRZ FL entry field of the SEC1(2)(3)/INIT page and the CRZ entry field of the SEC1(2)(3)/PERF page (Refer to page).

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 CRZ FL.

AUTOMATIC UPDATE

L2 If no cruise FL is defined and the T.O flight phase becomes active, the cruise flight level is automatically set to the highest of the following two values:
- The AFS CP altitude
- The highest climb altitude constraint in the destination flight plan.

L1 If the flight crew sets the AFS CP selected altitude above the cruise flight level , the cruise flight level is set to the AFS CP selected altitude.
If the flight crew enters a cruise flight level that is below the AFS CP selected altitude, the entry is rejected, and the cruise flight level is set to the AFS CP selected altitude.
The CRZ FL entry field displays dashes, when the DES or APPR flight phase becomes active.

L2 **LIMITATIONS**

The flight crew cannot enter the cruise flight level on the ACTIVE/INIT page, when no FROM/TO city-pair is defined.
The flight crew cannot clear the CRZ FL entry field.

Ident.: DSC-22-FMS-20-20-20-230-00004041.0001001 / 14 APR 14

CRZ TEMP ENTRY FIELD

Indicates the cruise temperature.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 CRZ TEMP.

DEFAULT VALUE

When a cruise flight level is entered, or if the CRZ TEMP entry field is cleared, the cruise temperature is set to the ISA temperature.

AUTOMATIC UPDATE

The FMS automatically updates the cruise temperature, if the cruise flight level changes.

L2

LIMITATIONS

The flight crew can not enter the cruise temperature on the ACTIVE/INIT page, when no cruise flight level is defined.

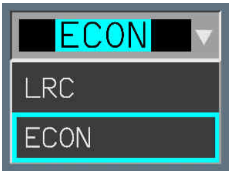
Ident.: DSC-22-FMS-20-20-20-230-00004053.0001001 / 02 OCT 14

MODE LIST

Indicates the FMS speed mode.
The flight crew selects the FMS speed mode from the MODE list.

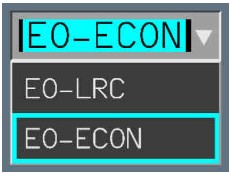
The MODE list has the following options:
- LRC: The FMS computes the optimum speed/Mach that corresponds to the Long Range Cruise (LRC)
  In LRC mode, the optimum speed/Mach is referred to as the LRC speed.
- ECON: The FMS computes the optimum speed/Mach based on the CI value that is entered in the CI entry field.
  In ECON mode, the optimum speed/Mach is referred to as the ECON speed.

MODE List



If the EO mode is active, the MODE list has the following options:
- EO-LRC: The FMS computes the optimum speed/Mach that corresponds to the Long Range Cruise (LRC)
  In EO-LRC mode, the FMS takes the engine failure into account to compute the optimum speed/Mach. The optimum speed/Mach is referred to as the EO-LRC speed.
- EO-ECON: The FMS computes the optimum speed/Mach based on the CI value that is entered in the CI entry field.
  In EO-ECON mode, the FMS takes the engine failure into account to compute the optimum speed/Mach. The optimum speed/Mach is referred to as the EO-ECON speed.

MODE List in EO Mode



Note: *1. The FMS automatically synchronizes all of the following:*
- *The MODE list of the ACTIVE/INIT page*
- *The MODE list of the ACTIVE/FUEL&LOAD page (Refer to page)*
- *The MODE list of the CLB, CRZ, and DES panels of the ACTIVE/PERF page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The MODE list of the SEC1(2)(3)/INIT page*
- *The MODE list of the SEC1(2)(3)/FUEL&LOAD page (Refer to page)*
- *The MODE list of the CLB, CRZ, and DES panels of the SEC1(2)(3)/PERF page (Refer to page).*

For more information about the FMS speed mode, *Refer to DSC-22-FMS-10-50-20 FMS Speed Mode (ECON/LRC)*.

DEFAULT SELECTION

At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
- Selects the LRC mode
- Sets the CI value to 0.

LIMITATIONS

The flight crew cannot change the FMS speed mode, when the DES, APPR, GA, or DONE flight phase is active.

Ident.: DSC-22-FMS-20-20-20-230-00004042.0001001 / 30 APR 14

CI ENTRY FIELD

Indicates the Cost Index (CI).
The CI entry field must not be empty.

The CI value is:

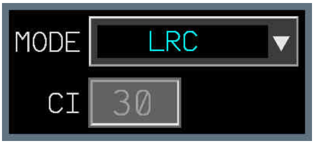
- Manually entered by the flight crew, or
- Automatically entered, if one of the following occurs:
  - The flight crew enters a company route in the CPNY RTE entry field, and a CI is associated with the entered company route
  - A received company or ATC flight plan is inserted, and a CI is associated with the route of the received flight plan.

Note: *1. The FMS automatically synchronizes all of the following:*
- *The CI entry field of the ACTIVE/INIT page*
- *The CI entry field of the ACTIVE/FUEL&LOAD page (Refer to page)*
- *The CI entry field of the CLB, CRZ, and DES panels of the ACTIVE/PERF page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The CI entry field of the SEC1(2)(3)/INIT page*
- *The CI entry field of the SEC1(2)(3)/FUEL&LOAD page (Refer to page)*
- *The CI entry field of the CLB, CRZ, and DES panels of the SEC1(2)(3)/PERF page (Refer to page).*

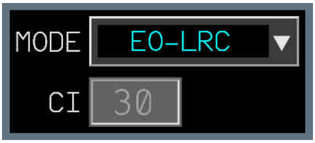
If the FMS speed mode is LRC, the CI entry field still displays the CI value that is associated with the ECON mode, but the flight crew cannot change the CI value.

CI Entry Field in LRC Mode



If the FMS speed mode is EO-LRC, the CI entry field still displays the CI value that is associated with the EO-ECON mode, but the flight crew cannot change the CI value.

CI Entry Field in EO-LRC Mode



For more information about the CI, *Refer to DSC-22-FMS-10-50-20 FMS Speed Mode (ECON/LRC)*.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 COST INDEX (CI).

DEFAULT VALUE

At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
- Selects the LRC mode
- Sets the CI value to 0.

LIMITATIONS

The CI cannot be changed, when the DES, APPR, or GA flight phase is active.

Ident.: DSC-22-FMS-20-20-20-230-00004043.0001001 / 22 APR 14

TROPO ENTRY FIELD

Indicates the tropopause altitude.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 TROPO.

DEFAULT VALUE

The default tropopause altitude is 36 090 ft.

Ident.: DSC-22-FMS-20-20-20-230-00004044.0001001 / 22 APR 14

TRIP WIND ENTRY FIELD

Indicates the trip wind.

L2 The trip wind is the average effective wind for the trip from the departure airport to the destination airport.

L1 The flight crew manually enters the trip wind.
When the flight crew enters any of the climb, cruise, or descent winds on the WIND page, the FMS does no longer use the trip wind value. In this case, the TRIP WIND entry field displays dashes, and the flight crew cannot enter a value in the TRIP WIND entry field.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 TRIP WIND

DEFAULT VALUE

The default value of the trip wind is HD000.

L2 **LIMITATIONS**

The flight crew cannot enter the trip wind, when no FROM/TO city-pair is defined.

Ident.: DSC-22-FMS-20-20-20-230-00004045.0001001 / 22 APR 14

WIND BUTTON

When clicked, displays the WIND page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004046.0001001 / 22 APR 14

IRS BUTTON

When clicked, displays the POSITION/IRS page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004047.0001001 / 22 APR 14

DEPARTURE BUTTON

When clicked, displays the DEPARTURE page (*Refer to page*).

The DEPARTURE button is available, only when all of the following apply:
- The active flight phase is PREFLIGHT
- A departure airport is defined.

Ident.: DSC-22-FMS-20-20-20-230-00004049.0001001 / 22 APR 14

NAVAIDS BUTTON

When clicked, displays the POSITION/NAVAIDS page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004050.0001001 / 22 APR 14

FUEL&LOAD BUTTON

When clicked, displays the FUEL&LOAD page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004051.0001001 / 22 APR 14

T.O PERF BUTTON

When clicked, displays the T.O panel of the PERF page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004048.0001001 / 22 APR 14

RTE SUMMARY BUTTON

When clicked, displays the DATA/ROUTE page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-230-00004052.0001001 / 14 APR 14

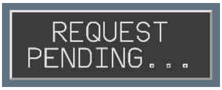
CPNY F-PLN REQUEST BUTTON

When clicked, displays the COMPANY F-PLN REQUEST page (*Refer to page*).

L2 The CPNY F-PLN REQUEST button is available, only when all of the following apply:
- Before engine start
- No active flight plan is defined
- No request for a secondary flight plan is in progress.

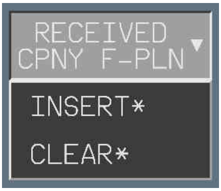
L1 When a request for an active flight plan is in progress, the button label is REQUEST PENDING... . When clicked, still displays the COMPANY F-PLN REQUEST page.

REQUEST PENDING...



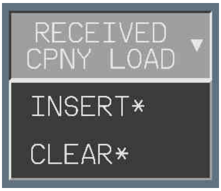
When an active company flight plan is received, the button label is RECEIVED CPNY F-PLN . When clicked, opens a menu that enables the flight crew to insert or clear the received company flight plan.

RECEIVED CPNY F-PLN



When the received company message contains only the flight plan load data, and not the flight plan itself, the button label is RECEIVED CPNY LOAD. When clicked, opens a menu that enables the flight crew to insert or clear the received company load data.

RECEIVED CPNY LOAD



Ident.: DSC-22-FMS-20-20-20-230-00004054.0001001 / 14 APR 14

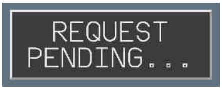
CPNY WIND REQUEST BUTTON

When clicked:

- If the free text AMI option is not activated, sends a company wind request to the company ground station (via ACARS)
- If the free text AMI option is activated, displays the COMPANY WIND DATA REQUEST page (*Refer to page*).
  On the COMPANY WIND DATA REQUEST page, the flight crew can enter free text that will be sent with the wind request.

When a request for an active wind is in progress, the button label is REQUEST PENDING... . When clicked, still displays the COMPANY WIND DATA REQUEST page.

REQUEST PENDING...



Ident.: DSC-22-FMS-20-20-20-230-00004056.0001001 / 14 APR 14

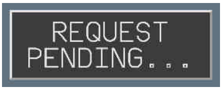
CPNY T.O REQUEST BUTTON

When clicked, displays the COMPANY T.O DATA REQUEST page (*Refer to page*).

L2 The CPNY T.O REQUEST button is available, only when the flight phase is PREFLIGHT or DONE.

L1 When a request for active takeoff data is in progress, the button label is REQUEST PENDING... . When clicked, still displays the COMPANY T.O DATA REQUEST page.

REQUEST PENDING...



When the active company takeoff data is received, the button label is RECEIVED CPNY T.O. When clicked, displays the RECEIVED CPNY T.O DATA page (*Refer to page*).

RECEIVED CPNY T.O

MSG LIST

Ident.: DSC-22-FMS-20-20-20-240-00004063.0001001 / 22 APR 14

START WPT LIST

Indicates the first waypoint along the flight plan that the FMS uses to compute the series of latitude/longitude crossing points.
The flight crew enters the start waypoint via the keyboard, or by selecting the start waypoint from the START WPT list.

The start waypoint can be defined between the origin and:
- The last en-route waypoint (excluded), or
- The waypoint that is associated with the first descent constraint in the destination flight plan (excluded).

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

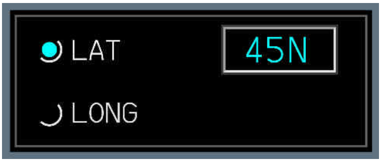
Ident.: DSC-22-FMS-20-20-20-240-00004064.0001001 / 22 APR 14

LAT/LONG OPTION LIST

The flight crew selects the parameter that defines the crossing points, by selecting one of the following options:

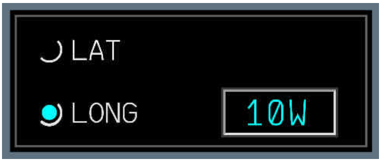
- LAT: Each crossing point is an intersection with a latitude
  LAT is the default-selected option.
  When selected, displays the LAT entry field.
  The LAT entry field indicates the origin latitude value.
  The default value of the origin latitude is the rounded latitude of the flight plan waypoint that follows the first waypoint of the START WPT list. If the FMS does not find a latitude that corresponds to this flight plan waypoint, the default value is the rounded latitude of the first waypoint of the START WPT list.
  The flight crew can overwrite the default value.
  If the flight crew clears the default value or the manually-entered value, the LAT entry field disappears, and the LAT option is deselected.

LAT Entry Field



- LONG: Each crossing point is an intersection with a longitude.
  When selected, displays the LONG entry field.
  The LONG entry field indicates the origin longitude value.
  The default value of the origin longitude is the rounded longitude of the flight plan waypoint that follows the first waypoint of the START WPT list. If the FMS does not find a longitude that corresponds to this flight plan waypoint, the default value is the rounded longitude of the first waypoint of the START WPT list.
  The flight crew can overwrite the default value.
  If the flight crew clears the default value or the manually-entered value, the LONG entry field disappears, and the LONG option is deselected.

LONG Entry Field



ENTRY FORMAT

For the entry format of:
- Origin latitude, *Refer to DSC-22-FMS-20-80 LAT (LL XING)*
- Origin longitude, *Refer to DSC-22-FMS-20-80 LONG (LL XING)*.

Ident.: DSC-22-FMS-20-20-20-240-00004065.0001001 / 22 APR 14

INCREMENT ENTRY FIELD

The flight crew enters the increment between the crossing latitudes(longitudes).
The default value is 1.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 INCREMENT.

Ident.: DSC-22-FMS-20-20-20-240-00004066.0001001 / 22 APR 14

NUMBER ENTRY FIELD

The flight crew enters the maximum desired number of intersections.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 NUMBER.

Ident.: DSC-22-FMS-20-20-20-240-00004067.0001001 / 22 APR 14

INSERT AS WPT BUTTON

When clicked, inserts the intersections as waypoints in the temporary flight plan.

Ident.: DSC-22-FMS-20-20-20-240-00004071.0001001 / 22 APR 14

TMPY F-PLN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).

L2 The TMPY F-PLN button is displayed, only if there is a temporary flight plan. If there is no temporary flight plan, the RETURN button is displayed instead of the TMPY F-PLN button. When the flight crew clicks on the RETURN button, the F-PLN page appears.

MSG LIST

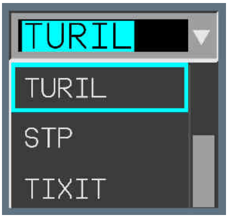
Ident.: DSC-22-FMS-20-20-20-260-00004075.0001001 / 22 APR 14

START WPT LIST

Indicates the offset start waypoint.
The flight crew enters the offset start waypoint via the keyboard, or by selecting the offset start waypoint from the START WPT list.
The START WPT list displays all flight plan waypoints from the aircraft present position to the destination airport.
Some flight plan waypoints cannot be part of the offset segment (e.g. a holding fix). These waypoints are not displayed in the START WPT list.

Start Waypoint List



The default start waypoint is:
- The revised waypoint, if there is no offset segment in the flight plan

  Note: *1. If the revised waypoint is the FROM waypoint, the default start waypoint is P.POS.*
  2. If the revised waypoint cannot be part of an offset segment (e.g. a holding fix), the default start waypoint is the first valid flight plan waypoint down-path the revised waypoint.

- The start waypoint of the offset segment, if there is an offset segment in the flight plan
- P.POS, if the aircraft currently flies the offset segment.
  In this case, the flight crew cannot change the start waypoint.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

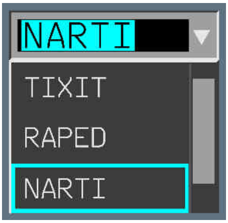
Ident.: DSC-22-FMS-20-20-20-260-00004076.0001001 / 22 APR 14

END WPT LIST

Indicates the offset end waypoint.
The flight crew enters the offset end waypoint via the keyboard, or by selecting offset end waypoint from END WPT the list.
The END WPT list displays all flight plan waypoints from the selected start waypoint to the destination airport.

Some flight plan waypoints cannot be part of the offset segment (e.g. a holding fix). The END WPT list displays only the flight plan waypoints between the selected start waypoint and the first not valid waypoint.

END WPT List



The default end waypoint is:
- The last waypoint of the flight plan before the destination airport, or the last waypoint before the first not-valid waypoint, if there is no offset segment in the flight plan
- The end waypoint of the offset segment, if there is an offset segment in the flight plan.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

Ident.: DSC-22-FMS-20-20-20-260-00004077.0001001 / 22 APR 14

OFFSET DIST ENTRY FIELD

Indicates the lateral offset distance.
The flight crew can enter the offset side (L or R) with the offset distance (e.g. 15L or L15).
After validation of the entry, the OFFSET DIST entry field displays only the offset distance, and the offset side option list (*Refer to Offset Side Option List*) is automatically updated.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 OFFSET DIST.

Ident.: DSC-22-FMS-20-20-20-260-00004078.0001001 / 22 APR 14

OFFSET SIDE OPTION LIST

The flight crew selects the offset side, by selecting one of the following options:
- LEFT
- RIGHT.

Ident.: DSC-22-FMS-20-20-20-260-00004079.0001001 / 22 APR 14

INTERCEPT ANGLE ENTRY FIELD

Indicates the angle between the original flight plan and the transition trajectory from the original flight plan to the offset path (or vice versa).
The default intercept angle is 30 °. The Operator can change this default value via the AMI file.
The flight crew can overwrite the default value.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 INTERCEPT ANGLE.

Ident.: DSC-22-FMS-20-20-20-260-00004080.0001001 / 14 APR 14

CANCEL OFFSET BUTTON

When clicked, cancels the offset segment in the temporary flight plan, and displays the F-PLN page (*Refer to page*).
L2 The flight crew can also cancel the offset segment by entering 0 in the OFFSET DIST entry field (*Refer to OFFSET DIST Entry Field*).

Ident.: DSC-22-FMS-20-20-20-260-00004081.0001001 / 22 APR 14

TMPY F-PLN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).
L2 The TMPY F-PLN button is displayed, only if there is a temporary flight plan. If there is no temporary flight plan, the RETURN button is displayed instead of the TMPY F-PLN button. When the flight crew clicks on the RETURN button, the F-PLN page appears.

PURPOSE

On the PERF page, the flight crew can:
- Change the cruise flight level
- Display the optimum flight level, the recommended maximum flight level, and the engine-out maximum flight level

- Display, change, or complete the performance data for the following FMS flight phases: T.O, CLB, CRZ, DES, APPR, and GA
- Change the FMS speed mode (ECON/LRC)
- Change the cost index that is associated with the ECON mode
- Activate the APPR phase
- Clear the Engine-Out (EO) mode.

The PERF page is available for the active and secondary flight plans.

LINKS

For information about the:
- Performance computation, *Refer to DSC-22-FMS-10-50-10 Overview*
- EO mode, *Refer to DSC-22-FMS-10-60 General*.

Ident.: DSC-22-FMS-20-20-20-270-00004083.0001001 / 14 APR 14

ACCESS

The flight crew can access:

- The ACTIVE/PERF page via:
  - The KCCU, by pressing the PERF key
    The panel (T.O, CLB, CRZ, DES, APPR, or GA panel) that opens by default is the panel that corresponds to the active flight phase.

CRZ ENTRY FIELD

Indicates the cruise flight level.

Note: *1. The FMS automatically synchronizes the CRZ entry field of the ACTIVE/PERF page and the CRZ FL entry field of the ACTIVE/INIT page (Refer to DSC-22-FMS-20-20-20 INIT Page).*
2. The FMS automatically synchronizes the CRZ entry field of the SEC1(2)(3)/PERF page and the CRZ FL entry field of the SEC1(2)(3)/INIT page (Refer to DSC-22-FMS-20-20-20 INIT Page).

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 CRZ FL.

AUTOMATIC UPDATE

L2 If no cruise FL is defined and the T.O flight phase becomes active, the cruise flight level is automatically set to the highest of the following two values:
- The AFS CP altitude
- The highest climb altitude constraint in the destination flight plan.

L1 If the flight crew sets the AFS CP selected altitude above the cruise flight level , the cruise flight level is set to the AFS CP selected altitude.
If the flight crew enters a cruise flight level that is below the AFS CP selected altitude, the entry is rejected, and the cruise flight level is set to the AFS CP selected altitude.
The CRZ entry field displays dashes, when the DES or APPR flight phase becomes active.

Ident.: DSC-22-FMS-20-20-20-270-00004085.0001001 / 22 APR 14
Impacted by TDU: 00024902 OPT

OPT

Indicates the current Optimum Flight Level (OPT FL)
For information about the computation of the OPT FL, *Refer to DSC-22-FMS-10-50-50 Optimum Flight Level (OPT FL)*.

L2 Dashes appear instead of the value:
- In DES and APPR flight phases, or
- In engine-out situation.

Ident.: TDU / DSC-22-FMS-20-20-20-270-00024902.0001001 / 03 JUL 20
Impacted DU: 00004085 OPT

1 ## OPT

Indicates the current Optimum Flight Level (OPT FL)
For information about the computation of the OPT FL, *Refer to DSC-22-FMS-10-50-50 Optimum Flight Level (OPT FL)*.

L2 Dashes appear instead of the value:
- In DES and APPR flight phases, or
- In engine-out situation.

L3 The computation of OPT FL and the computation of REC MAX FL are independent. Therefore, the OPT FL may be slightly above the REC MAX FL in some conditions.

L1

OPT FL XXX

Appears instead of the value when both of the following conditions occur:
- The OPT FL is limited by the maximum certified altitude (*Refer to LIM-AG-OPS Environmental Envelope*)
- The REC MAX FL is also limited by the maximum certified altitude.

Ident.: DSC-22-FMS-20-20-20-270-00004166.0001001 / 22 APR 14

REC MAX

Indicates the current Recommended Maximum Flight Level (REC MAX FL).
For information about the computation of the REC MAX FL, *Refer to DSC-22-FMS-10-50-50 Recommended Maximum Flight Level (REC MAX FL)*.

Ident.: DSC-22-FMS-20-20-20-270-00004086.0001001 / 22 APR 14

EO MAX

Indicates the current LRC Engine-Out Maximum Flight Level (LRC EO MAX FL).
The color of the EO MAX label depends on the engine state.

EO MAX FL 340

Both engines are operative.

EO MAX FL 340

One engine is failed.

For information about the computation of the LRC EO MAX FL, *Refer to DSC-22-FMS-10-60 LRC Engine-Out Maximum Flight Level (LRC EO MAX FL)*.

Note: *The LRC EO MAX FL is not displayed on the SEC/PERF page.*

Ident.: DSC-22-FMS-20-20-20-270-00004091.0001001 / 14 APR 14

ACTIVE FLIGHT PHASE

The label of the panel tab is displayed in green, when the corresponding flight phase is active.
For more information about the FMS flight phases, *Refer to DSC-22-FMS-10-50-30 Overview*.

Ident.: DSC-22-FMS-20-20-20-270-00004087.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the INIT page (*Refer to page*).

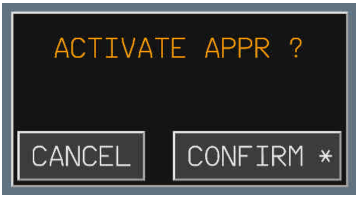
L2 The RETURN button appears, only if the flight crew accesses the PERF page via the ACTIVE/INIT page.

Ident.: DSC-22-FMS-20-20-20-270-00004089.0001001 / 14 APR 14

ACTIVATE APPR BUTTON

When clicked, activates the APPR flight phase.
The flight crew must perform a confirmation action.

Confirmation Window



ACTIVATE APPR ?

The flight crew can activate the APPR flight phase by using the ACTIVATE APPR button during the CLB, CRZ, DES, and GA flight phases.
In the other flight phases, the ACTIVATE APPR button is not displayed.

Ident.: DSC-22-FMS-20-20-20-270-00004088.0001001 / 22 APR 14

POS MONITOR BUTTON

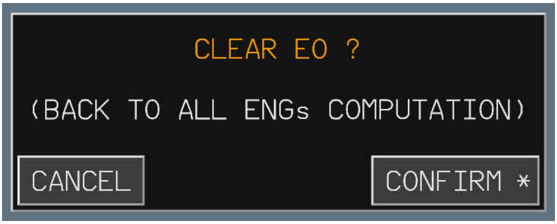
When clicked, displays the POSITION/MONITOR page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-270-00004090.0001001 / 14 APR 14

CLEAR EO BUTTON

When clicked, deactivates the EO mode of the FMS.
The flight crew must perform a confirmation action.

Confirmation Window



CLEAR EO ?

(BACK TO ALL ENGs COMPUTATION)

Ident.: DSC-22-FMS-20-20-20-270-00004093.0001001 / 22 APR 14

RWY

Indicates the takeoff runway of the flight plan.

Ident.: DSC-22-FMS-20-20-20-270-00004099.0001001 / 22 APR 14

T.O SHIFT ENTRY FIELD

Indicates the runway takeoff shift.
The runway takeoff shift is the distance between the runway threshold, and the position at which the flight crew releases the aircraft brakes in order to take off.
If the navigation mode is not IRS/GNSS, the aircraft position is updated (at takeoff) as follows: The aircraft position is the position of the runway threshold plus the entered takeoff shift.

L2 The takeoff shift value is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 T.O SHIFT.

Ident.: DSC-22-FMS-20-20-20-270-00004094.0001001 / 13 JAN 15

V1, VR, AND V2 ENTRY FIELDS

Indicate the takeoff speeds: V1, VR, and V2.

For the definition of:
- V1, *Refer to DSC-22-27-10-20 V1*
- VR,*Refer to DSC-22-27-10-20 VR*
- V2, *Refer to DSC-22-27-10-20 V2*.

The V1, V2, and VR entry fields must not be empty.
The flight crew manually enters the takeoff speed values.

Note: *1. If the flight crew does not enter one or more of the takeoff speed values, the ECAM triggers the T.O SPEEDS NOT INSERTED alert, when:*
- *The flight crew presses the T.O CONFIG pb of the ECP, or*
- *The engines are set to takeoff power.*

2. If the flight crew does not enter V2, the SRS mode will not be available at takeoff.

L2 The takeoff speed values are automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).

L1 The FMS message area displays the V1/VR/V2 DISAGREE message (*Refer to message*), if the inserted V1, VR, and V2 do not satisfy the condition V1 ≤ VR ≤ V2.

The FMS message area displays the T.O SPEED TOO LOW CHECK TOW & T.O DATA message (*Refer to message*), if the inserted V1, VR, and V2 do not satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G).

If the flight crew already entered the takeoff speeds, and then changes the takeoff runway, the takeoff speeds need to be confirmed again, or changed if necessary:

- The FMS message area displays the CHECK T.O DATA message (*Refer to message*) to alert the flight crew
- The old takeoff speeds are displayed in yellow next to the entry fields. The flight crew can accept these speeds by clicking on the CONFIRM T.O SPDs button. If the takeoff speeds changed, the flight crew enters the new values in the entry fields.

CLEAR INFO   CHECK T.O DATA

L2 The old takeoff speeds are not cleared, but the CHECK T.O DATA message (*Refer to message*) is displayed, if one of the following occurs:

- The flight crew already entered the takeoff speeds, and then changes the flaps setting or takeoff shift
- The flight crew activates a secondary flight plan (in preflight).

L1 ENTRY FORMAT

For the entry format of:

- V1, *Refer to DSC-22-FMS-20-80 V1*
- VR, *Refer to DSC-22-FMS-20-80 VR*
- V2, *Refer to DSC-22-FMS-20-80 V2*.

Ident.: DSC-22-FMS-20-20-20-270-00004095.0001001 / 22 APR 14

F, S, AND GDOT [T.O]

Indicate the following operating speeds for takeoff: F, S, and GDOT.

Note: *The FMS uses estimated weight and CG to compute the operating speeds that are displayed on the T.O panel of the PERF page. The PRIMs use the current weight and CG to compute the operating speeds that are displayed on the PFD. Therefore, the operating speeds that are displayed on the PFD may be different from the operating speeds that are displayed on the T.O panel of the PERF page.*

For more information about the operating speeds that the FMS computes for takeoff, *Refer to DSC-22-FMS-10-50-30 T.O*.

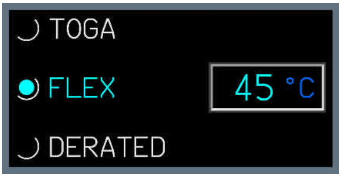
Ident.: DSC-22-FMS-20-20-20-270-00004096.0001001 / 03 OCT 14

T.O THRUST OPTION LIST

To select the desired takeoff thrust, the flight crew selects one of the following options:

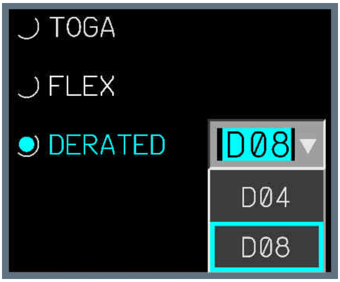
- TOGA, for TOGA thrust
- FLEX, for FLX thrust
  When selected, displays the FLEX entry field. The flight crew enters the FLEX temperature in the FLEX entry field.

FLEX Entry Field



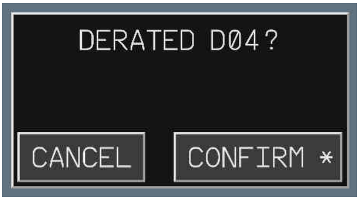
- DERATED, for DTO thrust.
  When selected, displays the DERATED list. The list can have a maximum of 9 derated thrust levels. The number of available thrust levels depends on the engine type.
  The flight crew enters the derated thrust level via the keyboard, or by selecting the derated thrust level from the DERATED list.

DERATED Entry Field



The flight crew must perform a confirmation action.

Confirmation Window



L2 The takeoff thrust is automatically selected, if the flight crew inserts received company takeoff data via the RECEIVED T.O COMPANY DATA page (*Refer to page*).

L1 **ENTRY FORMAT**

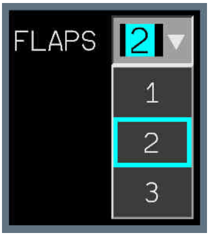
For the entry format of:
- FLEX temperature, *Refer to DSC-22-FMS-20-80 FLEX*
- Derated thrust level, *Refer to DSC-22-FMS-20-80 DERATED T.O*.

Ident.: DSC-22-FMS-20-20-20-270-00004097.0001001 / 22 APR 14

FLAPS LIST

Indicates the flaps setting for takeoff.
The flight crew enters the flaps setting via the keyboard, or by selecting the flaps setting from the FLAPS list.

FLAPS List



L2 The flaps setting is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED T.O COMPANY DATA page (*Refer to page*).

L1 The ECAM triggers the F/CTL T.O FLAPS/FMS DISAGREE alert (*Refer to procedure*), if all of the following occur:
- The current position of the FLAPS lever differs from the value that is entered in the entry field of the FLAPS list on the T.O panel of the PERF page
- The flight crew presses the T.O CONFIG pb of the ECP.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 FLAPS.

Ident.: DSC-22-FMS-20-20-20-270-00004098.0001001 / 22 APR 14

THS FOR ENTRY FIELD

Indicates the aircraft takeoff CG.
The THS FOR entry field must not be empty.
In the THS FOR entry field, the flight crew enters the CG value that the loadsheet indicates.
The FMS sends this value of the aircraft takeoff CG to the FWS for the takeoff trim check. If the takeoff trim check fails, the ECAM triggers the F/CTL PITCH TRIM/FMS/CG DISAGREE alert (*Refer to procedure*).

L2 The value of the aircraft takeoff CG is cleared and the THS FOR entry field displays amber boxes, if the flight crew inserts received company takeoff data via the RECEIVED T.O COMPANY DATA page (*Refer to page*). The flight crew needs to enter the value of the aircraft takeoff CG again.

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 THS.

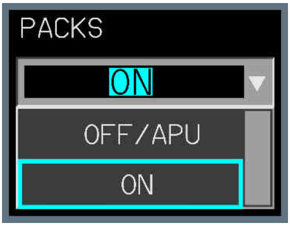
Ident.: DSC-22-FMS-20-20-20-270-00004438.0001001 / 22 APR 14

PACKS LIST

Indicates the pack setting for takeoff.
The flight crew selects the desired pack setting from the PACKS list.

The PACKS list has the following options:
- OFF/APU : The packs are off, or the APU bleed supplies the packs
- ON: The packs are on, and the engine bleed supplies the packs.

PACKS List



After engine start, if the flight crew modifies the pack setting via the PACKS list on the T.O panel of the PERF page, the FMS message area displays the CHECK T.O DATA message (*Refer to message*).

L2 The pack setting on the T.O panel of the PERF page is not used by the FMS to compute the flight plan predictions.

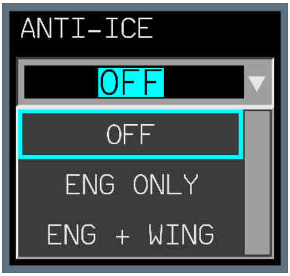
Ident.: DSC-22-FMS-20-20-20-270-00003623.0001001 / 14 APR 14

ANTI-ICE LIST

Indicates the anti-ice setting for takeoff.
The flight crew selects the desired anti-ice setting from the ANTI-ICE list.

The ANTI-ICE list has the following options:
- OFF : The anti-ice system is off
- ENG ONLY: Only the engine anti-ice is on
- ENG + WING: Both engine and wing anti-ice are on.

ANTI-ICE List



After engine start, if the flight crew modifies the anti-ice setting via the ANTI-ICE list on the T.O panel of the PERF page, the FMS message area displays the CHECK T.O DATA message (*Refer to message*).

L2 The anti-ice setting on the T.O panel of the PERF page is not used by:
- The FMS to compute the flight plan predictions
- The XCHECK WITH AVNCS function to crosscheck the setting of the packs with the OIS takeoff performance application.

Ident.: DSC-22-FMS-20-20-20-270-00004100.0001001 / 22 APR 14

THR RED ENTRY FIELD [T.O/CLB]

Indicates the thrust reduction altitude.
The thrust reduction altitude is the altitude at which the flight crew should reduce the thrust from TOGA, FLX, or DTO, to CLB or DCLB.

Note: 1. *The FMS automatically synchronizes the THR RED entry field of the T.O panel of the ACTIVE/PERF page, and the THR RED entry field of the CLB panel ACTIVE/PERF page.*
2. *The FMS automatically synchronizes the THR RED entry field of the T.O panel of the SEC1(2)(3)/PERF page, and the THR RED entry field of the CLB panel of the SEC1(2)(3)/PERF page.*

DEFAULT VALUE

The default value for the thrust reduction altitude is:
- The value that is associated with the departure airport, and that is stored in the navigation database, or
- The value that is the sum of:
  - The departure airport elevation (stored in the navigation database)
  - The thrust reduction height (defined by the Operator in the AMI file). The default value for the thrust reduction height is 1 500 ft.

The flight crew can always overwrite the default value.

L2 The thrust reduction altitude is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).

AUTOMATIC UPDATE

The FMS considers that the aircraft levels off below the thrust reduction altitude, if all of the following occur:
- The flight crew enters an AT or AT OR BELOW altitude constraint at a waypoint
- This waypoint is a waypoint that is in the T.O or CLB flight phase
- The altitude of this waypoint is below the thrust reduction altitude.

As a result, the altitude of the constraint automatically becomes the new thrust reduction altitude. In this case, the FMS message area displays the NEW THR RED ALT : HHHHH message (*Refer to message*).
During the T.O flight phase, if the flight crew sets the AFS CP selected altitude below the thrust reduction altitude, the AFS CP selected altitude becomes the new thrust reduction altitude.

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 THR RED (ALTITUDE).

Ident.: DSC-22-FMS-20-20-20-270-00004101.0001001 / 14 APR 14

ACCEL ENTRY FIELD [T.O/CLB]

Indicates the acceleration altitude.

The acceleration altitude is the altitude at which the aircraft accelerates toward:
- The initial climb speed, or
- The NOISE speed, if a noise procedure is entered, or
- The preselected speed, if the flight crew entered a speed in the PRESEL entry field on the CLB panel of the PERF page.

At the acceleration altitude, the CLB flight phase becomes active.

Note: *1. The FMS automatically synchronizes the ACCEL entry field of the T.O panel of the ACTIVE/PERF page, and the ACCEL entry field of the CLB panel ACTIVE/PERF page.*
2. The FMS automatically synchronizes the ACCEL entry field of the T.O panel of the SEC1(2)(3)/PERF page, and the ACCEL entry field of the CLB panel of the SEC1(2)(3)/PERF page.

DEFAULT VALUE

The default value for the acceleration altitude is:
- The value that is associated with the departure airport, and that is stored in the navigation database, or
- The value that is the sum of:
  - The departure airport elevation (stored in the navigation database)
  - The acceleration height (defined by the Operator in the AMI file).
    The default value for the acceleration height is 1 500 ft.

The flight crew can always overwrite the default value.
L2 The acceleration altitude is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).

AUTOMATIC UPDATE

The FMS considers that the aircraft levels off below the acceleration altitude, if all of the following occur:
- The flight crew enters an AT or AT OR BELOW altitude constraint at a waypoint
- This waypoint is a waypoint that is in the T.O or CLB flight phase
- The altitude of this waypoint is below the acceleration altitude.

As a result, the altitude of the constraint becomes the new acceleration altitude. In this case, the FMS message area displays the NEW ACC ALT ALT : HHHHH message (*Refer to message*).
During the T.O flight phase, if the flight crew sets the AFS CP selected altitude below the acceleration altitude, the AFS CP selected altitude becomes the new acceleration altitude.

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ACCEL ALT.

Ident.: DSC-22-FMS-20-20-20-270-00004103.0001001 / 22 APR 14

NOISE BUTTON

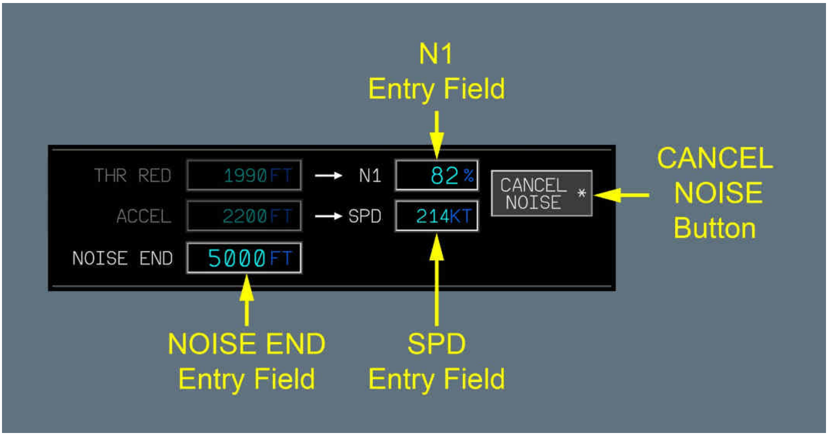
When clicked, displays the NOISE parameters (*Refer to NOISE Parameters*).

Ident.: DSC-22-FMS-20-20-20-270-00004104.0001001 / 22 APR 14

NOISE PARAMETERS

The FMS uses the NOISE parameters to compute the vertical profile of a NOISE procedure.

NOISE Parameters



THR RED 1990FT → N1 82%
ACCEL 2200FT → SPD 214KT
NOISE END 5000FT

NOISE END ENTRY FIELD

Indicates the NOISE END altitude.
The NOISE END altitude is the altitude at which the noise restrictions no longer apply. Below the NOISE END altitude, a speed restriction and a thrust restriction may apply.
L2 The NOISE END altitude is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).
L1 For more information about the NOISE END altitude, *Refer to DSC-22-FMS-10-50-60 NOISE Parameters*.

Entry Format

Refer to DSC-22-FMS-20-80 NOISE END (ALTITUDE).

N1 ENTRY FIELD

Indicates the NOISE thrust.
The NOISE thrust is the thrust target (in percentage of N1) that the A/THR applies between the thrust reduction altitude and the NOISE END altitude.

If the flight crew does not enter the NOISE thrust, the CLB thrust will apply.

L2 The NOISE thrust is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).

L1 For more information about the NOISE thrust, *Refer to DSC-22-FMS-10-50-60 NOISE Parameters*.

Entry Format

Refer to DSC-22-FMS-20-80 N1 (NOISE).

SPD ENTRY FIELD

Indicates the NOISE speed.
The NOISE speed is the managed speed target that applies between the acceleration altitude and the end of the thrust ramp.
When the flight crew enters a NOISE END altitude, the default value of the NOISE speed is automatically entered in the SPD entry field.
The flight crew can always overwrite the default value.

L2 The NOISE speed is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).

L1 For more information about the NOISE speed, *Refer to DSC-22-FMS-10-50-60 NOISE Parameters*.

Entry Format

Refer to DSC-22-FMS-20-80 SPD.

CANCEL NOISE BUTTON

When clicked, cancels the NOISE procedure.

Ident.: DSC-22-FMS-20-20-20-270-00005611.0001001 / 22 APR 14

TRANS ENTRY FIELD [T.O/CLB]

Indicates the climb transition altitude.

Note: *1. The FMS automatically synchronizes the TRANS entry field of the T.O panel of the ACTIVE/PERF page, and the TRANS entry field of the CLB panel ACTIVE/PERF page.*
2. The FMS automatically synchronizes the TRANS entry field of the T.O panel of the SEC1(2)(3)/PERF page, and the TRANS entry field of the CLB panel of the SEC1(2)(3)/PERF page.

DEFAULT VALUE

The default value is the transition altitude that is associated with the departure procedure of the departure airport, and that is stored in the navigation database. If there is no stored transition altitude in the navigation database, the TRANS entry field displays dashes.
The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 TRANS (ALTITUDE).

Ident.: DSC-22-FMS-20-20-20-270-00004102.0001001 / 22 APR 14

EO ACCEL ENTRY FIELD [T.O]

Indicates the engine-out acceleration altitude.
The engine-out acceleration altitude is only a reminder. There is no specific system behavior that is associated with this altitude.

DEFAULT VALUE

The default value for the engine-out acceleration altitude is:

- The value that is associated with the departure airport, and that is stored in the navigation database, or
- The value that is the sum of:
  - The departure airport elevation (stored in the navigation database)
  - The engine-out acceleration height (defined by the Operator in the AMI file).
    The default value of the engine-out acceleration height is 1 500 ft.

The flight crew can always overwrite the default value.

L2 The engine-out acceleration altitude is automatically entered, if the flight crew inserts received company takeoff data via the RECEIVED COMPANY T.O DATA page (*Refer to page*).

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 EO ACCEL (ALTITUDE).

Ident.: DSC-22-FMS-20-20-20-270-00004105.0001001 / 14 APR 14

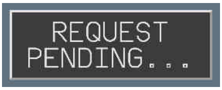
CPNY T.O REQUEST BUTTON

When clicked, displays the COMPANY T.O DATA REQUEST page (*Refer to page*).

L2 The CPNY T.O REQUEST button is available, only when the flight phase is PREFLIGHT or DONE.

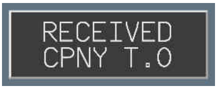
L1 When a request for active takeoff data is in progress, the button label is REQUEST PENDING... . When clicked, still displays the COMPANY T.O DATA REQUEST page.

REQUEST PENDING...



When the active company takeoff data is received, the button label is RECEIVED CPNY T.O. When clicked, displays the RECEIVED CPNY T.O DATA page (*Refer to page*).

RECEIVED CPNY T.O



Ident.: DSC-22-FMS-20-20-20-270-00004397.0001001 / 02 OCT 14

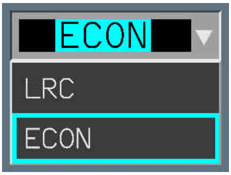
MODE LIST

Indicates the FMS speed mode.
The flight crew selects the FMS speed mode from the MODE list.

The MODE list has the following options:

- LRC: The FMS computes the optimum speed/Mach that corresponds to the Long Range Cruise (LRC)
  In LRC mode, the optimum speed/Mach is referred to as the LRC speed.
- ECON: The FMS computes the optimum speed/Mach based on the CI value that is entered in the CI entry field.
  In ECON mode, the optimum speed/Mach is referred to as the ECON speed.

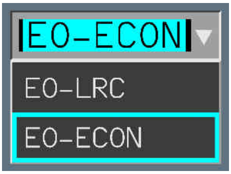
MODE List



If the EO mode is active, the MODE list has the following options:

- EO-LRC: The FMS computes the optimum speed/Mach that corresponds to the Long Range Cruise (LRC)
  In EO-LRC mode, the FMS takes the engine failure into account to compute the optimum speed/Mach. The optimum speed/Mach is referred to as the EO-LRC speed.
- EO-ECON: The FMS computes the optimum speed/Mach based on the CI value that is entered in the CI entry field.
  In EO-ECON mode, the FMS takes the engine failure into account to compute the optimum speed/Mach. The optimum speed/Mach is referred to as the EO-ECON speed.

MODE List in EO Mode



Note: *1. The FMS automatically synchronizes all of the following:*
- *The MODE list of the CLB, CRZ, and DES panels of the ACTIVE/PERF page*
- *The MODE list of the ACTIVE/FUEL&LOAD page (Refer to page)*
- *The MODE list of the ACTIVE/INIT page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The MODE list of the CLB, CRZ, and DES panels of the SEC1(2)(3)/PERF page*
- *The MODE list of the SEC1(2)(3)/FUEL&LOAD page (Refer to page)*
- *The MODE list of the SEC1(2)(3)/INIT page (Refer to page).*

For more information about the FMS speed mode, *Refer to DSC-22-FMS-10-50-20 FMS Speed Mode (ECON/LRC)*.

DEFAULT SELECTION

At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
- Selects the LRC mode
- Sets the CI value to 0.

LIMITATIONS

The flight crew cannot change the FMS speed mode, when the DES, APPR, GA, or DONE flight phase is active.

CI ENTRY FIELD

Indicates the Cost Index (CI).
The CI entry field must not be empty.

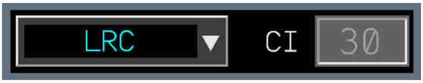
The CI value is:
- Manually entered by the flight crew, or
- Automatically entered, if one of the following occurs:
  - The flight crew enters a company route in the CPNY RTE entry field, and a CI is associated with the entered company route
  - A received company or ATC flight plan is inserted, and a CI is associated with the route of the received flight plan.

Note: *1. The FMS automatically synchronizes all of the following:*
- *The CI entry field of the CLB, CRZ, and DES panels of the ACTIVE/PERF page*
- *The CI entry field of the ACTIVE/FUEL&LOAD page (Refer to page)*
- *The CI entry field of the ACTIVE/INIT page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The CI entry field of the CLB, CRZ, and DES panels of the SEC1(2)(3)/PERF page*
- *The CI entry field of the SEC1(2)(3)/FUEL&LOAD page (Refer to page)*
- *The CI entry field of the SEC1(2)(3)/INIT page (Refer to page).*

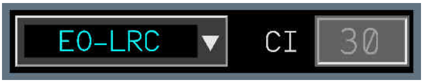
If the FMS speed mode is LRC, the CI entry field still displays the CI value that is associated with the ECON mode, but the flight crew cannot change the CI value.

CI Entry Field in LRC Mode



If the FMS speed mode is EO-LRC, the CI entry field still displays the CI value that is associated with the EO-ECON mode, but the flight crew cannot change the CI value.

CI Entry Field in EO-LRC Mode



ENTRY FORMAT

Refer to DSC-22-FMS-20-80 COST INDEX (CI).

DEFAULT VALUE

At power-up and during the PREFLIGHT flight phase, the default FMS speed mode is ECON with no CI value. Then, if the flight crew does not enter a CI value before the flight crew enters the ZFW value or before engine start, the FMS automatically:
- Selects the LRC mode
- Sets the CI value to 0.

LIMITATIONS

The CI cannot be changed, when the DES, APPR, or GA flight phase is active.

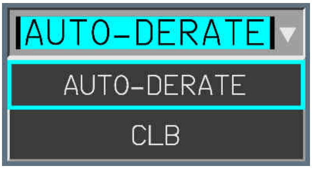
Ident.: DSC-22-FMS-20-20-20-270-00004108.0001001 / 04 DEC 14

THR LIST

Indicates the climb thrust.
The flight crew selects the climb thrust from the THR list.

The THR list has the following options:
- AUTO-DERATE: The climb thrust is an auto-derated thrust.
  The FMS automatically computes the appropriate reduced level of the climb thrust.
  L2 For more information about auto-derated thrust, *Refer to DSC-22-FMS-10-50-40 Auto-Derated Thrust during Climb*.
- L1 CLB: The climb thrust is the maximum climb thrust.

THR List



The AUTO-DERATE option is automatically selected by default.

Ident.: DSC-22-FMS-20-20-20-270-00000330.0001001 / 22 APR 14

SPEED MODE TABLE [BEFORE CLB]

Before the CLB flight phase becomes active, the speed mode table displays the following speed modes.

Note: *The speed mode that will be set, when the CLB flight phase becomes active, is displayed in green font.*

PRESEL

The flight crew uses the PRESEL entry field to preset a selected speed target for the CLB flight phase.

After a speed entry, the FMS computes:
- The corresponding preselected Mach
- The time and distance predictions that are associated with the preselected speed.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

After the flight crew presets a selected speed, all of the following occur, when the CLB flight phase becomes active (provided that the managed speed/Mach control is engaged):
- The selected speed/Mach control automatically engages
- The preselected speed is the climb speed target for the Flight Guidance (FG).

Note: The preselected speed has priority over the NOISE speed.

The flight crew can always cancel the preselection by clearing the PRESEL entry field.

Entry Format

Refer to DSC-22-FMS-20-80 SPD.

MANAGED

Indicates:
- The managed climb speed
- The time and distance predictions that are associated with the managed climb speed.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

When the CLB flight phase becomes active, this managed climb speed is the climb speed target for the FG, if all of the following apply:
- There is no preselected speed
- The managed speed/Mach control is engaged.

ECON(LRC)

Indicates the predicted ECON(LRC) climb speed/Mach.
The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.

The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.
For more information about the computation of the ECON/LRC climb speed/Mach, *Refer to DSC-22-FMS-10-50-30 CLB*.

Note: 1. *The speed mode table displays the ECON mode line, only if all of the following apply:*
- *The FMS speed mode is ECON*
- *The managed climb speed/Mach is different from the ECON climb speed/Mach.*

2. *The speed mode table displays the LRC mode line, only if all of the following apply:*
- *The FMS speed mode is LRC*
- *The managed climb speed/Mach is different from the LRC climb speed/Mach.*

Ident.: DSC-22-FMS-20-20-20-270-00004109.0001001 / 22 APR 14

SPEED MODE TABLE [IN CLB]

In the CLB flight phase, the first line of the speed mode table displays the active speed mode: Selected or managed.
If the selected speed/Mach control is engaged, the second line of the speed mode table displays the managed climb speed/Mach.
In specific cases, the speed mode table also displays the ECON(LRC)(RTA) climb speed/Mach on an assigned line.

SELECTED

Indicates:
- The selected AFS CP speed/Mach
- The time and distance predictions that are associated with the selected AFS CP speed/Mach. The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

MANAGED

Indicates:
- The managed climb speed/Mach
- The time and distance predictions that are associated with the managed climb speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

This managed climb speed/Mach is the climb speed/Mach target for the FG, if the flight crew engages the managed speed/Mach control.

If there is no speed restriction, the speed mode table displays the ECON or LRC label, as follows:
- The ECON label indicates that the managed climb speed/Mach is the ECON speed/Mach
  The managed climb speed/Mach is the ECON speed/Mach, if the FMS speed mode is ECON.
  The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.
- The LRC label indicates that the managed climb speed/Mach is the LRC speed/Mach.
  The managed climb speed/Mach is the LRC speed/Mach, if the FMS speed mode is LRC.
  The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.

For information about the computation of the ECON/LRC climb speed/Mach, *Refer to DSC-22-FMS-10-50-30 CLB*.

If there is a speed restriction, the speed mode table displays a specific label that indicates the type of speed restriction that is currently applicable. The speed restriction label can be one of the following:
- NOISE SPD: The managed speed is the NOISE speed
  For more information about the NOISE speed, *Refer to DSC-22-FMS-10-50-60 NOISE Parameters*.
- SPD CSTR: The managed speed is the speed constraint
- SPD LIM: The managed speed is the climb speed limit
- HOLD SPD: The managed speed is the holding speed
- PROC SPD: The managed speed is the ICAO holding speed limit of a holding procedure
- RTA: The managed speed/Mach is the FMS-computed speed/Mach that is based on a time constraint (RTA).

The information that is related to the applicable speed restriction appears below the speed table (*Refer to Speed Restriction*).

ECON(LRC)(RTA)

Indicates the predicted ECON(LRC)(RTA) climb speed/Mach.
The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.
The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.
The RTA speed/Mach is the FMS-computed speed/Mach that is based on a time constraint (RTA).

For information about:
- The computation of the ECON/LRC climb speed/Mach, *Refer to DSC-22-FMS-10-50-30 CLB*
- The time constraint revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

Note: *1. The speed mode table displays the ECON mode line, only if all of the following apply:*
  - *The FMS speed mode is ECON*
  - *The managed climb speed/Mach is different from the ECON climb speed/Mach.*

2. The speed mode table displays the LRC mode line, only if all of the following apply:
  - *The FMS speed mode is LRC*
  - *The managed climb speed/Mach is different from the LRC climb speed/Mach.*

3. The speed mode table displays the RTA mode line, only if the managed climb speed/Mach is different from the RTA climb speed/Mach.

Ident.: DSC-22-FMS-20-20-20-270-00004112.0001001 / 22 APR 14

SPEED MODE TABLE [EO IN CLB]

If the EO mode is active during the CLB flight phase, the first line of the speed mode table displays the active speed mode: Selected or managed.
If the selected speed/Mach control is engaged, the second line of the speed mode table displays the managed engine-out climb speed.

SELECTED

Indicates:
- The selected AFS CP speed/Mach
- The time and distance predictions that are associated with the selected AFS CP speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

MANAGED

Indicates:
- The managed engine-out climb speed
- The time and distance predictions that are associated with the managed engine-out climb speed.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

This managed engine-out climb speed is the climb speed target for the FG, if the flight crew engages the managed speed/Mach control.

The speed mode table displays a specific label that indicates the managed speed type. This specific label can be one of the following:
- EO-GDOT: The managed speed is the EO-GDOT speed
  The EO-GDOT speed is the managed speed target, when the aircraft climbs or descends.
- EO-LRC: The managed speed is the EO-LRC speed

  The EO-LRC speed is the managed speed target, when all of the following apply:
  - The aircraft is in level flight
  - The FMS speed mode is EO-LRC.
- EO-ECON: The managed speed is the EO-ECON speed.

  The EO-ECON speed is the managed speed target, when all of the following apply:
  - The aircraft is in level flight
  - The FMS speed mode is EO-ECON.

For information about the EO mode in the CLB flight phase, *Refer to DSC-22-FMS-10-60 Engine-Out during the CLB Flight Phase*.

Ident.: DSC-22-FMS-20-20-20-270-00004117.0001001 / 22 APR 14

PRED TO ENTRY FIELD [CLB]

Indicates the prediction reference altitude.
The FMS uses this altitude to compute the time and distance predictions that are associated with the selected and managed speed modes of the speed mode table.
In the PREFLIGHT flight phase, the PRED TO entry field displays dashes by default.
When the T.O flight phase becomes active, the PRED TO entry field displays the AFS CP selected altitude by default.
The flight crew can always overwrite the default value.

L2

AUTOMATIC UPDATE

If the flight crew changes the AFS CP selected altitude to a value that is above the aircraft altitude, the prediction reference altitude is set to the AFS CP selected altitude. This update occurs, only if the flight crew did not enter any prediction reference altitude.
If the aircraft is below the AFS CP selected altitude and the aircraft reaches an altitude that is above the prediction reference altitude, the prediction reference altitude is set to the AFS CP selected altitude.

L3 If the aircraft is above the AFS CP selected altitude and above the prediction reference altitude, the PRED TO entry field displays dashes.

L1

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 PRED TO (ALTITUDE).

Ident.: DSC-22-FMS-20-20-20-270-00004118.0001001 / 22 APR 14

SPEED RESTRICTION [BEFORE CLB]

Indicates:
- The type of speed restriction, if any, that applies to the managed climb speed
- The information that is related to the speed restriction.

Before the CLB flight phase, the speed restriction can be a climb speed limit. In this case, the information that is related to the speed restriction is the speed limit and the end altitude.
For information about the SPD LIMIT revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

Ident.: DSC-22-FMS-20-20-20-270-00004110.0001001 / 02 OCT 14

SPEED RESTRICTION [IN CLB]

Indicates:
- The type of speed restriction, if any, that applies to the managed climb speed
- The information that is related to the speed restriction.

The speed restriction can be one of the following:

- SPD CSTR: Indicates the speed constraint and the end waypoint
  For information about the SPD CSTR revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

SPD CSTR

SPD CSTR 220KT / AMOLO

- CLB SPD LIM: Indicates the climb speed limit and the end altitude
  For information about the SPD LIMIT revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

CLB SPD LIM

CLB SPD LIM 250KT / 10000FT

- HOLD SPD: Indicates the holding speed and the holding exit fix
  For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

HOLD SPD

HOLD SPD 230KT / NYLON

- PROC SPD: Indicates the ICAO holding speed limit and the holding entry/exit fix.
  For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

PROC SPD

PROC SPD 260KT / NYLON

Ident.: DSC-22-FMS-20-20-20-270-00004120.0001001 / 22 APR 14

SPD CSTR BUTTON

When clicked, displays the SPD panel of the VERT REV page (*Refer to page*).
On the SPD panel of the VERT REV page, the flight crew can display, create, or delete a speed constraint or a speed limit.

Ident.: DSC-22-FMS-20-20-20-270-00004111.0001001 / 22 APR 14

TRANS

Indicates the climb transition altitude.

Ident.: DSC-22-FMS-20-20-20-270-00004113.0001001 / 03 JUL 14

SPEED MODE TABLE [BEFORE CRZ]

Before the CRZ flight phase becomes active, the speed mode table displays the following speed modes.

Note: *The speed mode that will be set, when the CRZ flight phase becomes active, is displayed in green font.*

PRESEL

The flight crew uses the PRESEL entry fields to preset a selected speed or Mach target for the CRZ flight phase.
After a speed(Mach) entry, the FMS computes the time and distance predictions that are associated with the preselected speed(Mach).
The time prediction corresponds to the UTC time at which the aircraft will reach the T/D.
The distance prediction corresponds to the distance between the aircraft present position and the T/D.

After the flight crew presets a selected speed(Mach), all of the following occur, when the CRZ flight phase becomes active (provided that the managed speed/Mach control is engaged):
- The selected speed/Mach control automatically engages
- The preselected speed(Mach) is the cruise speed(Mach) target for the FG.

The flight crew can always cancel the preselection by clearing the PRESEL entry fields.

ENTRY FORMAT

For the entry format of:
- Speed, *Refer to DSC-22-FMS-20-80 SPD*
- Mach, *Refer to DSC-22-FMS-20-80 MACH*.

MANAGED

Indicates:
- The managed cruise speed/Mach
- The time and distance predictions that are associated with the managed cruise speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the header line of the speed mode table.

When the CRZ flight phase becomes active, this managed cruise speed/Mach is the cruise speed/Mach target for the FG, if all of the following apply:
- There is no preselected speed
- The managed speed/Mach control is engaged.

ECON

Indicates the predicted ECON cruise speed/Mach.
The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.

For information about the computation of the ECON cruise speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*.

Note: *The speed mode table displays the ECON mode line, only if all of the following apply:*
- *The FMS speed mode is ECON*
- *The managed cruise speed/Mach is different from the ECON cruise speed/Mach.*

LRC

Indicates the predicted LRC speed/Mach.
The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.
For information about the computation of the LRC speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*.

Note: *The speed mode table displays the LRC mode line, only if the FMS speed mode is ECON.*

MAX TURB

Indicates the predicted MAX TURB speed/Mach.
The MAX TURB speed/Mach is the maximum speed/Mach to safely fly in a turbulent atmosphere.
For information about the computation of the MAX TURB speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*.
L2 For information on the procedure during severe turbulence in cruise, *Refer to PRO-ABN-MISC [ABN] MISC SEVERE TURBULENCE IN CRUISE*.

Ident.: DSC-22-FMS-20-20-20-270-00004114.0001001 / 03 JUL 14

SPEED MODE TABLE [IN CRZ]

In the CRZ flight phase, the first line of the speed mode table displays the active speed mode: Selected or managed.
If the selected speed/Mach control is engaged, the second line of the speed mode table displays the managed cruise speed/Mach.

In specific cases, the speed mode table also displays the following speeds on assigned lines:
- The ECON(RTA) cruise speed/Mach
- The LRC speed/Mach.

The speed mode table displays the MAX TURB speed/Mach on an assigned line.

SELECTED

Indicates:
- The selected AFS CP speed/Mach
- The time and distance predictions that are associated with the selected AFS CP speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the header line of the speed mode table.

MANAGED

Indicates:
- The managed cruise speed/Mach
- The time and distance predictions that are associated with the managed cruise speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the header line of the speed mode table.

This managed cruise speed/Mach is the cruise speed/Mach target for the FG, if the flight crew engages the managed speed/Mach control.

If there is no speed restriction, the speed mode table displays the ECON or LRC label, as follows:
- The ECON label indicates that the managed cruise speed/Mach is the ECON speed/Mach
  The managed cruise speed/Mach is the ECON speed/Mach, if the FMS speed mode is ECON.
  The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.
- The LRC label indicates that the managed cruise speed/Mach is the LRC speed/Mach.
  The managed cruise speed/Mach is the LRC speed/Mach, if the FMS speed mode is LRC.
  The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.

For more information about the computation of the ECON/LRC cruise speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*.

If there is a speed restriction, the speed mode table displays a specific label that indicates the type of speed restriction that is currently applicable. The speed restriction label can be one of the following:
- SPD LIM: The managed speed is the climb speed limit
- CMS: The managed speed/Mach is a constant Mach

- HOLD SPD: The managed speed is the holding speed
- PROC SPD: The managed speed is the ICAO holding speed limit of a holding procedure.

The information that is related to the applicable speed restriction appears below the speed table (*Refer to Speed Restriction*).

ECON(RTA)

Indicates the predicted ECON(RTA) cruise speed/Mach.
The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.
The RTA speed/Mach is the FMS-computed speed/Mach that is based on a time constraint (RTA).

For information about:
- The computation of the ECON cruise speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*
- The time constraint revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

Note: 1. *The speed mode table displays the ECON mode line, only if all of the following apply:*
  - *The FMS speed mode is ECON*
  - *The managed cruise speed/Mach is different from the ECON cruise speed/Mach.*

2. *The speed mode table displays the RTA mode line, only if the managed cruise speed/Mach is different from the RTA cruise speed/Mach.*

LRC

Indicates the predicted LRC speed/Mach.
The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.
For information about the computation of the LRC speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*.

Note: *The speed mode table displays the LRC mode line, only if the FMS speed mode is ECON.*

MAX TURB

Indicates the predicted MAX TURB speed/Mach.
The MAX TURB speed/Mach is the maximum speed/Mach to safely fly in a turbulent atmosphere.
For information about the computation of the MAX TURB speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*.
L2 For information on the procedure during severe turbulence in cruise, *Refer to PRO-ABN-MISC [ABN] MISC SEVERE TURBULENCE IN CRUISE*.

Ident.: DSC-22-FMS-20-20-20-270-00004116.0001001 / 03 JUL 14

SPEED MODE TABLE [EO IN CRZ]

If the EO mode is active during the CRZ flight phase, the first line of the speed mode table displays the active speed mode: Selected or managed.
If the selected speed/Mach control is engaged, the second line of the speed mode table displays the managed engine-out cruise speed.

SELECTED

Indicates:
- The selected AFS CP speed/Mach
- The time and distance predictions that are associated with the selected AFS CP speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the header line of the speed mode table.

MANAGED

Indicates:
- The managed engine-out cruise speed
- The time and distance predictions that are associated with the managed engine-out cruise speed.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the header line of the speed mode table.

This managed engine-out cruise speed is the cruise speed target for the FG, if the flight crew engages the managed speed/Mach control.

The speed mode table displays a specific label that indicates the managed speed type. This specific label can be one of the following:

- EO-GDOT: The managed speed is the EO-GDOT speed
  The EO-GDOT speed is the managed speed target, when the aircraft climbs or descends.
- EO-LRC: The managed speed is the EO-LRC speed

  The EO-LRC speed is the managed speed target, when all of the following apply:
  - The aircraft is in level flight
  - The FMS speed mode is EO-LRC.
- EO-ECON: The managed speed is the EO-ECON speed.

  The EO-ECON speed is the managed speed target, when all of the following apply:
  - The aircraft is in level flight
  - The FMS speed mode is EO-ECON.

For information about the EO mode in the CRZ flight phase, *Refer to DSC-22-FMS-10-60 Engine-Out during the CRZ Flight Phase*.

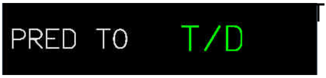
MAX TURB

Indicates the predicted MAX TURB speed/Mach.
The MAX TURB speed/Mach is the maximum speed/Mach to safely fly in a turbulent atmosphere.
For information about the computation of the MAX TURB speed/Mach, *Refer to DSC-22-FMS-10-50-30 CRZ*.
L2 For information on the procedure during severe turbulence in cruise, *Refer to PRO-ABN-MISC [ABN] MISC SEVERE TURBULENCE IN CRUISE*.

Ident.: DSC-22-FMS-20-20-20-270-00004125.0001001 / 22 APR 14

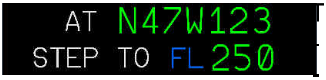
PREDICTION REFERENCE

Indicates the prediction reference.
The FMS uses this prediction reference to compute the time and distance predictions that are associated with the selected and managed speed modes of the speed mode table.
The prediction reference can be one of the following:



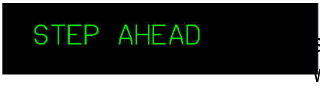
PRED TO T/D

The prediction reference is the Top of Descent (T/D).



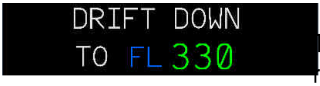
AT N47W123
STEP TO FL250

The prediction reference is the starting point of:
- The next step climb, or
- The next step descent.



STEP AHEAD

ndicates that the aircraft is at less than 20 NM from the step starting waypoint. The prediction reference is the step starting waypoint.



DRIFT DOWN
TO FL 330

ndicates the drift-down altitude.
The prediction reference is the point at which the aircraft will reach the drift-down altitude.

Note: *The DRIFT DOWN prediction reference is displayed, only when all of the following apply:*
- *The EO mode is active*
- *The aircraft is above the drift-down altitude.*

For information about the drift-down altitude, *Refer to DSC-22-FMS-10-60 Drift-Down Altitude*.

Ident.: DSC-22-FMS-20-20-20-270-00004115.0001001 / 02 APR 15

SPEED RESTRICTION [IN CRZ]

Indicates:
- The type of speed restriction, if any, that applies to the managed cruise speed
- The information that is related to the speed restriction.

The speed restriction can be one of the following:
- CLB SPD LIM: Indicates the climb speed limit and the end altitude
  For information about the SPD LIMIT revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

CLB SPD LIM

CLB SPD LIM 250KT / FL100

- HOLD SPD: Indicates the holding speed and the holding exit fix
  For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

HOLD SPD

HOLD SPD 230KT / NYLON

- PROC SPD: Indicates the ICAO holding speed limit and the holding entry/exit fix.
  For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

PROC SPD

PROC SPD 260KT / NYLON

Ident.: DSC-22-FMS-20-20-20-270-00004134.0001001 / 22 APR 14

DEST

Indicates:
- The ident of the destination airport
- The Estimated Time of Arrival (ETA), in UTC(flight) time, at the destination airport

L2 The time reference is defined as follows:

- In the PREFLIGHT flight phase:
  - ■ If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - ■ If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - ■ If the UTC time is valid, the time reference is the UTC time
  - ■ If the UTC time is not valid, the time reference is the flight time.

L1
- The Estimated Fuel on Board (EFOB) at the destination airport.
  The EFOB at the destination airport appears in amber, if its value is below the minimum fuel at destination that is displayed on the FUEL&LOAD page (*Refer to page*). In addition to the amber EFOB, if the active flight phase is CRZ, DES, APPR, or GA, the FMS message area displays the DEST EFOB BELOW MIN message (*Refer to message*).

Note: *On the SEC/PERF page, the EFOB at the destination airport is always displayed in white (even if its value is below the minimum fuel at destination).*

Ident.: DSC-22-FMS-20-20-20-270-00004135.0001001 / 14 APR 14

CMS BUTTON

When clicked, displays the CMS panel of the VERT REV page (*Refer to page*).
On the CMS panel of the VERT REV page, the flight crew can display, create, or delete a Constant Mach Segment (CMS).

Ident.: DSC-22-FMS-20-20-20-270-00004136.0001001 / 22 APR 14

STEP ALTs BUTTON

When clicked, displays the STEP ALTs panel of the VERT REV page (*Refer to page*).
On the STEP ALTs panel of the VERT REV page, the flight crew can display, create, or delete step altitudes.

Ident.: DSC-22-FMS-20-20-20-270-00004139.0002001 / 01 SEP 16

DES CABIN RATE ENTRY FIELD

Indicates the maximum descent cabin rate.

The maximum descent cabin rate is the maximum of the following two values:
- The average descent rate of the cabin
  The FMS computes the average descent rate of the cabin, based on the difference between the pressure at the cruise flight level and the pressure at destination.
- The maximum descent rate of the cabin.
  The maximum descent rate is 270 ft/min by default. The flight crew can overwrite the default value in the DES CABIN RATE entry field.

Note: *To define the maximum of the two values, the FMS uses the absolute values (without the minus sign).*

A value that the FMS computes is displayed in small font. A value that the flight crew enters is displayed in large font.
The FMS computes the T/D in order to respect the maximum descent cabin rate.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 DES CABIN RATE.

Ident.: DSC-22-FMS-20-20-20-270-00004119.0001001 / 22 APR 14

SPEED MODE TABLE [BEFORE DES]

Before the DES flight phase becomes active, the flight crew can enter the managed speed/Mach target for the DES flight phase in the applicable entry fields.

The default value for the managed speed/Mach target is:
- The ECON descent speed/Mach, if the FMS speed mode is ECON
- The LRC descent speed/Mach, if the FMS speed mode is LRC
- The RTA speed/Mach, if there is a time constraint in the flight plan.

The flight crew can always set the ECON(LRC)(RTA) speed/Mach again, by clearing of the entry fields.
The FMS computes the time and distance predictions that are associated with the entered managed speed/Mach.
The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
The prediction reference is displayed in the PRED TO entry field
When the DES flight phase becomes active while the managed speed/Mach control is engaged, the speed/Mach that was entered in the entry fields is the descent speed/Mach target for the FG.

ENTRY FORMAT

For the entry format of:
- Speed, *Refer to DSC-22-FMS-20-80 SPD*
- Mach, *Refer to DSC-22-FMS-20-80 MACH*.

Ident.: DSC-22-FMS-20-20-20-270-00004124.0001001 / 22 APR 14

SPEED MODE TABLE [IN DES]

In the DES flight phase, the first line of the speed mode table displays the active speed mode: Selected or managed.
If the selected speed/Mach control is engaged, the second line of the speed mode table displays the managed descent speed/Mach.
In specific cases, the speed mode table also displays the ECON(LRC) descent speed/Mach on an assigned line.

SELECTED

Indicates:
- The selected AFS CP speed/Mach
- The time and distance predictions that are associated with the selected AFS CP speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

MANAGED

Indicates:
- The managed descent speed/Mach
- The time and distance predictions that are associated with the managed descent speed/Mach.
  The time prediction corresponds to the UTC time at which the aircraft will reach the prediction reference.
  The distance prediction corresponds to the distance between the aircraft present position and the prediction reference.
  The prediction reference is displayed in the PRED TO entry field.

This managed descent speed/Mach is the descent speed/Mach target for the FG, if the flight crew engages the managed speed/Mach control.

If there is no speed restriction, the speed mode table displays the ECON or LRC label, as follows:

- The ECON label indicates that the managed descent speed/Mach is the ECON speed/Mach
  The managed descent speed/Mach is the ECON speed/Mach, if the FMS speed mode is ECON.
  The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.
- The LRC label indicates that the managed descent speed/Mach is the LRC speed/Mach.
  The managed descent speed/Mach is the LRC speed/Mach, if the FMS speed mode is LRC.
  The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.

For information about the computation of the ECON/LRC descent speed/Mach, *Refer to DSC-22-FMS-10-50-30 DES*.

If there is a speed restriction, the speed mode table displays a specific label that indicates the type of speed restriction that is currently applicable. The speed restriction label can be one of the following:

- SPD LIM: The managed speed is the descent speed limit
- SPD CSTR: The managed speed is the speed constraint
- HOLD SPD: The managed speed is the holding speed
- PROC SPD: The managed speed is the ICAO holding speed limit of a holding procedure
- RTA: The managed speed/Mach is the FMS-computed speed/Mach that is based on a time constraint (RTA).

The information that is related to the applicable speed restriction appears below the speed table (*Refer to Speed Restriction*).

ECON(LRC)

Indicates the predicted ECON(LRC) descent speed/Mach.
The ECON speed/Mach is the FMS-computed speed/Mach that is based on the cost index.
The LRC speed/Mach is the FMS-computed speed/Mach that corresponds to the long range cruise.
For information about the computation of the ECON/LRC descent speed/Mach, *Refer to DSC-22-FMS-10-50-30 DES*.

Note: *1. The speed mode table displays the ECON mode line, only if all of the following apply:*
- *The FMS speed mode is ECON*
- *The managed descent speed/Mach is different from the ECON descent speed/Mach.*

2. The speed mode table displays the LRC mode line, only if all of the following apply:
- *The FMS speed mode is LRC*
- *The managed descent speed/Mach is different from the LRC descent speed/Mach.*

Ident.: DSC-22-FMS-20-20-20-270-00004140.0001001 / 22 APR 14

PRED TO ENTRY FIELD (DES)

Indicates the prediction reference altitude.
The FMS uses this altitude to compute the time and distance predictions that are associated with the selected and managed speed modes of the speed mode table.
The PRED TO entry field is available, only when the DES flight phase is active.

L2 **AUTOMATIC UPDATE**

If the flight crew changes the AFS CP selected altitude to a value that is below the aircraft altitude, the prediction reference altitude is set to the AFS CP selected altitude. This update occurs, only if the flight crew did not enter any prediction reference altitude.
If the aircraft is above the AFS CP selected altitude and the aircraft reaches an altitude that is below the prediction reference altitude, the prediction reference altitude is set to the AFS CP selected altitude.

L3 If the aircraft is below the AFS CP selected altitude and below the prediction reference altitude, the PRED TO entry field displays dashes.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 PRED TO (ALTITUDE).

Ident.: DSC-22-FMS-20-20-20-270-00004146.0001001 / 02 OCT 14

SPEED RESTRICTION [IN DES]

Indicates:
- The type of speed restriction, if any, that applies to the managed descent speed
- The information that is related to the speed restriction.

The speed restriction can be one of the following:

- SPD CSTR: Indicates the speed constraint and the end waypoint
  For information about the SPD CSTR revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

SPD CSTR

SPD CSTR 210KT / AKOMA

- DES SPD LIM: Indicates the descent speed limit and the end altitude
  For information about the SPD LIMIT revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

DES SPD LIM

DES SPD LIM 250KT / FL100

- HOLD SPD: Indicates the holding speed and the holding exit fix
  For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

HOLD SPD

HOLD SPD 230KT / NYLON

- PROC SPD: Indicates the ICAO holding speed limit and the holding entry/exit fix.
  For information about the HOLD revision, *Refer to DSC-22-FMS-10-40-20 Purpose*.

PROC SPD

PROC SPD 260KT / NYLON

Ident.: DSC-22-FMS-20-20-20-270-00004147.0001001 / 22 APR 14

TRANS ENTRY FIELD [DES/APPR]

Indicates the descent transition flight level.

Note: 1. *The FMS automatically synchronizes the TRANS entry field of the DES panel of the ACTIVE/PERF page and the TRANS entry field of the APPR panel ACTIVE/PERF page.*
2. *The FMS automatically synchronizes the TRANS entry field of the DES panel of the SEC1(2)(3)/PERF page and the TRANS entry field of the APPR panel of the SEC1(2)(3)/PERF page.*

DEFAULT VALUE

The default value is the transition flight level that is associated with the arrival procedure of the destination airport, and that is stored in the navigation database. If there is no stored transition flight level in the navigation database, the TRANS entry field displays dashes.
The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 TRANS (FLIGHT LEVEL).

Ident.: DSC-22-FMS-20-20-20-270-00004148.0001001 / 22 APR 14

VERT DEV

Indicates the vertical deviation in feet.
The FMS computes the vertical deviation. The vertical deviation is the difference between the current altitude of the aircraft and the FMS vertical profile.

Note: *The PFD displays a symbol that is related to the vertical deviation. For more information, Refer to DSC-22-FMS-20-40 Vertical Deviation.*

Ident.: DSC-22-FMS-20-20-20-270-00004152.0001001 / 14 APR 14

APPR

Indicates the ident of the approach procedure.
The flight crew can check, select, or change the approach procedure on the ARRIVAL page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-270-00004153.0001001 / 22 APR 14

DESTINATION IDENT

Indicates the ident of the destination airport.

Ident.: DSC-22-FMS-20-20-20-270-00004154.0001001 / 22 APR 14

LW

Indicates the Landing Weight (LW).

- **Before engine start:**
  LW = TOW - trip fuel
- **After engine start:**
  LW = GW - trip fuel - taxi fuel
- **In flight:**
  LW = GW - trip fuel

Ident.: DSC-22-FMS-20-20-20-270-00004155.0001001 / 22 APR 14

WIND DATA

The flight crew enters in the MAG WIND entry fields the wind direction and the wind speed of the magnetic surface wind at the destination airport.

L2 If the airport reference is true north, the wind is the true wind. The label next to the entry fields is TRUE WIND instead of MAG WIND.

L1 *Note:* *1. The FMS automatically synchronizes all of the following:*
- *The MAG WIND entry fields of the DES panel of the ACTIVE/PERF page*
- *The surface wind in the T.WIND entry fields of the DES panel of the ACTIVE/WIND page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The MAG WIND entry fields of the DES panel of the SEC1(2)(3)/PERF page*
- *The surface wind in the T.WIND entry fields of the DES panel of the SEC1(2)(3)/WIND page (Refer to page).*

3. In order to synchronize the entry fields, if the north reference is not the same on the PERF page and on the WIND page, the FMS uses the magnetic variation at the destination airport to change true wind from magnetic wind, and vice versa.

When there is a valid surface wind, the FMS computes the headwind and crosswind components, and displays the computed values below the MAG WIND entry fields.

ENTRY FORMAT

For the entry format of:
- Wind direction, *Refer to DSC-22-FMS-20-80 WIND DIRECTION*
- Wind speed, *Refer to DSC-22-FMS-20-80 WIND SPEED*.

Ident.: DSC-22-FMS-20-20-20-270-00004157.0001001 / 22 APR 14

OAT ENTRY FIELD

Indicates the Outside Air Temperature (OAT).

The FMS uses this OAT to:
- Perform a more precise computation of the descent profile
- Correct the computation of the FLS beam in the case of cold weather.
  For more information about the computation of the FLS beam in the case of cold weather, *Refer to DSC-22-FMS-10-30-40 Cold Weather Correction of the FLS Vertical Deviation*.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 OAT.

Ident.: DSC-22-FMS-20-20-20-270-00004158.0001001 / 22 APR 14

QNH ENTRY FIELD

Indicates the QNH at destination.

The FMS uses this QNH to:

- Compute the descent profile
- Compute the FLS beam.
  For more information about the use of the QNH to compute the FLS beam, , *Refer to DSC-22-FMS-10-30-40 Baro-Correction of the FLS Vertical Deviation*.

The pressurization system also uses this QNH, in order to automatically control the cabin pressurization. Therefore, a QNH entry that is not correct may result in a cabin pressurization profile that is not correct.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 QNH(QFE).

Ident.: DSC-22-FMS-20-20-20-270-00004159.0001001 / 14 APR 14

BARO/RADIO ENTRY FIELDS

In the BARO or RADIO entry field, the flight crew enters the required minimum altitude that is applicable to the approach procedure.
The FMS considers an entry in the BARO entry field as barometric altitude (i.e. an AMSL altitude). For example, the flight crew enters the minimum descent altitude of a GNSS (RNAV) approach with LNAV minima in the BARO entry field.
The FMS considers an entry in the RADIO entry field as a radio altitude (i.e. a height). For example, the flight crew enters the decision height of an ILS CAT II approach in the RADIO entry field.

ENTRY FORMAT

For the entry format of:

- Barometric altitude, *Refer to DSC-22-FMS-20-80 BARO (ALTITUDE)*
- Radio altitude, *Refer to DSC-22-FMS-20-80 RADIO (ALTITUDE)*.

Ident.: DSC-22-FMS-20-20-20-270-00004160.0001001 / 22 APR 14

GDOT, S, F, AND VREF

Indicate the following speeds for approach: GDOT , S, F, and VREF.

Note: *The FMS uses estimated weight and CG to compute the operating speeds that are displayed on the APPR panel of the PERF page. The PRIMs use the current weight and CG to compute the operating speeds that are displayed on the PFD. Therefore, the operating speeds that are displayed on the PFD may be different from the operating speeds that are displayed on the APPR panel of the PERF page.*

For more information about the reference and operating speeds that the FMS computes for approach, *Refer to DSC-22-FMS-10-50-30 APPR*.

Ident.: DSC-22-FMS-20-20-20-270-00004161.0001001 / 22 APR 14

LANDING CONFIGURATION AND VLS

The flight crew selects the landing configuration:
- CONF3, or
- FULL.
  FULL is selected by default.

The FMS computes the VLS that is associated with the selected landing configuration, and displays the computed value below the landing configuration option list.

Note: *The FMS uses the selected landing configuration, estimated weight and CG, and the destination airport elevation to compute the VLS that is displayed on the APPR panel of the PERF page. The PRIMs use the current weight, CG, flaps configuration, and altitude to compute the VLS that is displayed on the PFD. Therefore, the VLS that is displayed on the PFD may be different from the VLS that is displayed on the APPR panel of the PERF page.*

For more information about the VLS that the FMS computes for approach, *Refer to DSC-22-FMS-10-50-30 APPR*.

Ident.: DSC-22-FMS-20-20-20-270-00004162.0001001 / 22 APR 14

VAPP ENTRY FIELD

Indicates the final approach speed: VAPP.
The FMS computes the VAPP.
For information on how the FMS computes the VAPP, *Refer to DSC-22-FMS-10-50-30 APPR*.
The VAPP that the FMS computes is displayed in small font.
The flight crew can always overwrite the value that the FMS computes. The value that the flight crew enters is displayed in large font.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 VAPP.

Ident.: DSC-22-FMS-20-20-20-270-00004167.0001001 / 22 APR 14

F, S, AND GDOT [GA]

Indicate the following operating speeds for go-around: F, S, and GDOT.

Note: *The FMS uses estimated weight and CG to compute the operating speeds that are displayed on the GA panel of the PERF page. The PRIMs use the current weight and CG to compute the operating speeds that are displayed on the PFD. Therefore, the operating speeds that are displayed on the PFD may be different from the operating speeds that are displayed on the GA panel of the PERF page.*

For more information about the operating speeds that the FMS computes for go-around, *Refer to DSC-22-FMS-10-50-30 GA*.

Ident.: DSC-22-FMS-20-20-20-270-00004168.0001001 / 22 APR 14

THR RED ENTRY FIELD [GA]

Indicates the thrust reduction altitude.
The thrust reduction altitude is the altitude at which the flight crew should reduce the thrust from TOGA to CL.

DEFAULT VALUE

The default value for the thrust reduction altitude is:

- The value that is associated with the destination airport, and that is stored in the navigation database, or
- The value that is the sum of:
  - The destination airport elevation (stored in the navigation database)
  - The thrust reduction height (defined by the Operator in the AMI file).
    The default value of the thrust reduction height is 1 500 ft.

The flight crew can always overwrite the default value.

L2 AUTOMATIC UPDATE

The FMS considers that the aircraft levels off below the thrust reduction altitude, if all of the following occur:

- The flight crew enters an AT or AT OR BELOW altitude constraint at a waypoint
- This waypoint is a waypoint that is in the CLB flight phase
- The altitude of this waypoint is below the thrust reduction altitude.

As a result, the altitude of the constraint automatically becomes the new thrust reduction altitude. In this case, the FMS message area displays the NEW THR RED ALT : HHHHH message (*Refer to message*).
In flight, if the flight crew sets the AFS CP selected altitude below the thrust reduction altitude, the AFS CP selected altitude becomes the new thrust reduction altitude.

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 THR RED (ALTITUDE).

Ident.: DSC-22-FMS-20-20-20-270-00004169.0001001 / 14 APR 14

ACCEL ENTRY FIELD [GA]

Indicates the acceleration altitude.
The acceleration altitude is the altitude at which the aircraft accelerates toward the initial climb speed.

At the acceleration altitude, the CLB flight phase becomes active.

DEFAULT VALUE

The default value for the acceleration altitude is:

- The value that is associated with the destination airport, and that is stored in the navigation database, or
- The value that is the sum of:
  - The destination airport elevation (stored in the navigation database)
  - The acceleration height (defined by the Operator in the AMI file).
    The default value of the acceleration height is 1 500 ft.

The flight crew can always overwrite the default value.

L2 AUTOMATIC UPDATE

The FMS considers that the aircraft levels off below the acceleration altitude, if all of the following occur:

- The flight crew enters an AT or AT OR BELOW altitude constraint at a waypoint
- This waypoint is a waypoint that is in the CLB flight phase
- The altitude of this waypoint is below the acceleration altitude.

As a result, the altitude of the constraint becomes the new acceleration altitude. In this case, the FMS message area displays the NEW ACC ALT ALT : HHHHH message (*Refer to message*).
In flight, if the flight crew sets the AFS CP selected altitude below the acceleration altitude, the AFS CP selected altitude becomes the new acceleration altitude.

L1 DEFAULT VALUE

Refer to DSC-22-FMS-20-80 ACCEL ALT.

Ident.: DSC-22-FMS-20-20-20-270-00004170.0001001 / 22 APR 14

EO ACCEL ENTRY FIELD [GA]

Indicates the engine-out acceleration altitude.
The engine-out acceleration altitude is only a reminder. There is no specific system behavior that is associated with this altitude.

DEFAULT VALUE

The default value for the engine-out acceleration altitude is:

- The value that is associated with the destination airport, and that is stored in the navigation database, or
- The value that is the sum of:
  - The destination airport elevation (stored in the navigation database)
  - The engine-out acceleration height (defined by the Operator in the AMI file).
    The default value of the engine-out acceleration height is 1 500 ft.

The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 EO ACCEL (ALTITUDE).

Ident.: DSC-22-FMS-20-20-20-270-00004171.0001001 / 22 APR 14

TRANS ENTRY FIELD [GA]

Indicates the climb transition altitude.

DEFAULT VALUE

The default value is the transition altitude that is associated with the departure procedures of the destination airport, and that is stored in the navigation database. If there is no stored transition altitude in the navigation database, the TRANS entry field displays dashes.
The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 TRANS (ALTITUDE).

PURPOSE

The POSITION/GNSS page:

- Displays the GNSS 1 and GNSS 2 data
  The ADIRS receives the GNSS data from the MMR, and sends this data to the FMS.
- Enables the flight crew to deselect the GPS for the computation of the aircraft position.
  The FMS sent the GPS selection status to the ADIRS. The ADIRS computes the aircraft position.

GPS OPTION LIST

The flight crew selects or deselects the GPS source for the aircraft position computation, by selecting one of the following options:

- SELECTED: The GPS source is selected for the aircraft position computation
  L2 When the DONE flight phase becomes active, the SELECTED option is automatically selected.
- L1 DESELECTED: The GPS source is deselected for the aircraft position computation.

L2 If the GPS source is deselected:

- The FMS message area displays the GPS DESELECTED message (*Refer to message*), when:
  - The aircraft is at 80 NM from the top of descent, or
  - The APPR flight phase becomes active.
- The DESELECTED option of the SBAS ◁ option list is automatically selected, and the SELECTED option of the SBAS ◁ option list is no longer available (*Refer to SBAS Option List*). As a result, the SBAS ◁ is deselected, and cannot be reselected.

Ident.: DSC-22-FMS-20-20-20-280-00004174.0001001 / 22 APR 14

POSITION

Indicates the GNSS 1(2) position latitude/longitude.

Ident.: DSC-22-FMS-20-20-20-280-00004175.0001001 / 22 NOV 17

GNSS MODE

Indicates the GNSS 1(2) mode.

The GNSS mode can be:

- INIT
- ACQ
- SBAS ◁ NAV
- NAV
- TEST
- FAULT
- ALTAID
- DIRSPDAID.

L3 For information about the GNSS modes, *Refer to DSC-34-NAV-40 GNSS Modes*.

UTC

Indicates the GNSS 1(2) UTC time.

Ident.: DSC-22-FMS-20-20-20-280-00004180.0001001 / 14 APR 14

ALT

Indicates the GNSS 1(2) altitude.

Ident.: DSC-22-FMS-20-20-20-280-00004181.0001001 / 22 APR 14

GND SPD

Indicates the GNSS 1(2) ground speed.

Ident.: DSC-22-FMS-20-20-20-280-00013772.0001001 / 14 APR 16

SBAS ◁ OPTION LIST

The flight crew selects or deselects the SBAS for the aircraft guidance, by selecting one of the following options:

- SELECTED: The SBAS is selected for the aircraft guidance
  L2 The SELECTED option is automatically deselected, and is no longer available, if the flight crew deselects the GPS source via the GPS option list (*Refer to GPS Option List*).
- L1 DESELECTED: The SBAS is deselected for the aircraft guidance.
  L2 If the SBAS is deselected, the SLS function is not available. In this case, if the flight crew selects an RNAV (GNSS) approach with LPV minima, the FMS message area displays the SLS NOT AVAIL: SBAS DESELECTED FOR FLS: DESELECT SLS ON NAVAIDS message (*Refer to message*).

Ident.: DSC-22-FMS-20-20-20-280-00004182.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the POSITION/MONITOR page (*Refer to page*).
L2 The RETURN button appears, only if the flight crew accesses the POSITION/GNSS page via the POSITION/MONITOR page.

PURPOSE

On the POSITION/IRS page, the flight crew can:
- Define and monitor the reference position for the IR alignment
- Monitor the IR 1(2)(3) mode and status
- Monitor the IR 1(2)(3) deviation

- Enter the heading, when one or more IRs are in ATT mode
- Monitor the IR 1(2)(3) drift, when the DONE flight phase is active
- Monitor the IR 1(2)(3) data.

IR ALIGNMENT POSITION

Indicates the latitude/longitude of the IR alignment position.
The ADIRS sends this position to the FMS, at the IR alignment.

L2 Dashes appear instead of the latitude/longitude, if one of the following occurs:
- The IRs are not aligned
- The FMCs power up after the IR alignment: The FMS does not have the IR alignment position, because the FMS was not available when the IR alignment position was sent
- Both active FMCs simultaneously reset after the IR alignment: The FMS does not keep the IR alignment position in its memory.

Note: *If only one active FMC powers up (or resets) after the IR alignment, the affected FMC will recover the IR alignment position during the synchronization with the not affected FMC.*

Ident.: DSC-22-FMS-20-20-20-290-00004186.0001001 / 22 APR 14

IR ALIGNMENT LABEL

Indicates the alignment status of the IRs.
The IR alignment label can be one of the following:

IRS ALIGNING ON GNSS POS:	The IR alignment is in progress, and the reference position for the IRs alignment is the GNSS position.
IRS ALIGNED ON GNSS POS:	The IRs are aligned on the GNSS position.
IRS ALIGNING ON REF POS:	The IR alignment is in progress, and the reference position for the IR alignment is a position that is different from the GNSS position. The flight crew defines this reference position via the ALIGN ON OTHER REF function, that appears by clicking on the ALIGN ON OTHER REF button (*Refer to ALIGN ON OTHER REF Button*).
IRS ALIGNED ON REF POS:	The IRs are aligned on a reference position that is different from the GNSS position. The flight crew defines this reference position via the ALIGN ON OTHER REF function, that appears by clicking on the ALIGN ON OTHER REF button (*Refer to ALIGN ON OTHER REF Button*).

Ident.: DSC-22-FMS-20-20-20-290-00004187.0001001 / 14 APR 14

ALIGN ON OTHER REF BUTTON

When clicked, displays the ALIGN ON OTHER REF function (*Refer to ALIGN ON OTHER REF Function*).

L2 The flight crew can define the other reference position only in PREFLIGHT or DONE flight phase.

Ident.: DSC-22-FMS-20-20-20-290-00004188.0001001 / 14 APR 14

ALIGN ON OTHER REF FUNCTION

The ALIGN ON OTHER REF function enables the flight crew to define a reference position for the IR alignment.

L2 The flight crew uses the ALIGN ON OTHER REF function to define a reference position that is different from the GNSS position.

When clicked, closes the ALIGN ON OTHER REF function.

Ident.: DSC-22-FMS-20-20-20-290-00004190.0001001 / 22 APR 14

DEPARTURE AIRPORT IDENT

Indicates the ident of the departure airport.

L2 The ident of the departure airport is displayed, only when the values in the latitude and longitude entry fields are the latitude and longitude of the reference point of the departure airport .

Ident.: DSC-22-FMS-20-20-20-290-00004191.0001001 / 22 APR 14

LATITUDE AND LONGITUDE ENTRY FIELDS

The flight crew enters the latitude and longitude of the new reference position in the entry fields. The default position is the departure airport of the active flight plan, if the departure airport is entered.

ENTRY FORMAT

For the entry format of:
- Latitude, *Refer to DSC-22-FMS-20-80 LAT*
- Longitude, *Refer to DSC-22-FMS-20-80 LONG*.

Ident.: DSC-22-FMS-20-20-20-290-00004192.0001001 / 14 APR 14

ALIGN IRS BUTTON

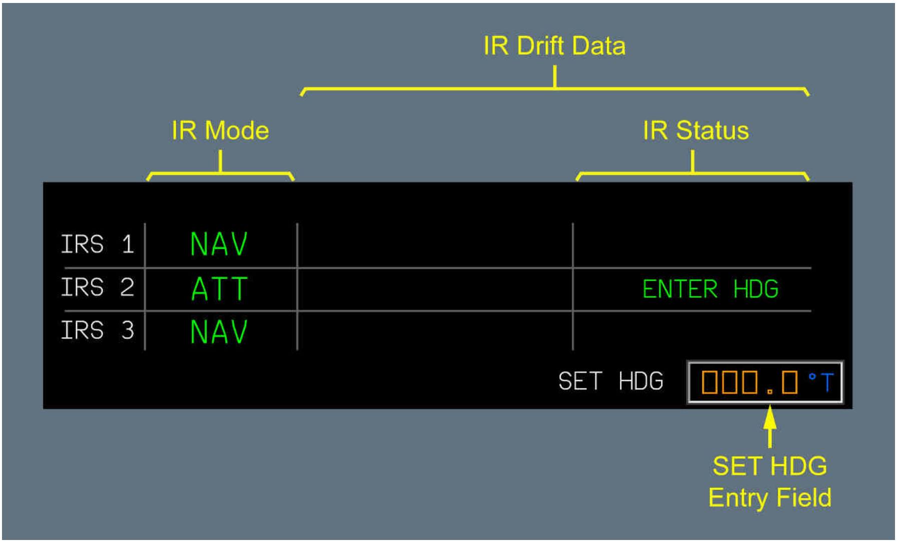
When clicked, sends the new reference position to the ADIRS, for IR alignment.

Ident.: DSC-22-FMS-20-20-20-290-00004193.0001001 / 22 APR 14

IR TABLE

For each IR, the IR table displays:
- In the first column: The IR identification
- In the second column: The IR mode
- In the fourth column: The IR status
- In the third and fourth columns (when the DONE flight phase is active): The IR drift data.

IR Table



IR Drift Data
IR Mode
IR Status
SET HDG
Entry Field

IRS 1	NAV		
IRS 2	ATT		ENTER HDG
IRS 3	NAV		

SET HDG □□□.□°T

Ident.: DSC-22-FMS-20-20-20-290-00004194.0001001 / 22 APR 14

IR MODE

The second column of the IR table displays the IR mode.
The IR mode is one of the following:

NAV

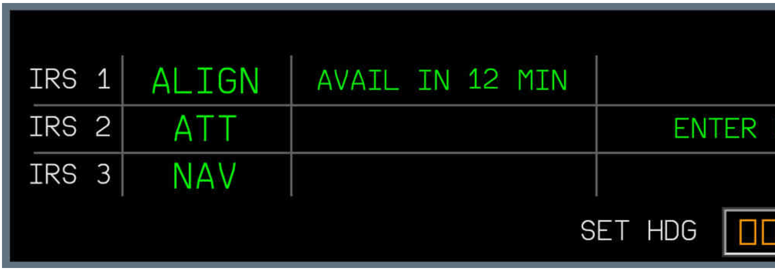
The IR is in NAV mode. The NAV mode is the normal mode.

When the three IRs are in NAV mode and the DONE flight phase is not active, the second column of the IR table displays the IR deviation from the aircraft position:
- On the MFD of the Captain, the IR table displays the deviation from POS 1
- On the MFD of the First Officer, the IR table displays the deviation from POS 2.

		DEVIATION FROM POS1
IRS 1	NAV	1.4 NM
IRS 2	NAV	0.9 NM
IRS 3	NAV	0.2 NM

ALIGN

The IR waits for an alignment reference position, or the IR alignment is in progress.
When the IR alignment is in progress, the second column of the table displays the estimated time to complete the IR alignment.



IRS 1	ALIGN	AVAIL IN 12 MIN	
IRS 2	ATT		ENTER
IRS 3	NAV		

SET HDG □□

ATT

The IR is in ATT mode.
When one of the three IR is in ATT mode, the IR status is ENTER HDG, and the SET HDG entry field is displayed below the IR table (*Refer to SET HDG Entry Field*).

INVALID

The IR is not valid.

Ident.: DSC-22-FMS-20-20-20-290-00004196.0001001 / 30 APR 14

IR STATUS

The fourth column of the IR table displays the IR status:

- There is no display, when the status is normal
- IR FAULT
- DELAYED MAINT
- ENTER P.POS
- SELECT ATT
- EXCESS MOTION
- SWITCH ADR
- CHECK C/B
- ENTER HDG
  When the IR status is ENTER HDG, the SET HDG entry field is displayed below the IR table (*Refer to SET HDG Entry Field*).
- REENTER P.POS
- SYS BELOW -15°.

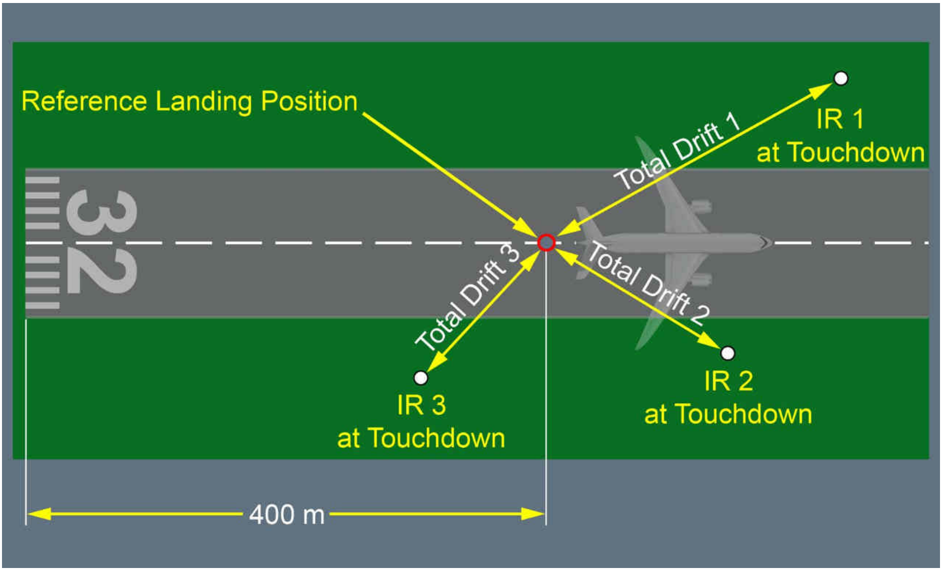
IR DRIFT DATA

When the DONE flight phase is active, the IR table displays:

- In the third column: The average drift of the IR

L2 At the end of the flight, each FMC computes an average drift for each IR position.
Average drift = Total drift / Time since last alignment.
The total drift is the difference between the IR position at landing and the reference landing position. The reference landing position is the position of the destination runway threshold, plus a shift of 400 m on the runway axis.

Total Drift



Reference Landing Position
Total Drift 1
IR 1
at Touchdown
32
Total Drift 3
Total Drift 2
IR 3
at Touchdown
IR 2
at Touchdown
400 m

L1 - In the fourth column: The current ground speed.

		DRIFT AT LFB032L	GND SPD
IRS 1	NAV	1.0 NM/H	12 KT
IRS 2	NAV	11.0 NM/H	12 KT
IRS 3	NAV	1.0 NM/H	12 KT

IR Drift Data

Ident.: DSC-22-FMS-20-20-20-290-00004197.0001001 / 22 APR 14

SET HDG ENTRY FIELD

The flight crew enters the heading in the entry field.
The entered heading initializes the IR in ATT mode.
The SET HDG entry field is displayed, only if one or more IRs are in ATT mode.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 HEADING (SET HDG).

Ident.: DSC-22-FMS-20-20-20-290-00004198.0001001 / 22 APR 14

IRS1(2)(3) BUTTON

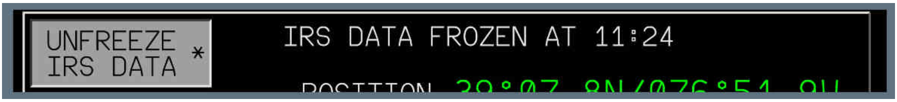
When clicked, displays the IRS1(2)(3) panel (*Refer to IRS1(2)(3) Panel*).
When clicked again, removes the IRS1(2)(3) panel from display.

Ident.: DSC-22-FMS-20-20-20-290-00004199.0001001 / 22 APR 14

FREEZE IRS DATA BUTTON

When clicked, freezes the display of all IR data on the IRS1, IRS2, and IRS3 panels.

After the flight crew clicks on the FREEZE IRS DATA button:
- The IRS DATA FROZEN AT HH:MM label appears next to the FREEZE IRS DATA button
  The "HH:MM" corresponds to the UTC(flight) time at which the IR data was frozen.
- The label of the FREEZE IRS DATA button becomes UNFREEZE IRS DATA.
  When clicked, the IR data is no longer frozen.



IRS DATA FROZEN AT 11:24

UNFREEZE IRS DATA Button

Ident.: DSC-22-FMS-20-20-20-290-00004200.0001001 / 28 APR 17

IRS1(2)(3) PANEL

Displays the following IR 1(2)(3) data:

- Position latitude/longitude
- True track
- Ground speed
- True wind
- True heading
- Magnetic heading
  Dashes appear instead of the magnetic heading, when the aircraft is at extreme latitudes.
- Magnetic variation
  The magnetic variation is the difference between the IR true heading and the IR magnetic heading.
- GPIRS position
- GPIRS position accuracy
  L2 The GPIRS position accuracy is the horizontal figure of merit of the GPIRS position.

When the IR 1(2)(3) is in ATT mode:

- The following data of the IRS1(2)(3) panel is not available:
  - Position latitude/longitude
    Dashes appear instead of the position latitude/longitude.
  - True track
    Dashes appear instead of the true tack.
- The magnetic variation is equal to 0
  Therefore, the magnetic heading is equal to the true heading.
- The other data of the IRS1(2)(3) panel is available, as long as the GPS is valid.

Ident.: DSC-22-FMS-20-20-20-290-00004201.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays:

- The ACTIVE/INIT page (*Refer to page*), if the ACTIVE/INIT page is the page that was displayed before the POSITION/IRS page
- The POSITION/MONITOR page (*Refer to page*), if the POSITION/MONITOR page is the page that was displayed before the POSITION/IRS page.

L2 The RETURN button appears, only if the flight crew accesses the POSITION/IRS page via the ACTIVE/INIT page or POSITION/MONITOR page.

PURPOSE

On the POSITION/MONITOR page, the flight crew can:
- Monitor the navigation accuracy
- Monitor the aircraft, GNSS, IR, and radio positions

- Manually update the aircraft position
- Compute the bearing and distance from the present position of the aircraft to a specific location (e.g. a waypoint, navaid, or runway).

Via the POSITION/MONITOR page, the flight crew can access:
- The POSITION/NAVAIDS page, for more information about the radio position
- The POSITION/GNSS page, for more information about the GNSS positions
- The POSITION/IRS page, for more information about the IR positions.

LINKS

For information about:
- Navigation accuracy, the RNP, and the EPU, *Refer to DSC-34-NAV-20-10-60 Position Accuracy and Navigation Accuracy*
- The aircraft, GNSS, IR, and radio positions, *Refer to DSC-34-NAV-20-10-60 Position Computation*
- The navigation modes, *Refer to DSC-34-NAV-20-10-60 Navigation Modes*.

Ident.: DSC-22-FMS-20-20-20-300-00004203.0001001 / 14 APR 14

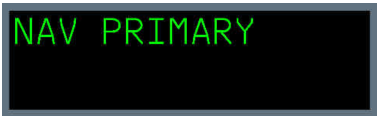
NAVIGATION STATUS AND NAVIGATION ACCURACY

Indicate the navigation status and the navigation accuracy.

The navigation status can be one of the following:

- NAV PRIMARY
  When the navigation status is NAV PRIMARY, the navigation accuracy does not appear.

NAV PRIMARY

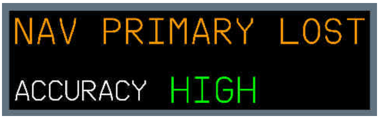


NAV PRIMARY

- NAV PRIMARY LOST.
  When the navigation status is NAV PRIMARY LOST, the navigation accuracy appears below the NAV PRIMARY LOST label.

  The navigation accuracy can be either:
  - HIGH, or

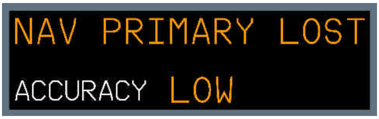
NAV PRIMARY LOST - HIGH



NAV PRIMARY LOST
ACCURACY HIGH

  - LOW.

NAV PRIMARY LOST - LOW



NAV PRIMARY LOST
ACCURACY LOW

Ident.: DSC-22-FMS-20-20-20-300-00004207.0001001 / 22 APR 14

RNP ENTRY FIELD

Indicates the Required Navigation Performance (RNP).
There is a default RNP value that depends on the flight area. The default value is displayed in small font.
The flight crew can always overwrite the default value. The RNP value that the flight crew enters is displayed in large font.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 RNP.

Ident.: DSC-22-FMS-20-20-20-300-00004206.0001001 / 22 APR 14

EPU

Indicates the Estimated Position Uncertainty (EPU).

Ident.: DSC-22-FMS-20-20-20-300-00004208.0001001 / 22 APR 14

POS1 AND POS2

Indicate the latitude/longitude of POS 1 and POS 2:
- POS 1 is the aircraft position that FMS 1 uses
- POS 2 is the aircraft position that FMS 2 uses.

The ADIRS computes the aircraft position, and sends the aircraft position to the FMS.
L2 ADIRU 1 computes POS 1, and sends POS 1 to FMS 1.
ADIRU 2 computes POS 2, and sends POS 2 to FMS 2.

Ident.: DSC-22-FMS-20-20-20-300-00004209.0001001 / 22 APR 14

NAVIGATION MODES

Indicate:
- The navigation mode that is used to compute POS 1
- The navigation mode that is used to compute POS 2.

The navigation mode can be one of the following:
- IRS/GPS
- IRS/DME/DME
- IRS/VOR/DME
- IRS/LOC
- IRS/DME/LOC
- IRS/VOR/LOC
- IRS.

Ident.: DSC-22-FMS-20-20-20-300-00004212.0001001 / 24 APR 14

GPS DESELECTED LABEL

Indicates that the GPS source is not selected for the aircraft position computation.
The GPS DESELECTED label appears, if the flight crew deselected the GPS source via the GPS option list on the POSITION/GNSS page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-300-00004213.0001001 / 22 APR 14

IR DEVIATIONS

Indicate the deviation of IR 1, IR 2 and IR 3 from the aircraft position:

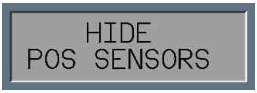
- Deviation from POS 1 on the MFD of the Captain
- Deviation from POS 2 on the MFD of the First Officer.

Ident.: DSC-22-FMS-20-20-20-300-00004211.0001001 / 22 APR 14

DISPLAY POS SENSORS BUTTON

When clicked, displays the GNSS, IR, and radio positions (*Refer to GNSS, IRS, and Radio Positions*).
The label of the DISPLAY POS SENSORS button becomes HIDE POS SENSORS, as soon as the GNSS, IR, and radio positions appear.

HIDE POS SENSORS Button



When clicked, removes the GNSS, IR, and radio positions from display.

Ident.: DSC-22-FMS-20-20-20-300-00004214.0001001 / 22 APR 14

GNSS, IR, AND RADIO POSITIONS

By default, the GNSS, IR, and radio positions are not displayed on the POSITION/MONITOR page.

The GNSS, IR, and radio positions appears on the POSITION/MONITOR page:

- If the flight crew clicks on the DISPLAY POS SENSORS button (*Refer to DISPLAY POS SENSORS*), or
- After the flight crew clicks on the FREEZE POS DATA button (*Refer to FREEZE POS DATA Button*).

- The latitude/longitude of the IR 1 position
- The latitude/longitude of the IR 2 position
- The latitude/longitude of the IR 3 position.

The ADIRS sends the IR positions to the FMS.

Ident.: DSC-22-FMS-20-20-20-300-00004210.0001001 / 22 APR 14

RADIO

Indicates the latitude/longitude of the radio position that is computed by the onside FMS.

Ident.: DSC-22-FMS-20-20-20-300-00004217.0001001 / 22 APR 14

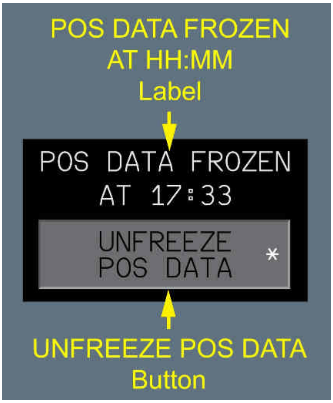
FREEZE POS DATA BUTTON

When clicked, freezes the display of all position data on the onside POSITION/MONITOR page.

After the flight crew clicks on the FREEZE POS DATA button:
- The GNSS, IR, and radio positions automatically appear on the POSITION/MONITOR page, if the flight crew did not previously display this data via the DISPLAY POS SENSORS button (*Refer to DISPLAY POS SENSORS Button*)
- The POS DATA FROZEN AT HH:MM label appears above the FREEZE POS DATA button The "HH:MM" corresponds to the UTC(flight) time at which all of the position data was frozen.
- The label of the FREEZE POS DATA button becomes UNFREEZE POS DATA.

When clicked:
- The position data is no longer frozen
- The GNSS, IR, and radio positions are automatically removed from display, if this data was not displayed before the flight crew clicks on the FREEZE POS DATA button.

Frozen Position Data



Note: *The position data is automatically no longer frozen, if one of the following occurs:*
- *The flight crew manually removes the GNSS, IR, and radio positions from display via the HIDE POS SENSORS button (Refer to DISPLAY POS SENSORS Button)*
- *The flight crew displays another FMS page.*

Ident.: DSC-22-FMS-20-20-20-300-00004218.0001001 / 22 APR 14

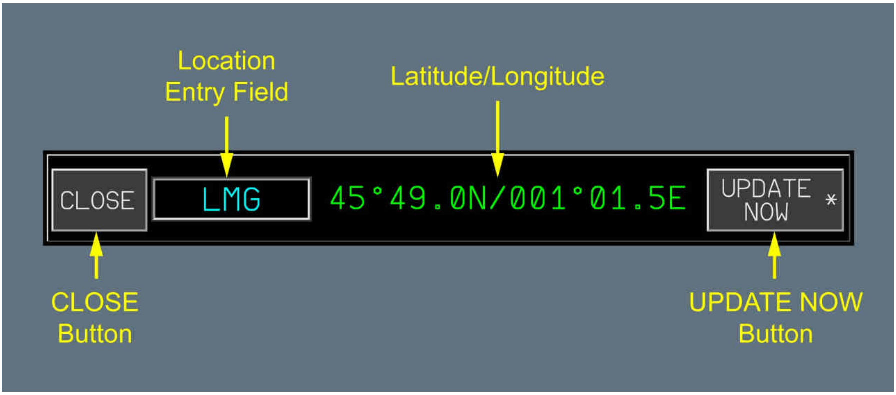
POSITION UPDATE BUTTON

When clicked, displays the POSITION UPDATE function (*Refer to POSITION UPDATE Function*). The POSITION UPDATE button is available, only when the navigation mode is not IRS/GNSS (*Refer to Navigation Modes*).

Ident.: DSC-22-FMS-20-20-20-300-00004219.0001001 / 22 APR 14

POSITION UPDATE FUNCTION

POSITION UPDATE Function



Note: The POSITION UPDATE function automatically closes, if the navigation mode becomes IRS/GNSS (Refer to Navigation Modes).

CLOSE BUTTON

When clicked, closes the POSITION UPDATE function.

LOCATION ENTRY FIELD

The flight crew enters the location at which the position update will be performed.

The location can be:
- One of the following elements of the navigation database or pilot-stored elements database:
  - Waypoint
  - Navaid
  - Airport
  - Runway
- A latitude/longitude

- A place/bearing/distance
- A place-bearing/place-bearing.

After the flight crew enters a valid latitude/longitude, place/bearing/distance, or place-bearing/place-bearing, the entry field displays ENTRY.

Entry Format

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Navaid, *Refer to DSC-22-FMS-20-80 AIRPORT (ARPT)*
- Airport, *Refer to DSC-22-FMS-20-80 NAVAID IDENT*
- Runway, *Refer to DSC-22-FMS-20-80 RWY IDENT*
- Latitude/longitude, *Refer to DSC-22-FMS-20-80 LAT/LONG*
- Place/bearing/distance, *Refer to DSC-22-FMS-20-80 PLACE/BEARING/DISTANCE (PBD)*
- Place-bearing/place-bearing, *Refer to DSC-22-FMS-20-80 PLACE-BEARING/PLACE-BEARING (PB/PB)*.

LATITUDE/LONGITUDE

Indicates the latitude/longitude of the location at which the position update will be performed.

UPDATE NOW BUTTON

When clicked, updates the aircraft position with the position of the location that was entered in the location entry field (See Location Entry Field).
The flight crew clicks on the UPDATE NOW button, when the aircraft overflies this location.

Ident.: DSC-22-FMS-20-20-20-300-00004220.0001001 / 14 APR 14

BRG / DIST TO FUNCTION

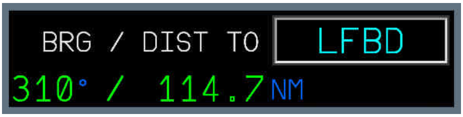
The flight crew enters a location in the BRG / DIST TO entry field in order to compute the bearing and the distance from the aircraft present position to the entered location.

The location can be:
- One of the following elements of the navigation database or pilot-stored elements database:
  - Waypoint
  - Navaid
  - Airport
  - Runway.
- A latitude/longitude
- A place/bearing/distance
- A place-bearing/place-bearing.

After the flight crew enters a valid latitude/longitude, place/bearing/distance, or place-bearing/place-bearing, the BRG / DIST TO entry field displays ENTRY.

The FMS displays the result of the computation just below the BRG / DIST TO entry field.

BRG / DIST TO Function



BRG / DIST TO LFBD
310° / 114.7 NM

ENTRY FORMAT

For the entry format of:
- Waypoint, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Navaid, *Refer to DSC-22-FMS-20-80 AIRPORT (ARPT)*
- Airport, *Refer to DSC-22-FMS-20-80 NAVAID IDENT*
- Runway, *Refer to DSC-22-FMS-20-80 RWY IDENT*
- Latitude/longitude, *Refer to DSC-22-FMS-20-80 LAT/LONG*
- Place/bearing/distance, *Refer to DSC-22-FMS-20-80 PLACE/BEARING/DISTANCE (PBD)*
- Place-bearing/place-bearing, *Refer to DSC-22-FMS-20-80 PLACE-BEARING/PLACE-BEARING (PB/PB)*.

Ident.: DSC-22-FMS-20-20-20-300-00004221.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the ACTIVE/PERF page (*Refer to page*).

L2 The RETURN button appears, only if the flight crew accesses the POSITION/MONITOR page via the ACTIVE/PERF page.

Ident.: DSC-22-FMS-20-20-20-300-00004222.0001001 / 22 APR 14

NAVAIDS BUTTON

When clicked, displays the POSITION/NAVAIDS page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-300-00004223.0001001 / 22 APR 14

GNSS BUTTON

When clicked, displays the POSITION/ GNSS page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-300-00004224.0001001 / 22 APR 14

IRS BUTTON

When clicked, displays the POSITION/IRS page (*Refer to page*).

PURPOSE

On the TUNED FOR DISPLAY panel of the POSITION/NAVAIDS page, the flight crew can tune the VORs ◁ and the ADFs ◁ in order to display the VOR ◁ and ADF ◁ data on the ND.

On the SELECTED FOR NAV panel of the POSITION/NAVAIDS page, the flight crew can:
- Check the navaids that are automatically tuned to compute the radio position
- Check the radio position and the radio navigation mode
- Deselect a navaid.

On the lower part of the POSITION/NAVAIDS page, the flight crew can tune the landing system.

Note: *When the STBY RAD NAV mode of the RMP is active, all entry fields on the POSITION/NAVAIDS page are automatically cleared, and the flight crew cannot enter any data.*

LINKS

For information about:
- Radio navigation tuning, *Refer to DSC-22-FMS-10-30-20 Description*
- The radio position, *Refer to DSC-34-NAV-20-10-60 Position Computation*.

Ident.: DSC-22-FMS-20-20-20-310-00004226.0001001 / 14 APR 14

ACCESS

The flight crew can access the POSITION/NAVAIDS page via:

- The KCCU, by pressing the NAVAID key
  The TUNED FOR DISPLAY panel opens by default.

VOR 1(2) IDENT ENTRY FIELD

Indicates the ident of the VOR 1(2) that is tuned for display on the ND.
In normal operation, FMS 1 tunes VOR 1, and FMS 2 tunes VOR 2 ◁ .
The ident of a VOR that the FMS automatically selects is displayed in small font.
The flight crew can always overwrite the ident of a VOR that the FMS automatically selected. The ident of a VOR that the flight crew enters is displayed in large font.

Note: *If the flight crew enters the ident of a navaid that was deselected, the FMS message area displays the XXX IS DESELECTED message (Refer to message).*

To revert to automatic VOR 1(2) selection, the flight crew clears the VOR 1(2) IDENT entry field.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 NAVAID IDENT.

L12

Note: *If the format is correct but the entered navaid is not in the navigation database, the PILOT STORED NAVAIDS panel of the DATA/NAVAID page appears. Via the PILOT STORED NAVAIDS panel, the flight crew can add the entered navaid to the pilot-stored elements database.*
For more information about the DATA/NAVAID page, Refer to DSC-22-FMS-20-20-20 DATA/NAVAID Page.
For information about the pilot-stored elements database, Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database.

Ident.: DSC-22-FMS-20-20-20-310-00004228.0002001 / 14 APR 16

VOR 1(2) FREQ ENTRY FIELD

Indicates the frequency of the VOR 1(2) that is tuned for display on the ND.
In normal operation, FMS 1 tunes VOR 1, and FMS 2 tunes VOR 2 ◁* .
The VOR 1(2) frequency is automatically entered, when the VOR 1(2) ident is entered in the VOR IDENT 1(2) entry field.
A frequency that the FMS automatically selects is displayed in small font.
The flight crew can always overwrite the frequency that the FMS automatically selected. A frequency that the flight crew enters is displayed in large font.

Note: *The flight crew should use the VOR ident instead of the VOR frequency to manually tune a navaid, unless the navaid is not in the database.*
If the flight crew manually enters a frequency in the VOR 1(2) FREQ entry field, the VOR IDENT 1(2) entry field is automatically cleared.

To revert to automatic VOR 1(2) selection, the flight crew clears the VOR FREQ 1(2) entry field.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 VOR FREQ.

Ident.: DSC-22-FMS-20-20-20-310-00004229.0002001 / 22 APR 14

VOR 1(2) CRS ENTRY FIELD

Indicates the course of the VOR 1(2) that is tuned for display on the ND.

The flight crew can enter a course, only if the navaid that is entered in the VOR IDENT 1(2) entry field is a VOR, VOR/DME, or VORTAC.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 VOR CRS.

Ident.: DSC-22-FMS-20-20-20-310-00004230.0002001 / 22 APR 14

VOR 1(2) CLASS

Indicates the class of the navaid that is entered in the VOR IDENT 1(2) entry field.

The class can be one of the following:
- VOR
- DME
- TACAN
- VOR/DME
- VORTAC.

Ident.: DSC-22-FMS-20-20-20-310-00004231.0002001 / 14 APR 16

ADF 1(2) IDENT ENTRY FIELD

Indicates the ident of the NDB 1(2) that is tuned for display on the ND.
In normal operation, FMS 1 tunes ADF 1, and FMS 2 tunes ADF 2.
The ident of an NDB that the FMS automatically selects is displayed in small font.
The flight crew can always overwrite an NDB that the FMS automatically selected. The ident of an NDB that the flight crew enters is displayed in large font.
To revert to automatic NDB 1(2) selection, the flight crew clears the ADF IDENT 1(2) entry field.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 NAVAID IDENT.

L12

Note: *If the format is correct but the entered navaid is not in the navigation database, the PILOT STORED NAVAIDS panel of the DATA/NAVAID page appears. Via the PILOT STORED NAVAIDS panel, the flight crew can add the entered navaid to the pilot-stored elements database.*
For more information about the DATA/NAVAID page, Refer to DSC-22-FMS-20-20-20 DATA/NAVAID Page.
For information about the pilot-stored elements database, Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database.

Ident.: DSC-22-FMS-20-20-20-310-00004232.0002001 / 14 APR 16

ADF 1(2) FREQ ENTRY FIELD ◁

Indicates the frequency of the NDB 1(2) that is tuned for display on the ND.
In normal operation, FMS 1 tunes ADF 1, and FMS 2 tunes ADF 2.
The NDB 1(2) frequency is automatically entered, when the NDB 1(2) ident is entered in the ADF 1(2) IDENT entry field.
A frequency that the FMS automatically selects is displayed in small font.
The flight crew can always overwrite the frequency that the FMS automatically selected. A frequency that the flight crew enters is displayed in large font.

Note: *The flight crew should use the NDB ident instead of the NDB frequency to manually tune a navaid, unless the navaid is not in the database.*
If the flight crew manually enters a frequency in the ADF 1(2) FREQ entry field, the ADF IDENT 1(2) entry field is automatically cleared.

To revert to automatic NDB 1(2) selection, the flight crew clears the ADF FREQ 1(2) entry field.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ADF FREQ.

Ident.: DSC-22-FMS-20-20-20-310-00004233.0001001 / 14 APR 16

BFO ◁

The flight crew selects(deselects) the BFO option to activate(deactivate) the Beat Frequency Oscillator (BFO).
By default, the BFO option is deselected.

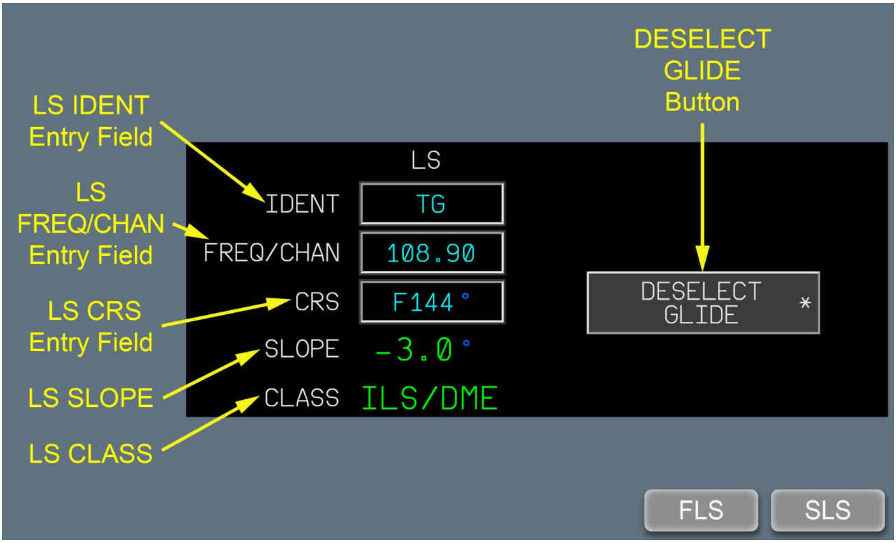
Ident.: DSC-22-FMS-20-20-20-310-00004204.0002001 / 14 APR 16

LS AREA

The layout of the LS area depends on the type of the approach, that the flight crew selected, with which the tuned landing system is associated.

In addition, the LS area displays specific buttons and labels, if the approach that the flight crew selected is:
- An ILS approach
- An approach that can be flown with the FLS function
- An approach that can be flown with the SLS ◁ function.

LS Area



LS

IDENT TG

FREQ/CHAN 108.90

SLOPE -3.0°

CLASS ILS/DME

Ident.: DSC-22-FMS-20-20-20-310-00004234.0002001 / 14 APR 16

LS IDENT ENTRY FIELD

Indicates the ident of the tuned landing system.

The ident of the tuned landing system is automatically entered, when the flight crew selects an approach, and this approach is:

- An ILS approach, or
- A GLS ◁ approach, or
- An approach that can be flown with the SLS ◁ function.

When the approach that the flight crew selected is an approach that can be flown with the FLS function, the LS IDENT entry field is empty.

L2 *Note:* *If the flight crew deselects the glide slope for an ILS approach, the approach can be flown with the LOC/FLS function. In this case, the LS IDENT entry field is not empty, and still indicates the ident of the tuned ILS.*

L1 The ident of a landing system that the FMS automatically selects is displayed in small font. The flight crew can always overwrite a landing system that the FMS automatically selected. The landing system ident that the flight crew enters is displayed in large font.

Note:
1. *If the flight crew enters the ident of a landing system that was deselected, the FMS message area displays the XXX IS DESELECTED message (Refer to message).*
2. *If the flight crew manually tunes a landing system that disagrees with the selected runway in the flight plan, the FMS message area displays the RUNWAY / LS DISAGREE message (Refer to message).*
3. *If the flight crew manually tunes a landing system that does not correspond to the approach that the flight crew selected in the flight plan, the FMS message area displays the CHECK APPR SEL message (Refer to message).*
4. *If the flight crew manually enters a landing system ident that corresponds to an approach that can be flown with the SLS ◁ function, the MFD displays the PILOT STORED NAVAIDS panel of the DATA/NAVAID page (Refer to page).*

L2 The ident of the tuned landing system is also automatically entered, when the frequency of the landing system, that is associated with the flight plan arrival (or departure) procedure, is entered in the LS FREQ/CHAN entry field.
To revert to the automatic selection of the landing system, the flight crew clears the LS IDENT entry field.

L1 ENTRY FORMAT

Refer to DSC-22-FMS-20-80 LS IDENT.

L12

Note: *If the format is correct but the entered landing system is not in the navigation database, the PILOT STORED NAVAIDS panel of the DATA/NAVAID page appears.*
Via the PILOT STORED NAVAIDS panel, the flight crew can add the entered landing system to the pilot-stored elements database.
For more information about the DATA/NAVAID page, Refer to DSC-22-FMS-20-20-20 DATA/NAVAID Page.
For information about the pilot-stored elements database, Refer to DSC-22-FMS-10-20 Pilot-Stored Elements Database.

Ident.: DSC-22-FMS-20-20-20-310-00004235.0002001 / 14 APR 16

LS FREQ/CHAN ENTRY FIELD

Indicates the frequency(channel) of the tuned landing system.
The frequency(channel) of the tuned landing system is automatically entered, when the ident of the landing system is entered in the LS IDENT entry field.
When the approach that the flight crew selected is an approach that can be flown with the FLS function, the LS FREQ/CHAN entry field is empty.

L2 *Note:* *If the flight crew deselects the glide slope for an ILS approach, the approach can be flown with the LOC/FLS function. In this case, the LS FREQ/CHAN entry field is not empty, and still indicates the frequency of the tuned ILS.*

L1 A frequency(channel) that the FMS automatically selects is displayed in small font.
The flight crew can overwrite a frequency(channel) that the FMS automatically selected. A frequency(channel) that the flight crew enters is displayed in large font.

Note: *1. The flight crew should use the ident of the landing system instead of the frequency(channel) of the landing system to manually tune the landing system, unless the landing system is not in the database.*
If the flight crew manually enters a frequency(channel) in the LS FREQ/CHAN entry field, and if this frequency(channel) is associated with a landing system that is in the navigation database, the ident of the tuned landing system is automatically entered in the LS IDENT entry field.
2. If the flight crew manually enters a landing system channel that corresponds to an approach that can be flown with the SLS ◁ function, the FMS message area displays the SLS MANUAL TUNING NOT ALLOWED message (Refer to message).

To revert to the automatic selection of the landing system, the flight crew clears the LS FREQ/CHAN entry field.

ENTRY FORMAT

For the entry format of:
- The landing system frequency, *Refer to DSC-22-FMS-20-80 LS FREQ*
- The GLS ◁ channel, *Refer to DSC-22-FMS-20-80 CHANNEL (GLS)*.

Ident.: DSC-22-FMS-20-20-20-310-00004236.0001001 / 22 APR 14

LS CRS ENTRY FIELD

Indicates the course of the tuned landing system.
The course of the tuned landing system may be automatically entered, when the landing system is tuned.
When the approach that the flight crew selected is an approach that can be flown with the FLS function, the LS CRS entry field is empty.

L2 *Note:* *If the flight crew deselects the glide slope for an ILS approach, the approach can be flown with the LOC/FLS function. In this case, the LS CRS entry field is not empty, and still indicates the course of the tuned ILS.*

L1 A course that the FMS automatically selects is displayed in small font.
The flight crew can always overwrite a course that the FMS automatically selects. A course that the flight crew enters is displayed in large font.

To revert to automatic course selection, the flight crew clears the LS CRS entry field.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 LS CRS.

Ident.: DSC-22-FMS-20-20-20-310-00013892.0001001 / 22 APR 14

LS CRS

Indicates the course of the tuned landing system.

Ident.: DSC-22-FMS-20-20-20-310-00004237.0001001 / 22 APR 14

LS SLOPE

Indicates the slope of the tuned landing system.

L2 LS SLOPE is displayed, only if there is a slope that is associated with the tuned landing system.

Ident.: DSC-22-FMS-20-20-20-310-00004238.0002001 / 14 APR 16

LS CLASS

Indicates the class of the tuned landing system.

The class can be one of the following:
- ILS
- ILS/DME
- ILS/TACAN
- GLS ◁
- SLS ◁ .

L2 LS CLASS is displayed, only if there is a class that corresponds to the tuned landing system.

Ident.: DSC-22-FMS-20-20-20-310-00004239.0001001 / 03 AUG 16

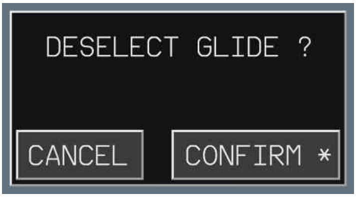
DESELECT GLIDE BUTTON

The DESELECT GLIDE button is displayed, only if all of the following apply:
- The approach that the flight crew selected is an ILS approach
- The tuned landing system is the ILS that is associated with the approach that the flight crew selected.

L2 In addition, the following options must be selected by the operator to enable the display of the DESELECT GLIDE button:
- The FLS option
  The activation of the FLS option enables the use of the FLS function.
- The MIX LOC/VNAV option.
  The activation of the MIX LOC/VNAV option enables the use of the LOC/FLS function.

L1 When clicked, deselects the use of the glide slope data during the ILS approach.

The flight crew must perform a confirmation action.



Confirmation Window

The partial loss or the maintenance of the ILS ground station may require the flight crew to deselect the glide slope data.
When the flight crew deselects the glide slope data, the approach can be flown in LOC/F-G/S guidance modes.

After the flight crew clicks on the DESELECT GLIDE button:
- The label of the DESELECT GLIDE button becomes SELECT GLIDE
- The GLIDE DESELECTED label appears above the SELECT GLIDE button, when:
  - The LOC mode is armed, or
  - The LOC*, LOC, or LAND mode is engaged.

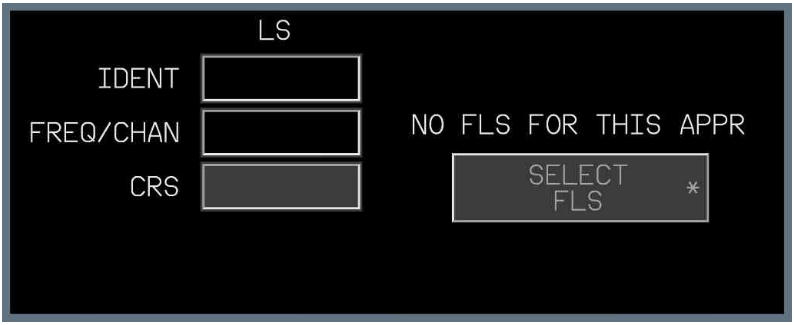
- *The approach that the flight crew selected is an approach that can be flown with the FLS function, and the FLS function is not available*
- *The approach that the flight crew selected is an RNAV (RNP) approach.*

In both above-listed cases, the approach cannot be flown in F-LOC/F-G/S guidance modes. The NO FLS FOR THIS APPR label appears above the SELECT FLS button, as a reminder. The approach can be flown in NAV/APP-DES guidance modes.

NO FLS FOR THIS APPR Label



In addition, if the approach that the flight crew selected is an approach that can be flown with the FLS function and the FLS function is not available, the FMS message area displays the NO FLS FOR THIS APPR message (Refer to message).

Ident.: DSC-22-FMS-20-20-20-310-00013795.0001001 / 14 APR 16

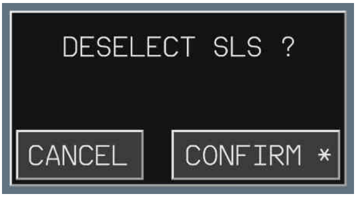
DESELECT SLS ◁ BUTTON

The DESELECT SLS button is displayed, only if all of the following apply:

- The approach that the flight crew selected is an RNAV (GNSS) approach with LPV minima
- The tuned landing system is the SLS.

When clicked, deselects the use of the SLS function to fly the approach.
The flight crew must perform a confirmation action.

Confirmation Window



DESELECT SLS ?
CANCEL
CONFIRM *

When the flight crew deselects the SLS function, the approach can be flown with the FLS function (i.e. in F-LOC/F-G/S guidance modes).

After the flight crew clicks on the DESELECT SLS button:
- The label of the DESELECT SLS button becomes SELECT SLS
- The SLS DESELECTED LNAV/VNAV OR LNAV MINIMA label appears above the SELECT SLS button.

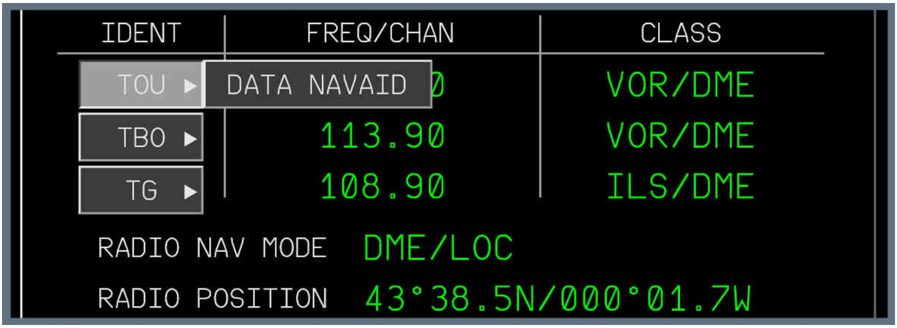
CONFIRM *

Ident.: DSC-22-FMS-20-20-20-310-00004240.0001001 / 22 APR 14

IDENT

Indicates the idents of the navaids that are used for the radio position computation.
When the flight crew clicks on a navaid ident button, the navaid ident menu appears.

Navaid Ident Menu



IDENT	FREQ/CHAN	CLASS
TOU ▶ DATA NAVAID	0	VOR/DME
TBO ▶	113.90	VOR/DME
TG ▶	108.90	ILS/DME

RADIO NAV MODE DME/LOC

RADIO POSITION 43°38.5N/000°01.7W

The navaid ident menu has one option: DATA NAVAID. When selected, opens the DATABASE NAVAIDS panel of DATA/NAVAID page (*Refer to page*).

Note: *If a landing system is defined, the landing system is displayed in the third row of the table, even if the landing system is not used for the radio position computation.*

Ident.: DSC-22-FMS-20-20-20-310-00004241.0001001 / 22 APR 14

FREQ/CHAN

Indicates the frequency of the navaids that are automatically tuned for the radio position computation.

Ident.: DSC-22-FMS-20-20-20-310-00004242.0001001 / 14 APR 14

CLASS

Indicates the class of the navaids that are used for the radio position computation.

The class can be one of the following:
- VOR/DME
- VORTAC
- DME
- TACAN
- ILS
- ILS/DME
- ILS/TACAN.

Ident.: DSC-22-FMS-20-20-20-310-00004243.0001001 / 22 APR 14

RADIO NAV MODE

Indicates the radio navigation mode. The radio navigation mode indicates the combination of navaid types that are used to compute the radio position.

The radio navigation mode can be one of the following:
- DME/DME
- VOR/DME
- DME/LOC
  The DME/LOC mode corresponds to the following combination: DME/DME and LOC.
- VOR/LOC
  The VOR/LOC mode corresponds to the following combination: VOR/DME and LOC.
- LOC.

Ident.: DSC-22-FMS-20-20-20-310-00004244.0001001 / 22 APR 14

RADIO POSITION

Indicates latitude/longitude of the radio position.

Ident.: DSC-22-FMS-20-20-20-310-00004245.0001001 / 22 APR 14

LIST OF DESELECTED NAVAIDS

Indicates the list of the deselected navaids.
The flight crew deselects a navaid by entering the navaid ident in one of the 6 entry fields.
When deselected, the navaid can no longer be tuned for radio position computation or for display on the ND.

A navaid is reselected:
- Manually, by clearing the corresponding entry field
- Automatically, when one of the following occurs:
  - The DONE or PREFLIGHT flight phase becomes active
  - The navigation database changes.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 NAVAID IDENT.

Ident.: DSC-22-FMS-20-20-20-310-00004247.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays:
- The ACTIVE/INIT page (*Refer to page*), if the ACTIVE/INIT page is the page that was displayed before the POSITION/NAVAIDS page
- The POSITION/MONITOR page (*Refer to page*), if the POSITION/MONITOR page is the page that was displayed before the POSITION/INAVAIDS page.

L2 The RETURN button only appears if the flight crew accesses the POSITION/NAVAIDS page via the ACTIVE/INIT page or POSITION/MONITOR page.

PURPOSE

The POSITION/REPORT page enables the flight crew to check and send the position report.

The position report contains recorded and predicted data that is related to:
- The last sequenced waypoint
- The TO waypoint
- The NEXT waypoint
- The next cruise vertical profile change
- The destination airport.

MSG LIST

Ident.: DSC-22-FMS-20-20-20-320-00004250.0001001 / 22 APR 14

POSITION, ESTIMATING, AND NEXT

Display the following data:

- POSITION: Displays the UTC(flight) time and altitude that were recorded at the last sequenced reported-waypoint

L2 The last sequenced reported-waypoint is the last navigation database waypoint, or last PBD waypoint, or last LAT/LONG waypoint, that was sequenced.

L1
- ESTIMATING: Displays the UTC(flight) time of arrival and altitude that are predicted for the first next reported-waypoint that will be sequenced

L2 The first next reported-waypoint is a navigation database waypoint, or a PBD waypoint, or a LAT/LONG waypoint.

L1
- NEXT: Displays the UTC(flight) time of arrival and altitude that are predicted for the second next reported-waypoint that will be sequenced.

L2 The second next reported-waypoint is a navigation database waypoint, or a PBD waypoint, or a LAT/LONG waypoint.

L1 The UTC(TIME) label indicates the time reference:

- The UTC label indicates that the time reference is the UTC time
- The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:

- In the PREFLIGHT flight phase:
  - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - If the UTC time is valid, the time reference is the UTC time
  - If the UTC time is not valid, the time reference is the flight time.

Note: *Only navigation database waypoints, PBD waypoints, and LAT/LONG waypoints are reported. Therefore:*

- *The last sequenced reported-waypoint will not be identical to the FROM waypoint of the flight plan, if the FROM waypoint is not a navigation database waypoint, a PBD waypoint, or a LAT/LONG waypoint*
- *The first next reported-waypoint will not be identical to the TO waypoint of the flight plan, if the TO waypoint is not a navigation database waypoint, a PBD waypoint, or a LAT/LONG waypoint*
- *The second next reported-waypoint will not be identical to the NEXT waypoint of the flight plan, if the NEXT waypoint is not a navigation database waypoint, a PBD waypoint, or a LAT/LONG waypoint.*

Ident.: DSC-22-FMS-20-20-20-320-00004251.0001001 / 22 APR 14

SAT, T.WIND, AND FOB

Display the following data that was recorded at the last sequenced waypoint:

- Static Air Temperature (SAT)
- True Wind (T.WIND) direction and speed
- Fuel On Board (FOB).
  The FQMS provides the FOB.

Ident.: DSC-22-FMS-20-20-20-320-00004252.0001001 / 22 APR 14

NEXT CRZ PROFILE CHANGE AREA

When the CRUISE flight phase is active and there is a predicted profile change, displays the following data for the next vertical profile change:

- The type of vertical change

  The type can be one of the following:
  - Start of Climb (S/C)
  - Start of Descent (S/D)
  - Top of Descent (T/D).
- The start waypoint
- The target altitude (or current altitude)
- The predicted time of arrival, in UTC(flight) time, at the start waypoint

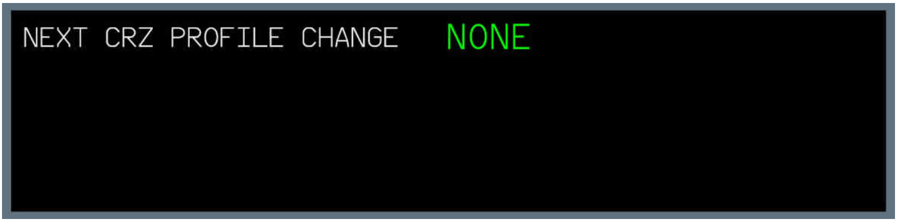
  The UTC(TIME) label indicates the time reference:
  - The UTC label indicates that the time reference is the UTC time
  - The TIME label indicates that the time reference is the flight time.

  L2 The time reference is defined as follows:
  - In the PREFLIGHT flight phase:
    - ■ If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
    - ■ If there is no entered ETT, the time reference is the flight time

    The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
  - In flight:
    - ■ If the UTC time is valid, the time reference is the UTC time
    - ■ If the UTC time is not valid, the time reference is the flight time.
- L1 The distance to the start waypoint, along the flight plan.

When the active flight phase is not CRUISE, or when there is no predicted profile change, the NONE label is displayed instead of the data.

NONE Label



NEXT CRZ PROFILE CHANGE NONE

Ident.: DSC-22-FMS-20-20-20-320-00004253.0001001 / 22 APR 14

DEST AREA

Displays the following data for the destination airport:

- The predicted time of arrival, in UTC(flight) time, at the destination airport

  The UTC(TIME) label indicates the time reference:
  - The UTC label indicates that the time reference is the UTC time
  - The TIME label indicates that the time reference is the flight time.

  L2 The time reference is defined as follows:
  - In the PREFLIGHT flight phase:
    - ■ If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
    - ■ If there is no entered ETT, the time reference is the flight time

    The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
  - In flight:
    - ■ If the UTC time is valid, the time reference is the UTC time
    - ■ If the UTC time is not valid, the time reference is the flight time.
- L1 The distance, along the flight plan, to the destination airport
- The Estimated Fuel On Board (EFOB) at the destination airport.

Ident.: DSC-22-FMS-20-20-20-320-00004254.0001001 / 22 APR 14

FREE TEXT ENTRY FIELD

The flight crew can enter a free text of up to 24 characters in the entry field. The free text is sent with the position report to the company ground station.
If the free text AMI option is not activated, the FREE TEXT entry field is not displayed.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 FREE TEXT.

PURPOSE

On the POSITION/TIME page, the flight crew can:

- Display and set the aircraft time reference (date and UTC time)
- Select the optional time data that the flight crew want to display on the permanent data

- Define up to three time markers
- Display local time data for up to two airports.

The POSITION/TIME page is available for the active flight plan only.

Ident.: DSC-22-FMS-20-20-20-330-00013516.0001001 / 22 APR 14

UTC

Indicates the UTC time.
The UTC time is also displayed on the permanent data.
The ADIRS provides the UTC time.

The flight crew can manually set the UTC time. In order to manually set the UTC time, the flight crew displays the UTC entry field, via the selection of the MANUAL option in the ACFT TIME REF option list (*Refer to ACFT TIME REF Option List*).

Ident.: DSC-22-FMS-20-20-20-330-00013517.0001001 / 22 APR 14

DATE

Indicates the date.
The date can also be displayed on the permanent data, depending on the option that is selected in the PERM DATA SETUP list (*Refer to PERM DATA SETUP List*).
The ADIRS provides the date.
The flight crew can manually set the date. In order to manually set the date, the flight crew displays the DATE entry field, via the selection of the MANUAL option in the ACFT TIME REF option list (*Refer to ACFT TIME REF Option List*).

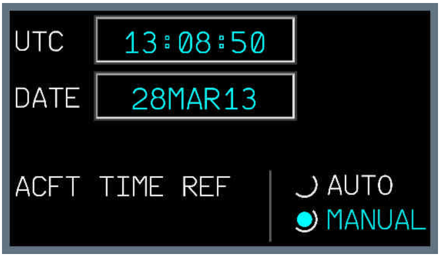
Ident.: DSC-22-FMS-20-20-20-330-00013518.0001001 / 14 APR 14

ACFT TIME REF OPTION LIST

The flight crew uses the ACFT TIME REF option list to select the aircraft time reference.

The ACFT TIME REF option list has the following options:
- AUTO: The ADIRS provides the aircraft time reference (date and UTC time)
  The AUTO option is automatically selected by default.
- MANUAL: The flight crew manually sets the aircraft time reference (date and UTC time).
  When selected, displays the UTC and DATE entry fields.

UTC and DATE Entry Fields



UTC 13:08:50
DATE 28MAR13
ACFT TIME REF
○ AUTO
● MANUAL

In the UTC(DATE) entry field, the data is displayed:
- In small blue font, when this data results from the ADIRS computation
- In large blue font, when the flight crew manually enters this data.
  As soon as the ADIRS uses the manually-entered value to initialize the computation of the time(date), the UTC(DATE) entry field displays the data in small blue font again.

L2 When the ADIRS is not available, the ACFT TIME REF option list disappears, and the flight crew cannot manually set the aircraft time reference.

L1 ENTRY FORMAT

For the entry format of:
- UTC time, *Refer to DSC-22-FMS-20-80 UTC*
- Date, *Refer to DSC-22-FMS-20-80 DATE*.

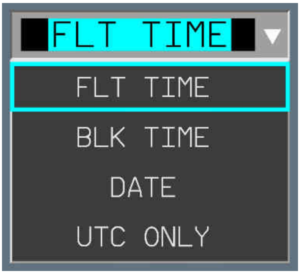
Ident.: DSC-22-FMS-20-20-20-330-00013519.0001001 / 22 APR 14

PERM DATA SETUP LIST

Indicates the optional time data that is displayed on the permanent data.
The flight crew selects the optional time data from the PERM DATA SETUP list.

The PERM DATA SETUP list has the following options:
- FLT TIME: The permanent data displays the flight time, in addition to the UTC time
- BLK TIME: The permanent data displays the block time, in addition to the UTC time
- DATE: The permanent data displays the date, in addition to the UTC time
- UTC ONLY: The permanent data displays the UTC time, and no optional time data.

PERM DATA SETUP List



L2 The option of the PERM DATA SETUP list that is automatically selected by default can be FLT TIME, BLK TIME, or DATE. The Operator uses the AMI file to define the option that is automatically selected by default.
L3 For information about the AMI file, *Refer to DSC-22-FMS-10-20 Airline Modifiable Information (AMI) File*.

Ident.: DSC-22-FMS-20-20-20-330-00013520.0001001 / 14 APR 14

BLOCK TIME

Indicates the block time.
The block time can also be displayed on the permanent data, depending on the option that is selected in the PERM DATA SETUP list (*Refer to PERM DATA SETUP List*).

The FMS computes the block time.
The flight crew can modify the parameters that the FMS uses to compute the block time. In order to modify the parameters, the flight crew clicks on the corresponding MODIFY button (*Refer to MODIFY Button*).

Ident.: DSC-22-FMS-20-20-20-330-00013521.0001001 / 22 APR 14

FLIGHT TIME

Indicates the flight time.
The flight time can also be displayed on the permanent data, depending on the option that is selected in the PERM DATA SETUP list (*Refer to PERM DATA SETUP List*).
The FMS computes the flight time.
The flight crew can modify the parameters that the FMS uses to compute the flight time. In order to modify the parameters, the flight crew clicks on the corresponding MODIFY button (*Refer to MODIFY Button*).

Ident.: DSC-22-FMS-20-20-20-330-00013523.0001001 / 22 APR 14

MODIFY BUTTON

Displays:
- The BLOCK TIME modification window (*Refer to BLOCK TIME Modification Window*), if the flight crew clicks on the MODIFY button that is next to the block time
- The FLIGHT TIME modification window (*Refer to FLIGHT TIME Modification Window*), if the flight crew clicks on the MODIFY button that is next to the flight time.

WSSS	+8 H 00 MN	21:08	04:50

BLOCK TIME Modification Window

BLOCK TIME

Indicates the block time.

The FMS computes the block time as follows:
- If there is a start time in the START TIME entry field, but no stop time in the STOP TIME entry field (i.e. the STOP TIME entry field displays dashes), the block time corresponds to the elapsed time between the start time and the current UTC time
- If there is a start time in the START TIME entry field and a stop time in the STOP TIME entry field, the block time corresponds to the elapsed time between the start time and the stop time.

START TIME ENTRY FIELD

Indicates the start time that the FMS uses to compute the block time.
The start time is the UTC time at which the block time begins.
The FMS automatically defines the start time. The start time that the FMS automatically defines is displayed in small blue font.
The flight crew can overwrite the value that the FMS automatically defines. The value that the flight crew enters is displayed in large blue font.
If the flight crew clears the manually-entered value, the value that the FMS automatically defines reappears.

Entry Format

Refer to DSC-22-FMS-20-80 START TIME.

STOP TIME ENTRY FIELD

Indicates the stop time that the FMS uses to compute the block time.
The stop time is the UTC time at which the block time ends.
The FMS automatically defines the stop time. The stop time that the FMS automatically defines is displayed in small blue font.
The flight crew can overwrite the value that the FMS automatically defines. The value that the flight crew enters is displayed in large blue font.
If the flight crew clears the manually-entered value, the value that the FMS automatically defines reappears.

L2 The STOP TIME entry field is not available, if there is no start time in the START TIME entry field (i.e. if the START TIME entry field displays dashes).

L1 Entry Format

Refer to DSC-22-FMS-20-80 STOP TIME.

CLOSE BUTTON

When clicked, saves the values that are entered in the START TIME and STOP TIME entry fields, and closes the BLOCK TIME modification window.

FLIGHT TIME

Indicates the flight time.

The FMS computes the flight time as follows:
- If there is a start time in the START TIME entry field, but no stop time in the STOP TIME entry field (i.e. the STOP TIME entry field displays dashes), the flight time corresponds to the elapsed time between the start time and the current UTC time
- If there is a start time in the START TIME entry field and a stop time in the STOP TIME entry field, the flight time corresponds to the elapsed time between the start time and the stop time.

START TIME ENTRY FIELD

Indicates the start time that the FMS uses to compute the flight time.
The start time is the UTC time at which the flight time begins.
The FMS automatically defines the start time. The start time that the FMS automatically defines is displayed in small blue font.
The flight crew can overwrite the value that the FMS automatically defines. The value that the flight crew enters is displayed in large blue font.
If the flight crew clears the manually-entered value, the value that the FMS automatically defines reappears.

Entry Format

Refer to DSC-22-FMS-20-80 START TIME.

STOP TIME ENTRY FIELD

Indicates the stop time that the FMS uses to compute the flight time.
The stop time is the UTC time at which the flight time ends.
The FMS automatically defines the stop time. The stop time that the FMS automatically defines is displayed in small blue font.
The flight crew can overwrite the value that the FMS automatically defines. The value that the flight crew enters is displayed in large blue font.
If the flight crew clears the manually-entered value, the value that the FMS automatically defines reappears.

L2 The STOP TIME entry field is not available, if there is no start time in the START TIME entry field (i.e. if the START TIME entry field displays dashes).

L1 Entry Format

Refer to DSC-22-FMS-20-80 STOP TIME.

CLOSE BUTTON

When clicked, saves the values that are entered in the START TIME and STOP TIME entry fields, and closes the FLIGHT TIME modification window.

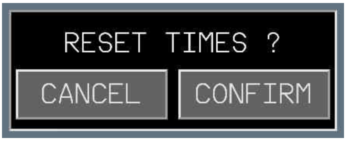
Ident.: DSC-22-FMS-20-20-20-330-00013525.0001001 / 22 APR 14

RESET TO ZERO BUTTON

When clicked:
- Sets the block time to 00:00:00
- Sets the flight time to 00:00:00.

The flight crew must perform a confirmation action.

Confirmation Window



The RESET TO ZERO button is only available during the PREFLIGHT and DONE flight phases.

Ident.: DSC-22-FMS-20-20-20-330-00013526.0001001 / 22 APR 14

TIME MARKER UTC ENTRY FIELD

In the TIME MARKER UTC entry field, the flight crew enters the UTC time that defines the time marker.
The upper part of the ND displays the pseudo waypoint that corresponds to the time marker.
If the flight crew defines the time marker with the REMAINING TIME entry field (*Refer to REMAINING TIME Entry Field*), the UTC time that defines the time marker is automatically entered.
The manually-entered value is displayed in large blue font, and the automatically-entered value is displayed in small blue font.

ENTRY FIELD

Refer to DSC-22-FMS-20-80 TIME MARKER UTC.

Ident.: DSC-22-FMS-20-20-20-330-00013528.0001001 / 22 APR 14

REMAINING TIME ENTRY FIELD

The flight crew enters the remaining time in the REMAINING TIME entry field.
The remaining time corresponds to the remaining time between the current UTC time and the UTC time that defines the time marker.
The upper part of the ND displays the pseudo waypoint that corresponds to the time marker.
If the flight crew defines the time marker with the TIME MARKER UTC entry field (*Refer to TIME MARKER UTC Entry Field*), the remaining time is automatically entered.
The manually-entered value is displayed in large blue font, and the automatically-entered value is displayed in small blue font.

ENTRY FIELD

Refer to DSC-22-FMS-20-80 REMAINING TIME.

Ident.: DSC-22-FMS-20-20-20-330-00013529.0001001 / 22 APR 14

TEXT ENTRY FIELD

The flight crew can enter text in order to identify the time marker.
This text is not mandatory for definition of the time marker, and is displayed only on the POSITION/TIME page.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 TEXT.

Ident.: DSC-22-FMS-20-20-20-330-00013530.0001001 / 14 APR 14

AURAL ALERT OPTION

The flight crew selects the AURAL ALERT option, if they want the "Time Marker" audio indicator to sound.
The "Time Marker" audio indicator sounds, when the remaining time between the current UTC time and the UTC time that defines the time marker is equal to 30 s.

Time Marker (Sound and Synthetic Voice)

Ident.: DSC-22-FMS-20-20-20-330-00013531.0001001 / 14 APR 14

ARPT ENTRY FIELD

The flight crew enters the ident of the airport for which they want to display the local time.
By default, the ARPT entry field displays the ident of the departure airport of the active flight plan.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 AIRPORT (ARPT).

Ident.: DSC-22-FMS-20-20-20-330-00013532.0001001 / 22 APR 14

DESTINATION AIRPORT

Indicates the destination airport of the active flight plan.

Ident.: DSC-22-FMS-20-20-20-330-00013533.0001001 / 22 APR 14

UTC DIFF ENTRY FIELDS

In the UTC DIFF H and UTC DIFF MN entry fields, the flight crew enters the time difference between the UTC time and the airport local time.
The FMS uses this time difference to compute the airport local time.

When the flight crew enters a value in the UTC DIFF H entry field, the UTC DIFF MN entry field is automatically set to 00. The flight crew can modify this automatic entry in the UTC DIFF MN entry field.
When the flight crew enters a value in the UTC DIFF MN entry field and the UTC DIFF H entry field displays dashes, the UTC DIFF H is automatically set to 00. The flight crew can modify this automatic entry in the UTC DIFF HH entry field.

L2 If the value entered in the UTC DIFF H entry field is different from 00, the flight crew cannot enter a negative value in the UTC DIFF MN entry field.
If the flight crew enters a valid negative value in the UTC DIFF MN entry field, the minus sign automatically applies to the UTC DIFF HH entry field (e.g. if the flight crew enters -30 in the UTC DIFF MN entry field, the UTC DIFF HH entry field displays -00 and the UTC DIFF MN displays 30).

L1 ENTRY FORMAT

For the entry format of:
- Hours, *Refer to DSC-22-FMS-20-80 UTC DIFF (HOURS)*
- Minutes, *Refer to DSC-22-FMS-20-80 UTC DIFF (MINUTES)*.

Ident.: DSC-22-FMS-20-20-20-330-00013534.0001001 / 22 APR 14

LOCAL TIME

Indicates the local time at the corresponding airport.

The FMS computes the local time, based on:
- The UTC time
- The values that are entered in the UTC DIFF entry fields.

LOCAL TIME = UTC + UTC DIFF

Ident.: DSC-22-FMS-20-20-20-330-00013535.0001001 / 22 APR 14

LOCAL ETA AT DEST

Indicates the Estimated Time of Arrival (ETA), in local time, at the destination airport.

The FMS computes the ETA in local time, based on:
- The ETA that is defined in UTC time
- The values that are entered in the UTC DIFF entry fields.

LOCAL ETA AT DEST = UTC ETA + UTC DIFF
The FMS cannot compute the local time for the ETA, if the flight crew does not enter the time difference in the UTC DIFF entry fields. In this case, dashes appear instead of the local time.

Ident.: DSC-22-FMS-20-20-20-330-00013536.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the ACTIVE/F-PLN page (*Refer to page*).

L2 The RETURN button appears, only if the flight crew accesses the POSITION/TIME page via the ACTIVE/F-PLN page.

PURPOSE

On the RECEIVED COMPANY T.O DATA page, the flight crew can:
- Check the received company takeoff data
- Insert the received takeoff data in the flight plan.

The flight crew can display takeoff data for up to four runways, and for two different takeoff thrust settings per runway.
The RECEIVED COMPANY T.O DATA page is available for the active flight plan only.

ACCESS

The flight crew can access the RECEIVED COMPANY T.O DATA page via:

- The ACTIVE/INIT page, by clicking on the RECEIVED CPNY T.O button

T.O DATA REQUEST

Ident.: DSC-22-FMS-20-20-20-340-00004258.0001001 / 14 APR 14

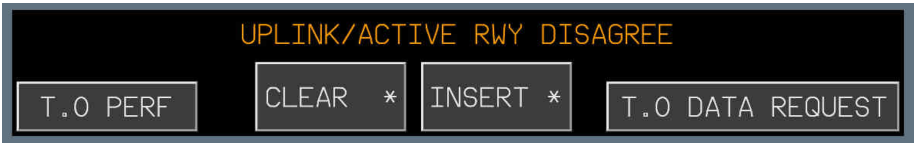
DATA FOR RWY

Indicates the runway that is associated with the displayed takeoff data.

Note: *If the received runway is different from the runway that is selected in the active flight plan:*
- *The runway ident appears in amber*

- *The UPLINK/ACTIVE RWY DISAGREE label appears at the bottom of the RECEIVED COMPANY T.O DATA page.*

UPLINK/ACTIVE RWY DISAGREE Label

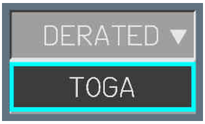


Ident.: DSC-22-FMS-20-20-20-340-00004259.0001001 / 22 APR 14

T.O THRUST BUTTON

The label of the T.O thrust button indicates the thrust setting that is associated with the displayed takeoff data.
When the flight crew clicks on the T.O thrust button, the T.O thrust menu appears.

T.O Thrust Menu



The T.O thrust menu has the following options:
- TOGA: Displays the takeoff data that corresponds to the TOGA thrust
- DERATED(FLEX): Displays the takeoff data that corresponds to the DTO(FLX) thrust.

Ident.: DSC-22-FMS-20-20-20-340-00004260.0001001 / 22 APR 14

RWY SCROLL BUTTONS

The flight crew uses the RWY scroll buttons to scroll, one by one, through the four runway pages.

Ident.: DSC-22-FMS-20-20-20-340-00004261.0001001 / 22 APR 14

RWY PAGE NUMBER

Indicates the rank of the displayed runway page, and the total number of runway pages.

Ident.: DSC-22-FMS-20-20-20-340-00004269.0001001 / 22 APR 14

T.O SHIFT

Indicates the runway takeoff shift.
The runway takeoff shift is the distance between the runway threshold, and the position at which the flight crew releases the aircraft brakes in order to take off.

Ident.: DSC-22-FMS-20-20-20-340-00004262.0001001 / 09 MAR 16

TOW, T.O CG, AND TEMP

Indicate:

- The aircraft weight and CG that are associated with the takeoff data
- The outside temperature that is associated with the takeoff runway, when the TOGA thrust setting is selected.
  When the flight crew selects a FLX or a DTO thrust, green dashes are displayed instead of the temperature value.

L12

Note: *The FMS crosschecks the received takeoff weight with the FMS takeoff weight.*

If the received takeoff weight is outside an acceptable margin:

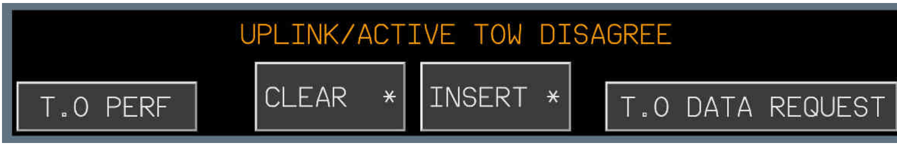
- *The takeoff weight value appears in amber*

Amber TOW

TOW 250.5 T

- *If the received runway is the same as the runway that is selected in the active flight plan, the UPLINK/ACTIVE TOW DISAGREE label appears at the bottom of the RECEIVED COMPANY T.O DATA page.*

UPLINK/ACTIVE TOW DISAGREE Label



UPLINK/ACTIVE TOW DISAGREE

The received takeoff weight is within an acceptable margin, if the received takeoff weight is not more than 1 t (2.2 klb) below or 3 t (6.6 klb) above the FMS takeoff weight.

Ident.: DSC-22-FMS-20-20-20-340-00004270.0001001 / 22 APR 14

T.O LIMIT

Indicates the limited runway length for takeoff (i.e. the runway length that is really available for takeoff).

Ident.: DSC-22-FMS-20-20-20-340-00004263.0001001 / 22 APR 14

MAG WIND

Indicates the wind direction and wind speed that are associated with the takeoff runway.
L2 If the airport reference is true north, the wind is the true wind. The label is TRUE WIND instead of MAG WIND.

Ident.: DSC-22-FMS-20-20-20-340-00004264.0001001 / 22 APR 14

RWY COND

Indicates the takeoff runway condition.

Ident.: DSC-22-FMS-20-20-20-340-00004265.0001001 / 22 APR 14

QNH

Indicates the QNH that is associated with the takeoff runway.

Ident.: DSC-22-FMS-20-20-20-340-00004267.0001001 / 22 APR 14

V1, VR, AND V2

Indicates the takeoff speeds (V1, VR, and V2) that are associated with the takeoff runway.

Ident.: DSC-22-FMS-20-20-20-340-00004268.0001001 / 22 APR 14

FLAPS

Indicates the flaps setting that is associated with the takeoff runway.

Ident.: DSC-22-FMS-20-20-20-340-00004266.0001001 / 02 OCT 14

T.O THRUST OPTION LIST

Indicates the takeoff thrust setting that is associated with the displayed takeoff data.
The flight crew can display the takeoff data for two different takeoff thrust settings per runway.

To select the takeoff thrust setting, the flight crew selects one of the following options:
- TOGA, for TOGA thrust
- FLEX, for FLX thrust
- DERATED, for DTO thrust.

Ident.: DSC-22-FMS-20-20-20-340-00004271.0001001 / 22 APR 14

THR RED, ACCEL, AND EO ACCEL

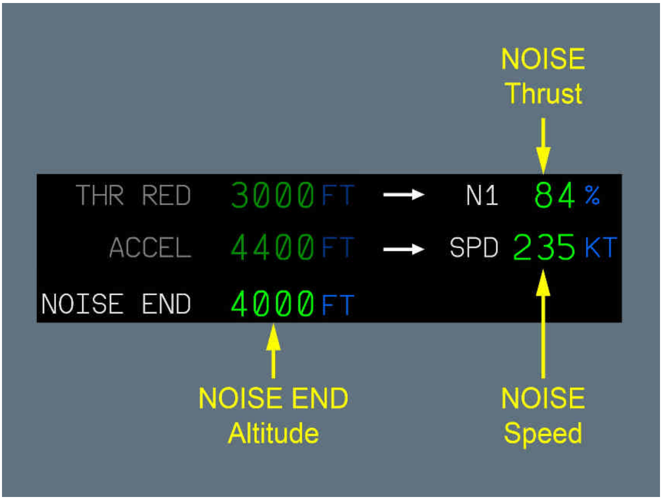
Indicate for the takeoff runway:
- The thrust reduction altitude
- The acceleration altitude with all operative engines
- The acceleration altitude in engine-out situation.

Ident.: DSC-22-FMS-20-20-20-340-00004272.0001001 / 22 APR 14

N1, SPD, AND NOISE END

Indicate the parameters for the NOISE procedure that is associated with the takeoff runway:
- The NOISE thrust
- The NOISE speed
- The NOISE END altitude.

N1, SPD, and NOISE END



When the flight crew inserts the received takeoff data in the flight plan, these parameters are used to automatically enter the NOISE parameters in the NOISE parameters entry fields (i.e. N1, SPD, and NOISE END entry fields) on the T.O and CLB panels of the PERF page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-340-00004274.0001001 / 22 APR 14

T.O PERF BUTTON

When clicked, displays the T.O panel of the ACTIVE/PERF page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-340-00004276.0001001 / 14 APR 14

CLEAR BUTTON

When clicked, deletes the received takeoff data that is associated with all takeoff runways.

Ident.: DSC-22-FMS-20-20-20-340-00004275.0001001 / 22 APR 14

INSERT BUTTON

When clicked:

- Inserts the following takeoff data in the active flight plan:
  - Takeoff speeds (V1, VR, V2)
  - Flaps setting
  - Takeoff thrust setting
  - Takeoff runway shift
  - Thrust reduction altitude, acceleration altitude with all operative engines, and acceleration altitude in engine-out situation
  - NOISE parameters.
- Displays the T.O panel of the ACTIVE/PERF page.
  The T.O panel now displays the inserted takeoff data.

L2 The takeoff data cannot be inserted, when:

- The received runway is different from the active runway, or
- The received takeoff weight differs from the takeoff weight on the FUEL&LOAD page (*Refer to TOW, T.O CG, and TEMP*), or
- One of the following received takeoff data is not defined:
  - Takeoff speeds (V1, VR, V2)
  - Takeoff runway
  - TOW
  - T.O CG
  - Takeoff wind
  - Runway condition
  - QNH
  - Temperature.

Ident.: DSC-22-FMS-20-20-20-340-00004273.0001001 / 22 APR 14

T.O DATA REQUEST BUTTON

When clicked, displays the COMPANY T.O DATA REQUEST page (*Refer to page*).

Ident.: DSC-22-FMS-20-20-20-360-00004288.0001001 / 14 APR 14

CITY-PAIR

Indicates the ICAO idents of:
- The FROM/TO city-pair (i.e. departure airport and destination airport), or
- The TO/ALTN city-pair (i.e. destination airport and alternate airport).

Ident.: DSC-22-FMS-20-20-20-360-00004290.0001001 / 22 APR 14

RTE LIST

Indicates the ident of the displayed company route(company alternate route).

The flight crew selects the company route(company alternate route) to be displayed, by:
- Selecting the ident of the company route(company alternate route) from the RTE list, or
- Using the company route scroll buttons.

The RTE list displays all of the company routes(company alternate routes) that are in the navigation and pilot-stored elements databases, and that are associated with the defined FROM/TO(TO/ALTN) city-pair.

Ident.: DSC-22-FMS-20-20-20-360-00004289.0001001 / 14 APR 14

COMPANY ROUTE NUMBER

Indicates the rank of the displayed company route(company alternate route), and the total number of company routes(company alternate routes) that are associated with the FROM/TO(TO/ALTN) city-pair.

Ident.: DSC-22-FMS-20-20-20-360-00004291.0001001 / 14 APR 14

COMPANY ROUTE SCROLL BUTTONS

The flight crew uses the company route scroll buttons to scroll, one by one, through the company routes(company alternate routes) that are associated with the FROM/TO(TO/ALTN) city-pair.
The flight crew can also scroll through the company routes(company alternate routes) with the wheel of the KCCU.

Ident.: DSC-22-FMS-20-20-20-360-00004292.0001001 / 22 APR 14

ROUTE SUMMARY

Indicates the route summary of the selected company route(company alternate route).
The flight crew must read the summary from left to right, and from top to bottom.
Company route waypoints are displayed in large green font. Airways and procedures are displayed in small white font.

Note: *1. A VIA or a direct flight leg is indicated by DIR.*
2. A runway is indicated by RWY.
3. When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.

Ident.: DSC-22-FMS-20-20-20-360-00004293.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the page that was displayed before the ROUTE SELECTION page.

Ident.: DSC-22-FMS-20-20-20-360-00004295.0001001 / 22 APR 14

ROUTE SUMMARY SCROLL BUTTONS

The flight crew uses the route summary scroll down(up) button to move, page by page, downward(upward) through the route summary.

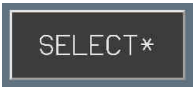
Ident.: DSC-22-FMS-20-20-20-360-00004294.0001001 / 22 APR 14

INSERT BUTTON

When clicked:
- Inserts the selected company route(company alternate route)
- Displays the INIT page (*Refer to page*).

L2 If the flight crew accesses the ROUTE SELECTION page via the ALTERNATE page, the button label is SELECT.

SELECT button



When clicked:
- Selects the company route(company alternate route)
- Displays the ALTERNATE page (*Refer to page*).

PURPOSE

On the SEC INDEX page, the flight crew can manage the three secondary flight plans on three identical panels: SEC 1, SEC 2, and SEC 3 panels.

On each panel, the flight crew can:
- Check the source and route summary of the secondary flight plan
- Import the active flight plan, or any other secondary flight plan, as a new secondary flight plan
- Request a secondary flight plan to the ground station, and insert this secondary flight plan when received
- Perform an exchange between the secondary flight plan and the active flight plan
- Transfer the secondary flight plan to the ATC mailbox
- Print reports for the secondary flight plan
- Access the following SEC pages: SEC/F-PLN, SEC/PERF, SEC/WIND, SEC/FUEL&LOAD, SEC/INIT, and SEC/WHAT IF.

LINKS

For information about:
- The secondary flight plans, *Refer to DSC-22-FMS-10-40-60 Active and Secondary Flight Plans*
- The print function, *Refer to DSC-22-FMS-10-90 Print Function*.

Ident.: DSC-22-FMS-20-20-20-370-00004297.0001001 / 14 APR 14

ACCESS

The flight crew can access the SEC INDEX page ia:

- The KCCU, by pressing the SEC INDEX key

CITY-PAIR

Indicates the ICAO idents of the FROM/TO city-pair (i.e. departure airport and destination airport).

Ident.: DSC-22-FMS-20-20-20-370-00004055.0001001 / 22 APR 14

WHAT IF LABEL

Indicates that the secondary flight plan contains a WHAT IF scenario.

 WHAT IF - DEPRESS	The WHAT IF scenario is simulated depressurization.
 WHAT IF- EO	The WHAT IF scenario is a simulated engine-out.

For more information about the WHAT IF function, *Refer to DSC-22-FMS-10-40-40 WHAT IF Function*.

Ident.: DSC-22-FMS-20-20-20-370-00004299.0001001 / 22 APR 14

FLIGHT PLAN CREATION SOURCE

Indicates:

- The UTC time at which the secondary flight plan was created
- The source of creation of the secondary flight plan:
  - (IMPORT ACTIVE)
    The flight crew created the secondary flight plan by importing the active flight plan.
  - (IMPORT ACTIVE-MODIFIED)
    The flight crew created the secondary flight plan by importing the active flight plan, and changed it via flight plan revisions.
  - (SWAP ACTIVE)
    The flight crew created the secondary flight plan by performing an exchange between the active flight plan and the secondary flight plan.
  - (SWAP ACTIVE-MODIFIED)
    The flight crew created the secondary flight plan by performing an exchange between the active flight plan and the secondary flight plan, and changed it via a flight plan revisions.
  - (MANUAL)

    The flight crew manually created the secondary flight plan via:
    - ■ The SEC/INIT page, or
    - ■ The SEC/F-PLN page, or
    - ■ The SEC/INIT and the SEC/F-PLN pages.
  - (CPNY F-PLN)
    The flight crew created the secondary flight plan by inserting a received company flight plan.
  - (CPNY F-PLN-MODIFIED)
    The flight crew created the secondary flight plan by inserting a received company flight plan, and changed it via flight plan revisions.
  - (ATC F-PLN)
    The flight crew created the secondary flight plan by uploading a received ATC flight plan.

    Note: *An ATC flight plan can be uploaded only in the third secondary flight plan (SEC 3).*
  - (ATC F-PLN-MODIFIED)
    The flight crew created the secondary flight plan by uploading a received ATC flight plan, and changed it flight plan revisions.

    Note: *An ATC flight plan can be uploaded only in the third secondary flight plan (SEC 3).*

When the flight crew imports a secondary flight plan in another secondary flight plan, the source of creation of the new secondary flight plan is the source of the flight plan that was imported.

Ident.: DSC-22-FMS-20-20-20-370-00004300.0001001 / 22 APR 14

ROUTE SUMMARY

Indicates the route summary of the secondary flight plan.
The flight crew must read the summary from left to right, and from top to bottom.
Waypoints are displayed in large font. Airways and procedures are displayed in small font.

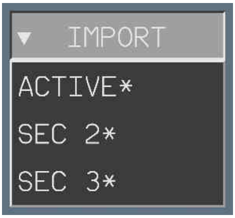
Note: *1. A VIA or a direct flight leg is indicated by DIR.*
2. A runway is indicated by RWY.
3. When the route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.

Ident.: DSC-22-FMS-20-20-20-370-00004302.0001001 / 22 APR 14

IMPORT BUTTON

When clicked, opens the IMPORT menu.

IMPORT Menu



The flight crew selects one of the option of the IMPORT MENU in order to create the secondary flight plan by importing (i.e. making a copy of):
- The active flight plan, or
- One of the two other secondary flight plans.

For more information, *Refer to DSC-22-FMS-10-40-60 Secondary Flight Plan Initialization*.

Ident.: DSC-22-FMS-20-20-20-370-00004303.0001001 / 14 APR 14

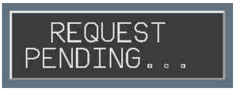
CPNY F-PLN REQUEST BUTTON

When clicked, displays the COMPANY F-PLN REQUEST page (*Refer to page*).

L2 The CPNY F-PLN REQUEST button is available, only when no other flight plan request is in progress.

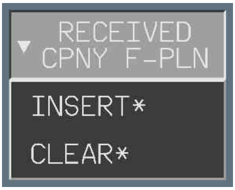
L1 When a request for a secondary flight plan is in progress, the button label is REQUEST PENDING... . When clicked, still displays the COMPANY F-PLN REQUEST page.

REQUEST PENDING...



When a secondary company flight plan is received, the button label is RECEIVED CPNY F-PLN. When clicked, opens a menu that enables the flight crew to insert or clear the received company flight plan.

RECEIVED CPNY F-PLN Menu



Ident.: DSC-22-FMS-20-20-20-370-00004304.0001001 / 22 APR 14

SEC PAGE BUTTONS

The SEC page buttons are not available, when the secondary flight plan is empty.

F-PLN BUTTON

When clicked, displays the SEC/F-PLN page (*Refer to page*).

PERF BUTTON

When clicked, displays the SEC/PERF page (*Refer to page*).

WIND BUTTON

When clicked, displays the SEC/WIND page (*Refer to page*).

FUEL&LOAD BUTTON

When clicked, displays the SEC/FUEL&LOAD page (*Refer to page*).

INIT BUTTON

When clicked, displays the SEC/INIT page (*Refer to page*).

WHAT IF BUTTON

When clicked, displays the SEC/WHAT IF page (*Refer to page*).
The WHAT IF button is not available, if the FMS Engine-Out (EO) mode is active.

Ident.: DSC-22-FMS-20-20-20-370-00004306.0001001 / 22 APR 14

DELETE BUTTON

When clicked, deletes the secondary flight plan and its associated data.

Ident.: DSC-22-FMS-20-20-20-370-00004301.0001001 / 22 APR 14

ROUTE SUMMARY SCROLL BUTTONS

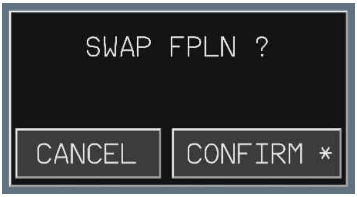
The flight crew uses the route summary scroll down(up) button to move, page by page, downward(upward) through the route summary.

Ident.: DSC-22-FMS-20-20-20-370-00004305.0001001 / 22 APR 14

SWAP ACTIVE BUTTON

When clicked, the secondary flight plan becomes the active flight plan, and vice versa.
The flight crew must perform a confirmation action.

CONFIRM/CANCEL Window



The SWAP ACTIVE button is not available, when the SWAP function is not available.
For more information about the SWAP function, *Refer to DSC-22-FMS-10-40-60 Secondary and Active Flight Plan Exchange*.

Ident.: DSC-22-FMS-20-20-20-370-00004309.0001001 / 22 APR 14

REJECTED ATC INFO BUTTON

When clicked, displays the REJECTED ATC INFO page (*Refer to page*).

The REJECTED ATC INFO button is displayed only on the SEC 3 panel, and when all of the following occur:
- An ATC flight plan is loaded
- The FMS rejected some elements of the ATC flight plan.
  The flight crew can check the rejected elements on the REJECTED ATC INFO page.

Note: *The flight crew can load an ATC flight plan only in the third secondary flight plan (SEC 3).*

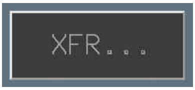
Ident.: DSC-22-FMS-20-20-20-370-00004307.0001001 / 22 APR 14

XFR TO MAILBOX BUTTON

When clicked:

- If the free text AMI option is not activated, sends the flight plan to the ATC mailbox
L2 During the transmission of the flight plan to the ATC mailbox, the button label is XFR..., and the button is not available.

XFR...



L1
- If the free text AMI option is activated, displays the TRANSFER TO MAILBOX page (*Refer to page*).
On the TRANSFER TO MAILBOX page, the flight crew can enter any free text that will be sent with the flight plan.

Ident.: DSC-22-FMS-20-20-20-370-00004308.0001001 / 22 APR 14

PRINT BUTTON

When clicked, prints the secondary flight plan.

ETA 08:46:23

Ident.: DSC-22-FMS-20-20-20-390-00004315.0001001 / 22 APR 14

PURPOSE

The VERT REV page has 5 panels: RTA, SPD, CMS, ALT, and STEP ALTs.

On the RTA panel of the VERT REV page, the flight crew can:
- Insert, modify, or delete a time constraint (RTA) at a waypoint
- Insert, modify, or delete the Estimated Takeoff Time (ETT).

On the SPD panel of the VERT REV page, the flight crew can:
- Insert, modify, or delete a speed constraint at a waypoint
- Insert, modify, or delete the climb and descent speed limit.

On the CMS panel of the VERT REV page, the flight crew can insert, modify, or delete a Constant Mach Segment (CMS).
On the ALT panel of the VERT REV page, the flight crew can insert, modify, or delete a climb or descent altitude constraint at a waypoint.

On the STEP ALTs panel of the VERT REV page, the flight crew can:
- Insert, modify, or delete a step climb or step descent at a waypoint
- Insert a step climb with optimum step start point.

The VERT REV page is available for the active and secondary flight plans.

STEP ALTs NOT ALLOWED IN EO

Ident.: DSC-22-FMS-20-20-20-390-00004322.0001001 / 22 APR 14

RETURN BUTTON

When clicked, displays the page that was displayed before the VERT REV page.

Ident.: DSC-22-FMS-20-20-20-390-00004323.0001001 / 22 APR 14

TMPY F-PLN BUTTON

When clicked, displays the F-PLN page.

The TMPY F-PLN button is displayed, only if a temporary flight plan is on standby.

Ident.: DSC-22-FMS-20-20-20-390-00004325.0001001 / 22 APR 14

RTA MESSAGE AREA

The RTA message area displays the following messages (only one message appears at a time):

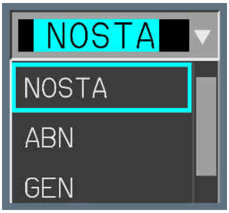
EXISTING RTA AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of a waypoint.) Indicates that: - The flight plan has already an RTA at the XXXXXXX waypoint - The XXXXXXX waypoint is different from the revised waypoint that the flight crew selected to insert an RTA. The flight plan can have only one RTA. Therefore, if the flight crew inserts a new RTA at a waypoint that is not the XXXXXXX waypoint, the FMS deletes the RTA at the XXXXXXX waypoint.
EXISTING RTA AT XXXXXXX DELETED IN TMPY	(The "XXXXXXX" corresponds to the ident of a waypoint.) Indicates that the FMS deleted the RTA at the XXXXXXX waypoint.
RTA NOT ALLOWED AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of the revised waypoint.) Indicates that the flight crew cannot insert an RTA at the XXXXXXX waypoint.

Ident.: DSC-22-FMS-20-20-20-390-00004326.0001001 / 22 APR 14

RTA AT LIST

Indicates the revised waypoint.
The revised waypoint is the waypoint at which the RTA will be inserted.
The flight crew enters the ident of the revised waypoint via the keyboard, or by selecting the ident from the RTA AT list.
The RTA AT list displays all of the possible waypoints at which an RTA can be inserted.

RTA AT List



By default, the selected revised waypoint is the waypoint of the F-PLN page from which the flight crew accessed the RTA panel.

L3 The RTA message area of the RTA panel displays the EXISTING RTA AT XXXXXXX message (the "XXXXXXX" corresponds to a waypoint ident), if all of the following occur:
- There is already an RTA in the flight plan at the XXXXXXX waypoint
- The flight crew selects a waypoint, from the RTA AT list, that is not the XXXXXXX waypoint.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 WAYPOINT.

Ident.: DSC-22-FMS-20-20-20-390-00004327.0001001 / 22 APR 14

DIST

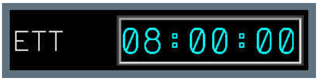
Indicates the distance, along the flight plan, between the aircraft present position and the revised waypoint.

Ident.: DSC-22-FMS-20-20-20-390-00004328.0001001 / 22 APR 14

UTC

Indicates the UTC time.
In the PREFLIGHT flight phase, the ETT entry field appears instead of the UTC time.

ETT Entry Field



ETT 08:00:00

L2 The entered ETT will be the aircraft time reference for the flight-plan time predictions.
For information about the ETT, *Refer to DSC-22-FMS-10-40-30 Purpose*.

L1 **ENTRY FORMAT**

Refer to DSC-22-FMS-20-80 ETT.

Ident.: DSC-22-FMS-20-20-20-390-00004329.0001001 / 22 APR 14

ETA

Indicates the Estimated Time of Arrival (ETA) at the revised waypoint.

Ident.: DSC-22-FMS-20-20-20-390-00004330.0001001 / 22 APR 14

RTA OPTION LIST

The flight crew selects the category of RTA, by selecting one of the following options:
- AT
- AT OR BEFORE
- AT OR AFTER.

When one of the three options is selected, the associated RTA entry field is displayed (*Refer to RTA Entry Field*).

Ident.: DSC-22-FMS-20-20-20-390-00004331.0001001 / 22 APR 14

RTA ENTRY FIELD

The flight crew enters the Required Time of Arrival (RTA) in the entry field.
The default value for the RTA is the ETA at the revised waypoint.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 RTA.

Ident.: DSC-22-FMS-20-20-20-390-00004335.0001001 / 22 APR 14

DELETE RTA BUTTON

When clicked, deletes the RTA, and creates(updates) the temporary flight plan.

L3 When clicked, displays the F-PLN page, if all of the following apply:
- The flight phase is DES or APPR
- The aircraft current altitude is below:
  - FL 100, or
  - The descent speed limit altitude, if the descent speed limit altitude is above FL 100.

Ident.: DSC-22-FMS-20-20-20-390-00004332.0001001 / 22 APR 14

RTA SPD

Indicates the Mach number and the CAS of the RTA speed.
The RTA speed is the managed speed/Mach target for the FG, if the flight crew engages the managed speed/Mach control.

L2 When an RTA is defined, but not yet inserted in the active flight plan (i.e. the temporary flight plan is on standby), the displayed RTA speed becomes the managed speed/Mach target, only after the flight crew inserts the temporary flight plan.

Ident.: DSC-22-FMS-20-20-20-390-00004334.0001001 / 22 APR 14

TIME ERROR

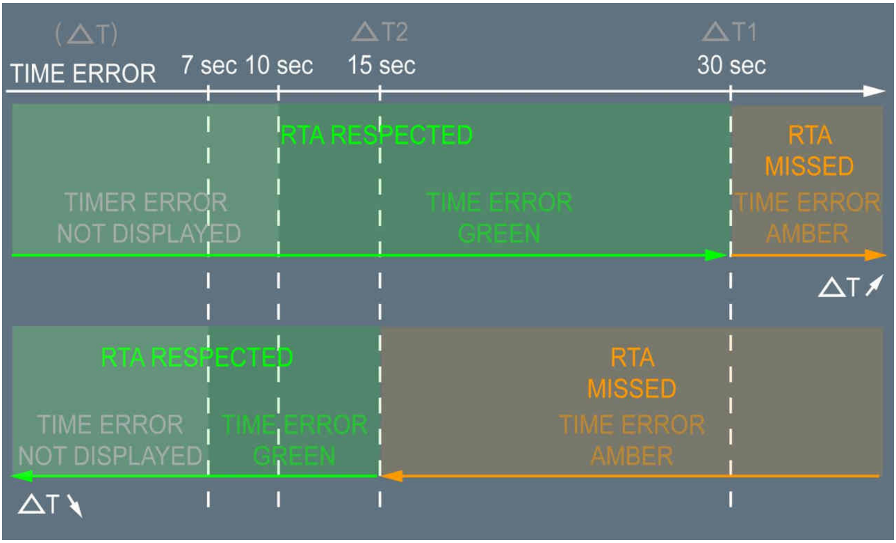
If applicable, indicates the time error and the type of time error.

Time error = ETA - RTA.

The type of time error can be one of the following:
- LATE: Indicates that the aircraft will arrive at the revised waypoint later than the requested AT or AT OR BEFORE constraint
- EARLY: Indicates the aircraft will arrive at the revised waypoint earlier than the requested AT or AT OR AFTER constraint.

L2 The following illustration explains the logic for the display of the time error.

Time Error Display



(ΔT)
TIME ERROR
7 sec
10 sec
ΔT2
15 sec
ΔT1
30 sec
RTA RESPECTED
TIMER ERROR NOT DISPLAYED
TIME ERROR GREEN
RTA MISSED
TIME ERROR AMBER
ΔT
RTA RESPECTED
TIME ERROR NOT DISPLAYED
TIME ERROR GREEN
RTA MISSED
TIME ERROR AMBER
ΔT

L3 *Note:* *ΔT1 and ΔT2 are respectively 30 s and 15 s, if the distance between the aircraft and the revised waypoint is less than 2 000 NM.*
If the distance is more than 2 000 NM, ΔT1 and ΔT2 linearly increase at a rate of 60 s per 1 000 NM.

Ident.: DSC-22-FMS-20-20-20-390-00004337.0001001 / 22 APR 14

SPD CSTR MESSAGE AREA

The SPD CSTR message area displays the following messages (only one message appears at a time):

SPD CSTR NOT ALLOWED AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of the revised waypoint.) Indicates that the flight crew cannot insert a speed constraint at the XXXXXXX waypoint.
TOO STEEP PATH AHEAD	Indicates that the revised waypoint is on a too-steep-path segment.

Ident.: DSC-22-FMS-20-20-20-390-00004339.0001001 / 22 APR 14

SPD CSTR TYPE

Indicates the type of speed constraint.

The type of speed constraint can be one of the following:
- CLB: The speed constraint is a climb speed constraint
- DES: The speed constraint is a descent speed constraint.

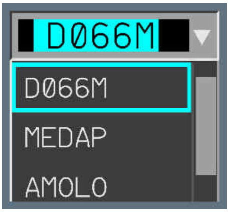
If the FMS cannot determine the type of speed constraint, the SPD CSTR type option list appears next to the SPD CSTR entry field. The SPD CSTR type option list enables the flight crew to select the desired type of speed constraint (*Refer to SPD CSTR Type Option List*).

Ident.: DSC-22-FMS-20-20-20-390-00004338.0001001 / 22 APR 14

SPD CSTR AT LIST

Indicates the revised waypoint.
The revised waypoint is the waypoint at which the speed constraint will be inserted.
The flight crew enters the ident of the revised waypoint via the keyboard, or by selecting the ident from the SPD CSTR AT list.
The SPD CSTR AT list displays all of the possible waypoints at which a speed constraint can be inserted.

SPD CSTR AT List



By default, the selected revised waypoint is the waypoint of the F-PLN page from which the flight crew accessed the SPD panel.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

Ident.: DSC-22-FMS-20-20-20-390-00004340.0001001 / 22 APR 14

SPD CSTR ENTRY FIELD

The flight crew enters the speed constraint in the entry field.
There may be a default speed constraint that is associated with the revised waypoint, and that is stored in the navigation database. The flight crew can always overwrite the default value.

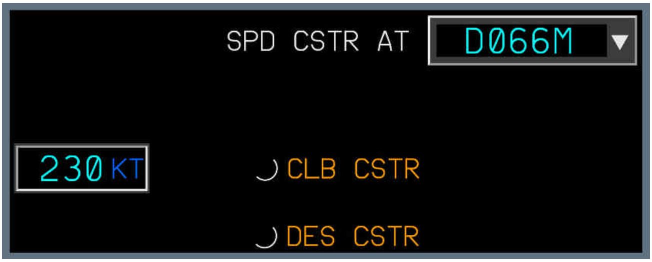
ENTRY FORMAT

Refer to DSC-22-FMS-20-80 SPD.

Ident.: DSC-22-FMS-20-20-20-390-00004341.0001001 / 22 APR 14

SPD CSTR TYPE OPTION LIST

SPD CSTR Type Option List



The flight crew selects the applicable type of speed constraint, by selecting one of the following options:
- CLB CSTR: The speed constraint is a climb speed constraint
- DES CSTR: The speed constraint is a descent speed constraint.

The SPD CSTR option list is displayed, only if the FMS cannot automatically determine the type of speed constraint.

Ident.: DSC-22-FMS-20-20-20-390-00004342.0001001 / 22 APR 14

DELETE SPD CSTR BUTTON

When clicked, deletes the speed constraint, and creates(updates) the temporary flight plan.

Ident.: DSC-22-FMS-20-20-20-390-00004343.0001001 / 22 APR 14

SPD LIMIT TYPE

Indicates the type of speed limit.

The type of speed limit can be one of the following:
- CLB SPD LIMIT: The speed limit is a climb speed limit
- DES SPD LIMIT: The speed limit is a descent speed limit.

Ident.: DSC-22-FMS-20-20-20-390-00004344.0001001 / 22 APR 14

SPD LIMIT ENTRY FIELDS

The flight crew enters the speed and altitude values of the speed limit in the entry fields.

The default speed limit is one of the following (the first-listed has the highest priority):
- The navigation database values, if any
  There may be default speed and altitude values that are associated with the departure airport and the destination airport, and that are stored in the navigation database.
- The FMS default values: 250 kt/10 000 ft.

The flight crew can always overwrite the default values.

ENTRY FORMAT

For the entry format of:
- Speed, *Refer to DSC-22-FMS-20-80 SPD*
- Altitude, *Refer to DSC-22-FMS-20-80 ALT*.

Ident.: DSC-22-FMS-20-20-20-390-00004345.0001001 / 22 APR 14

DELETE SPD LIMIT BUTTON

When clicked, deletes the speed limit, and creates(updates) the temporary flight plan.

Ident.: DSC-22-FMS-20-20-20-390-00004347.0001001 / 14 APR 14

CMS MESSAGE AREA

The CMS message area displays the following message:

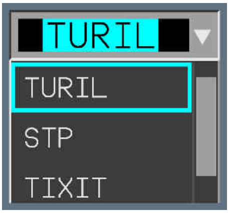
CMS CSTR NOT ALLOWED AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of the revised waypoint.) Indicates that the flight crew cannot insert a CMS at the XXXXXXX waypoint.

Ident.: DSC-22-FMS-20-20-20-390-00004348.0001001 / 22 APR 14

START WPT LIST

Indicates the start waypoint.
The flight crew enters the ident of the start waypoint via the keyboard, or by selecting the ident from the START WPT list.
The START WPT list displays the flight-plan cruise waypoints that are after the aircraft present position.

START WPT List



ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

Ident.: DSC-22-FMS-20-20-20-390-00004349.0001001 / 22 APR 14

MACH ENTRY FIELD

The flight crew enters the Mach value in the entry field.

ENTRY FORMAT

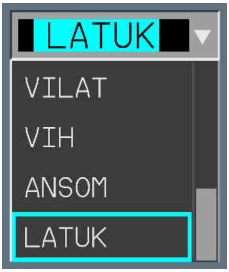
Refer to DSC-22-FMS-20-80 MACH.

Ident.: DSC-22-FMS-20-20-20-390-00004350.0001001 / 22 APR 14

END WPT LIST

Indicates the end waypoint.
The flight crew enters the ident of the end waypoint via the keyboard, or by selecting the ident from the END WPT list.
The END WPT list displays the flight-plan cruise waypoints that are after the selected start waypoint.

End Waypoint List



ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

Ident.: DSC-22-FMS-20-20-20-390-00004351.0001001 / 22 APR 14

DELETE CMS BUTTON

When clicked, deletes the CMS, and creates(updates) the temporary flight plan.

Ident.: DSC-22-FMS-20-20-20-390-00004353.0001001 / 14 APR 14

ALT CSTR MESSAGE AREA

The ALT CSTR message area displays the following messages (only one message appears at a time):

ALT CSTR NOT ALLOWED AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of the revised waypoint.) Indicates that the flight crew cannot insert an altitude constraint at the XXXXXXX waypoint.
TOO STEEP PATH AHEAD	Indicates that the revised waypoint is on a too-steep-path segment.

Ident.: DSC-22-FMS-20-20-20-390-00004354.0001001 / 14 APR 14

ALT CSTR TYPE

Indicates the type of altitude constraint.

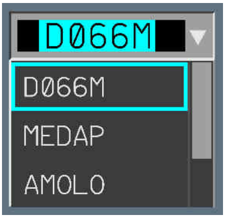
The type of altitude constraint can be one of the following:
- CLB: The altitude constraint is a climb altitude constraint
- DES: The altitude constraint is a descent altitude constraint.

If the FMS cannot determine the type of altitude constraint, the ALT CSTR type option list appears next to the ALT CSTR entry field. The ALT CSTR type option list enables the flight crew to select the desired type of altitude constraint (*Refer to ALT CSTR Type Option List*).

Ident.: DSC-22-FMS-20-20-20-390-00004355.0001001 / 14 APR 14

ALT CSTR AT LIST

Indicates the revised waypoint.
The revised waypoint is the waypoint on which the altitude constraint will be inserted.
The flight crew enters the ident of the revised waypoint via the keyboard, or by selecting the ident from the ALT CSTR AT list.
The ALT CSTR AT list displays all of the possible waypoints on which an altitude constraint can be inserted.



ALT CSTR AT List

By default, the selected revised waypoint is the waypoint of the F-PLN page from which the flight crew accessed the ALT panel.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 WAYPOINT.

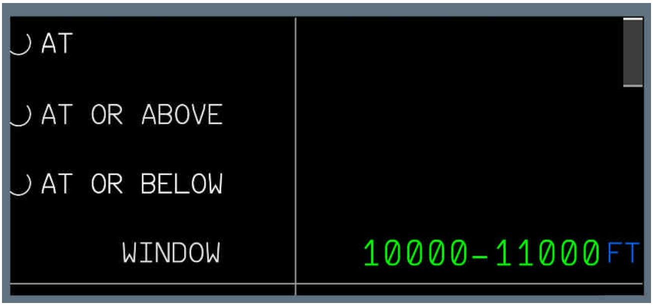
Ident.: DSC-22-FMS-20-20-20-390-00004356.0001001 / 14 APR 14

ALT CSTR OPTION LIST

The flight crew selects the category of altitude constraint, by selecting one of the following options:
- AT
- AT OR ABOVE
- AT OR BELOW.

When one of the three options is selected, the associated ALT CSTR entry field is displayed (*Refer to ALT CSTR Entry Field*).
The navigation database may have a window altitude constraint that is associated with the revised waypoint. In this case, the window altitude constraint appears below the ALT CSTR option list, and is selected by default.

Window Altitude Constraint



Note: *1. After selecting the AT, AT OR ABOVE, or AT OR BELOW option, the flight crew cannot select the window altitude constraint again.*
2. The flight crew cannot manually create a window altitude constraint.

Ident.: DSC-22-FMS-20-20-20-390-00004357.0001001 / 14 APR 14

ALT CSTR ENTRY FIELD

The flight crew enters the altitude constraint in the entry field.

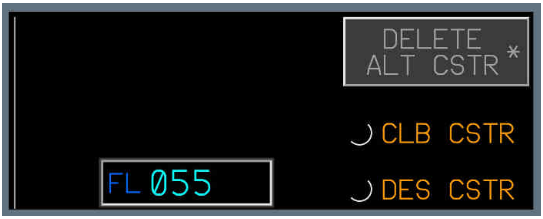
ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ALT.

Ident.: DSC-22-FMS-20-20-20-390-00004358.0001001 / 14 APR 14

ALT CSTR TYPE OPTION LIST

ALT CSTR Type Option List



The flight crew selects the applicable type of altitude constraint, by selecting one of the following options:
- CLB CSTR: The altitude constraint is a climb altitude constraint
- DES CSTR: The altitude constraint is a descent altitude constraint.

The ALT CSTR type option list is displayed, only if the FMS cannot automatically determine the type of altitude constraint.

Ident.: DSC-22-FMS-20-20-20-390-00004360.0001001 / 22 APR 14

DELETE ALT CSTR BUTTON

When clicked, deletes the altitude constraint, and creates(updates) the temporary flight plan.

Ident.: DSC-22-FMS-20-20-20-390-00004359.0001001 / 14 APR 14

ALT ERROR

If applicable, indicates the altitude error.
The altitude error is the difference between the predicted altitude at the revised waypoint and the altitude constraint at the revised waypoint.

The altitude error can be positive or negative:
- If the altitude error is positive, the aircraft will be above the requested AT, AT OR BELOW, or WINDOW constraint
- If the altitude error is negative, the aircraft will be below the requested AT, AT OR ABOVE, or WINDOW constraint.

L2 The following illustration explains the logic for the display of the altitude error.

CRZ

Indicates the cruise flight level of the active flight plan.

Ident.: DSC-22-FMS-20-20-20-390-00004363.0001001 / 24 APR 14

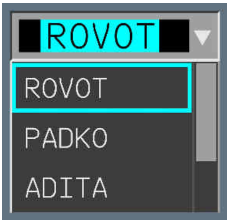
WPT LIST

Indicates the step start waypoint.

The flight crew enters the step start waypoint:
- By selecting the ident of the start waypoint from the WPT list, or
- Via the keyboard, by:
  - Entering the ident of the start waypoint, or
  - Entering a place/distance.
    The flight crew can enter a place/distance, only if the flight crew previously entered a step altitude in the ALT entry field on the same line.

The WPT list displays the flight-plan cruise waypoints that are after the aircraft present position.

WPT List



By default, the selected start waypoint for a new step is the revised waypoint. The revised waypoint is the waypoint of the F-PLN page from which the flight crew accessed the STEP ALTs panel.
If the flight crew selects the optimum step point as the step start waypoint, the entry field of the WPT list displays (OPT).

ENTRY FORMAT

For the entry format of:
- Waypoint ident, *Refer to DSC-22-FMS-20-80 WAYPOINT*
- Place/distance, *Refer to DSC-22-FMS-20-80 PLACE/DISTANCE (PD)*.

Ident.: DSC-22-FMS-20-20-20-390-00004364.0001001 / 17 APR 14

ALT ENTRY FIELD

The flight crew enters the step altitude in the entry field.

ENTRY FORMAT

Refer to DSC-22-FMS-20-80 ALT.

Ident.: DSC-22-FMS-20-20-20-390-00004333.0001001 / 22 APR 14

UTC(TIME) LABEL

Indicates the time reference:
- The UTC label indicates that the time reference is the UTC time
- The TIME label indicates that the time reference is the flight time.

L2 The time reference is defined as follows:
- In the PREFLIGHT flight phase:
  - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - If the UTC time is valid, the time reference is the UTC time
  - If the UTC time is not valid, the time reference is the flight time.

Ident.: DSC-22-FMS-20-20-20-390-00004366.0001001 / 22 APR 14

PREDICTIONS

Indicate the following predictions:
- The distance to the step start waypoint, along the flight plan
- The ETA, in UTC(flight) time, at the step start waypoint.

Ident.: DSC-22-FMS-20-20-20-390-00004365.0001001 / 22 APR 14

INFORMATION LABEL

L12

IGNORED	Indicates that the step is ignored. For information about ignored steps, *Refer to DSC-22-FMS-10-40-30 Purpose*.
ABOVE MAX FL	Indicates that the step is above the recommended maximum flight level.

Ident.: DSC-22-FMS-20-20-20-390-00004368.0001001 / 22 APR 14

STEP ALTS MESSAGE AREA

The STEP ALTs message area displays the following message:

STEP NOT ALLOWED AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of the revised waypoint.) Indicates that the flight crew cannot insert a step altitude at the XXXXXXX waypoint.

Ident.: DSC-22-FMS-20-20-20-390-00004367.0001001 / 22 APR 14

SCROLL BUTTONS

The flight crew uses the scroll down(up) button to move, page by page, downward(upward) through the list of step altitudes.

Ident.: DSC-22-FMS-20-20-20-390-00004369.0001001 / 22 APR 14

OPTIMUM STEP POINT AREA

NO STEP IN THE FLIGHT PLAN

When there is no step in the flight plan, the OPTIMUM STEP POINT area displays the TO entry field.

Predictions

Indicate the following predictions:
- The distance to the optimum step point, along the flight plan
- The ETA, in UTC(flight) time, at the optimum step point.

L2 These distance and time predictions are not displayed, when the optimum step point is inserted in the active (or temporary) flight plan.

L1 ΔFUEL and ΔTIME

Indicate the following data:
- The quantity of fuel that will be saved or added, if the step with the optimum step point is inserted in the flight plan
- The time that will be saved or added, if the step with the optimum step point is inserted in the flight plan.

A minus sign means that some fuel or time will be saved.
A plus sign means that there will be an additional fuel or time cost.

INSERT AS OPT Button

When clicked, inserts the optimum step point in the temporary flight plan, and displays the OPTIMUM SELECTED label.
The label of the button changes from INSERT AS OPT to NEW SEARCH.

PURPOSE

On the WHAT IF page, the flight crew can enter and display the parameters that the FMS uses to simulate the WHAT IF event. The WHAT IF event can be:
- An engine-out that occurs during the CRZ flight phase, or
- Depressurization that occurs during the CRZ flight phase.

The WHAT IF page enables the flight crew to assess the capability of the aircraft to reach the destination airport of the flight plan, in the case of the WHAT IF event.
The WHAT IF page is available for the secondary flight plans only.

Note: *The FMS cannot simulate more than one WHAT IF event at a time for one secondary flight plan. However, the flight crew can select one WHAT IF event for each of the three secondary flight plans at the same time. The WHAT IF event can be different for each secondary flight plan.*

LINKS

For information about the WHAT IF function, *Refer to DSC-22-FMS-10-40-40 WHAT IF Function*.

Ident.: DSC-22-FMS-20-20-20-400-00013259.0001001 / 14 APR 14

WHAT IF MESSAGE AREA

The WHAT IF message area displays the following messages (only one message appears at a time):

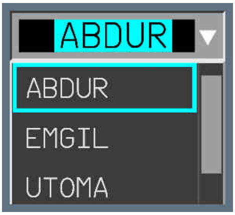
EXISTING WHAT IF AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of a waypoint.) Indicates that: - The flight plan already has a WHAT IF event that is simulated at the XXXXXXX waypoint - The XXXXXXX waypoint is different from the revised waypoint that the flight crew selected to simulate the WHAT IF event. The secondary flight plan can have only one WHAT IF scenario. Therefore, in order to simulate a WHAT IF event at the revised waypoint, the flight crew must first cancel the WHAT IF scenario that currently applies to the secondary flight plan.
WHAT IF NOT ALLOWED AT XXXXXXX	(The "XXXXXXX" corresponds to the ident of the revised waypoint.) Indicates that the FMS cannot simulate a WHAT IF event at the XXXXXXX waypoint.

Ident.: DSC-22-FMS-20-20-20-400-00013552.0001001 / 14 APR 14

AT LIST

Indicates the revised waypoint.
The revised waypoint is the waypoint at which the FMS simulates the WHAT IF event.
The revised waypoint is a cruise waypoint of the flight plan.
The WHAT IF event applies to the secondary flight plan from the revised waypoint to the last waypoint of the CRZ flight phase.
The flight crew selects the revised waypoint from the AT list.
The AT list displays all of the possible waypoints at which the FMS can simulate a WHAT IF event.

AT List



By default, the revised waypoint is one of the following:
- The waypoint of the SEC/F-PLN page from which the flight crew accessed the WHAT IF page
- P.POS, if all of the following apply:
  - The flight crew accessed the WHAT IF page via the SEC INDEX page
  - The secondary flight plan contains no WHAT IF scenario
  - The active flight phase is CRZ, and the flight crew used a copy of the active flight plan to create the secondary flight plan
- The first cruise waypoint of the secondary flight plan, if all of the following apply:
  - The flight crew accessed the WHAT IF page via the SEC INDEX page
  - The secondary flight plan contains no WHAT IF scenario
  - The active flight phase is not CRZ, or the flight crew did not use a copy of the active flight plan to create the secondary flight plan
- The cruise waypoint of the flight plan at which there is a WHAT IF scenario, if all of the following apply:
  - The flight crew accessed the WHAT IF page via the SEC INDEX page
  - The secondary flight plan contains a WHAT IF scenario.

L3 The entry field of the AT list displays dashes, if the secondary flight plan contains no cruise waypoints.

L13

Note: 1. *If the flight crew selects P.POS as the revised waypoint, the WHAT IF scenario will apply until the end of the CRZ flight phase. However, if the revised waypoint is a cruise waypoint of the flight plan that is not P.POS, the FMS will automatically cancel the WHAT IF scenario, as soon as the aircraft sequences the revised waypoint.*

2. *The WHAT IF message area displays the EXISTING WHAT IF AT XXXXXXX message (the "XXXXXXX" corresponds to a waypoint ident), if all of the following occur:*
   - *The secondary flight plan already contains a WHAT IF scenario at the XXXXXXX waypoint*
   - *The flight crew selects a waypoint, from the AT list, that is not the XXXXXXX waypoint.*

Ident.: DSC-22-FMS-20-20-20-400-00013553.0001001 / 22 APR 14

WHAT IF OPTION LIST

The flight crew uses the WHAT IF option list to select the WHAT IF event that they want to simulate at the revised waypoint.

The WHAT IF option list has the following options:
- ENGINE OUT: The WHAT IF event is an engine-out
  When selected, displays the ENGINE OUT scenario (*Refer to ENGINE OUT Scenario*).
- DEPRESSURIZATION: The WHAT IF event is depressurization.
  When selected, displays the DEPRESSURIZATION scenario (*Refer to DEPRESSURIZATION Scenario*).

L2 *Note:* *If the predicted altitude at the revised waypoint is below FL 100, the DEPRESSURIZATION option is not available.*

Ident.: DSC-22-FMS-20-20-20-400-00013554.0001001 / 05 MAY 14

ENGINE OUT SCENARIO

Indicates:
- The scenario that corresponds to the selected WHAT IF event: An engine-out
- The scenario parameters that the FMS uses to compute all predictions
- The fuel and time predictions at destination, based on the scenario parameters.

For the ENGINE OUT scenario, the FMS computes the GDOT Engine-Out Maximum Flight Level (GDOT EO MAX FL).

The GDOT EO MAX FL is the maximum flight level at which the aircraft can:
- Level off at EO-GDOT speed
- Begin to accelerate toward the EO-LRC speed.

The displayed ENGINE OUT scenario depends on the predicted altitude at the revised waypoint:
- If the predicted altitude at the revised waypoint is above the GDOT EO MAX FL, the scenario includes a drift-down procedure
- If the predicted altitude at the revised waypoint is below the GDOT EO MAX FL, the scenario includes a cruise at the predicted altitude of the revised waypoint.

CRUISE AT Entry Field

DEST

Below GDOT EO MAX FL

EO MAX [WHAT IF EVENT ABOVE GDOT EO MAX FL]

Indicates the LRC EO MAX FL that is predicted at the revised waypoint.
The LRC EO MAX FL is the maximum flight level at which the aircraft is able to level off at EO-LRC speed.

L2 For more information about the LRC EO MAX FL, *Refer to DSC-22-FMS-10-60 LRC Engine-Out Maximum Flight Level (LRC EO MAX FL)*.

L1

EO MAX [WHAT IF EVENT BELOW GDOT EO MAX FL]

Indicates the GDOT EO MAX FL that is predicted at the revised waypoint.

DRIFT DOWN AT GDOT

Indicates that the ENGINE OUT scenario includes a drift-down procedure at EO-GDOT speed.

EO MAX/IN

Indicate:
- The GDOT EO MAX FL that is predicted at the end of the drift-down procedure
- The distance, from the revised waypoint, to reach the GDOT EO MAX FL.

CRUISE AT ENTRY FIELD [WHAT IF EVENT ABOVE GDOT EO MAX FL]

Indicates the cruise flight level at which the aircraft flies, when the ENGINE OUT scenario applies.
By default, the cruise flight level is the GDOT EO MAX FL that is predicted at the end of the drift-down procedure.
The flight crew can overwrite the default value.

L13

Note: 1. *The cruise flight level must be below the GDOT EO MAX FL. If the flight crew enters a cruise flight level that is above the GDOT EO MAX FL, the FMS message area displays the* ENTRY ABOVE EO MAX FL *message (Refer to message).*
2. *The cruise flight level must be above the following minimum altitude: Altitude of the destination airport of the secondary flight plan plus 1 500 ft. If the flight crew enters a cruise flight level that is below this minimum altitude, the FMS message area displays the* ENTRY OUT OF RANGE *message (Refer to message).*

The default value reappears, if the flight crew clears the manually-entered value.
The manually-entered value automatically reverts to the default value, if the manually-entered value goes above the GDOT EO MAX FL (due to a gross weight modification, for example).

Entry Format

Refer to DSC-22-FMS-20-80 CRZ FL.

CRUISE AT ENTRY FIELD [WHAT IF EVENT BELOW GDOT EO MAX FL]

Indicates the cruise flight level at which the aircraft flies, when the ENGINE OUT scenario applies.
By default, the cruise flight level is the cruise flight level that is predicted at the revised waypoint.
The flight crew can overwrite the default value.

L13

Note: 1. *The cruise flight level must be below the GDOT EO MAX FL. If the flight crew enters a cruise flight level that is above the GDOT EO MAX FL, the FMS message area displays the ENTRY ABOVE EO MAX FL message (Refer to message).*
2. *The cruise flight level must be above the following minimum altitude: Altitude of the destination airport of the secondary flight plan plus 1 500 ft. If the flight crew enters a cruise flight level that is below this minimum altitude, the FMS message area displays the ENTRY OUT OF RANGE message (Refer to message).*

The default value reappears, if the flight crew clears the manually-entered value.
The manually-entered value automatically reverts to the GDOT EO MAX FL, if the manually-entered value goes above the GDOT EO MAX FL (due to a gross weight modification, for example).

Entry Format

Refer to DSC-22-FMS-20-80 CRZ FL.

DEST

Indicates:
- The ident of the destination airport of the secondary flight plan
- The Estimated Time of Arrival (ETA), in UTC(flight) time, at the destination airport of the secondary flight plan

L2

The time reference is defined as follows:
- In the PREFLIGHT flight phase:
  - If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - If the UTC time is valid, the time reference is the UTC time
  - If the UTC time is not valid, the time reference is the flight time.

L1

The FMS computes this ETA, based on the displayed and entered parameters of the WHAT IF scenario.
- The Estimated Fuel On Board (EFOB) at the destination airport of the secondary flight plan. The FMS computes this EFOB, based on the displayed and entered parameters of the WHAT IF scenario.

Note: *The EFOB value is always displayed in white (even if the value is negative).*

DEPRESSURIZATION SCENARIO

Indicates:
- The scenario that corresponds to the selected WHAT IF event: Depressurization
- The scenario parameters that the FMS uses to compute the predictions
- The fuel and time predictions at destination, based on the scenario parameters.

DEST WSSS 22:20 -24.5 T

EMERGENCY DESCENT

Indicates that the DEPRESSURIZATION scenario includes an emergency descent.

LEVEL OFF AT ENTRY FIELD

Indicates the cruise flight level at which the aircraft flies, when the DEPRESSURIZATION scenario applies.
By default, the cruise flight level is FL 100.
The flight crew can overwrite the default value.

L13

Note: *1. The cruise flight level must be below the predicted altitude at the revised waypoint. If the flight crew enters a cruise flight level that is above the predicted altitude at the revised waypoint, the FMS message area displays the ENTRY OUT OF RANGE message (Refer to message).*
2. The cruise flight level must be above the following minimum altitude: Altitude of the destination plus 1 500 ft. If the flight crew enters a cruise flight level that is below this minimum altitude, the FMS message area displays the ENTRY OUT OF RANGE message (Refer to message).

The default value reappears, if the flight crew clears the manually-entered value.

DEST

Indicates:
- The ident of the destination airport of the secondary flight plan
- The Estimated Time of Arrival (ETA), in UTC(flight) time, at the destination airport of the secondary flight plan

L2 The time reference is defined as follows:
- In the PREFLIGHT flight phase:
  - ■ If there is an entered Estimated Takeoff Time (ETT), the time reference is the UTC time
  - ■ If there is no entered ETT, the time reference is the flight time

  The flight crew enters the ETT on the RTA panel of the VERT REV page (*Refer to page*).
- In flight:
  - ■ If the UTC time is valid, the time reference is the UTC time
  - ■ If the UTC time is not valid, the time reference is the flight time.

L1 The FMS computes this ETA, based on the displayed and entered parameters of the WHAT IF scenario.
- The Estimated Fuel On Board (EFOB) at the destination airport of the secondary flight plan. The FMS computes this EFOB, based on the displayed and entered parameters of the WHAT IF scenario.

Note: *The EFOB value is always displayed in white (even if the value is negative).*

RETURN BUTTON

When clicked, displays the page that was displayed before the WHAT IF page.

Ident.: DSC-22-FMS-20-20-20-400-00013557.0001001 / 22 APR 14

WIND BUTTON

When clicked, displays the SEC/WIND page (*Refer to page*).

L2 The CRZ panel opens by default.

Ident.: DSC-22-FMS-20-20-20-400-00013558.0001001 / 14 APR 14

CANCEL WHAT IF BUTTON

When clicked:
- Cancels the WHAT IF scenario in the secondary flight plan
- Displays the SEC/F-PLN page (*Refer to page*).

L12

Note: *The FMS automatically cancels the WHAT IF scenario in the secondary flight plan, if one of the following occurs:*
- *The revised waypoint at which the FMS simulated the WHAT IF event was not P.POS, and the aircraft sequences this revised waypoint*
- *The flight crew uses the SWAP function (i.e. the secondary flight plan becomes the active flight plan, and vice versa)*
- *The revised waypoint at which the FMS simulated the WHAT IF event is no longer a cruise waypoint of the flight plan.*
- *The EO mode becomes active.*

PURPOSE

The WIND page enables the flight crew to:
- Insert climb, cruise, and descent winds
- Insert cruise temperatures

- Insert the alternate trip wind
- Insert (or clear) the received company wind data.

The WIND page also displays the history winds on the HISTORY panel.
The WIND page is available for the active and secondary flight plans.
The SEC/WIND page has no HISTORY panel.

LINKS

For information about the WIND revision, *Refer to DSC-22-FMS-10-40-30 Purpose*.

RETURN BUTTON

When clicked, displays the page that was displayed before the WIND page.

L2 If the flight crew accesses the WIND page via the general menu bar, the RETURN button does not appear.

Ident.: DSC-22-FMS-20-20-20-410-00004373.0001001 / 14 APR 14

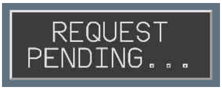
CPNY WIND REQUEST BUTTON

When clicked:

- If the free text AMI option is not activated, sends a company wind request to the company ground station (via ACARS)
- If the free text AMI option is activated, displays the COMPANY WIND DATA REQUEST page (*Refer to page*).
  On the COMPANY WIND DATA REQUEST page, the flight crew can enter free text that will be sent with the wind request.

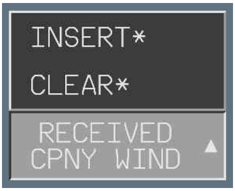
When a request for an active wind is in progress, the button label is REQUEST PENDING... . When clicked, still displays the COMPANY WIND DATA REQUEST page.

REQUEST PENDING...



When company wind data is received, the button label is RECEIVED CPNY WIND. When clicked, opens a menu that enables the flight crew to insert or clear the received company wind.

RECEIVED CPNY WIND



Ident.: DSC-22-FMS-20-20-20-410-00004375.0001001 / 22 APR 14

INSERT WIND BUTTON

When clicked, inserts the climb, cruise, and descent temporary winds and temperatures.

L2 Inserting, changing, or deleting wind data creates a set of temporary winds. The temporary winds are not considered for prediction computation, before they are inserted.
The DRAFT label indicates that there is a set of temporary winds (*Refer to DRAFT Label*).

L1 *Note:* *When temporary winds are on standby and the FMS creates a temporary flight plan (by a flight plan revision other than the WIND revision), the temporary winds are automatically inserted in the active and temporary flight plans.*

Ident.: DSC-22-FMS-20-20-20-410-00004376.0001001 / 14 APR 14

CANCEL WIND BUTTON

When clicked, cancels the climb, cruise, and descent temporary winds and temperatures. After canceling the temporary winds, the WIND page displays the inserted winds that were considered before the wind update.

L2 Inserting, changing, or deleting wind data creates a set of temporary winds. The temporary winds are not considered for prediction computation, before they are inserted.
The DRAFT label indicates that there is a set of temporary winds (*Refer to DRAFT Label*).

L1 *Note:* *When temporary winds are on standby and the FMS creates a temporary flight plan (by a flight plan revision other than the WIND revision), the temporary winds are automatically inserted in the active and temporary flight plans.*

Ident.: DSC-22-FMS-20-20-20-410-00004377.0001001 / 14 APR 14

ALT AND T.WIND

Indicate the history winds.
The history winds are the descent winds that were stored from the previous flight.
Winds are measured and stored for the CRZ FL, FL 250, FL 150, and FL 050.
The wind format is: Wind direction (true north reference) / Wind speed.
In preflight, the flight crew can insert the history winds of the previous flight as the climb winds for the next flight, with the INSERT HISTORY WIND button (*Refer to INSERT HISTORY WIND Button*).

L2 The history winds are only available for the active flight plan.

Ident.: DSC-22-FMS-20-20-20-410-00004378.0001001 / 22 APR 14

INSERT HISTORY WIND BUTTON

When clicked, inserts the history winds as the climb winds of the active flight plan, and displays the CLB panel of the WIND page.

Note:
1. *When the flight crew insert history winds, the FMS does not create temporary climb winds. The winds are directly inserted in the active flight plan.*
2. *The flight crew cannot insert the history winds, when temporary winds or a temporary flight plan are on standby.*

Ident.: DSC-22-FMS-20-20-20-410-00004380.0001001 / 22 APR 14

DRAFT LABEL

Indicates (on the CLB, CRZ, and DES panels) that temporary winds are on standby.
Inserting, changing, or deleting wind data creates a set of temporary winds. The temporary winds are not considered for prediction computation, before they are inserted.

Ident.: DSC-22-FMS-20-20-20-410-00004379.0001001 / 14 APR 14

ALT AND T.WIND ENTRY FIELDS [CLB]

Indicate the climb winds that are associated with a maximum of 5 altitudes or flight levels.
Inserted history winds are displayed in small font.
Inserted company wind uplinks and wind data that the flight crew enters are displayed in large font.

L2 The climb winds can be entered or changed only when all of the following apply:
- The active flight phase is the PREFLIGHT flight phase
- There is no temporary flight plan on standby.

L1 ALT ENTRY FIELD

Indicates a climb altitude:
- In feet, if the altitude is below the transition altitude
- In flight level, if the altitude is above the transition altitude.

The flight crew can enter a surface wind, by entering an altitude less than 400 ft, or by entering GND in the entry field.

Entry Format

Refer to DSC-22-FMS-20-80 WIND ALTITUDE.

T.WIND ENTRY FIELDS

Indicate the wind direction (true north reference) and the wind speed.

Entry Format

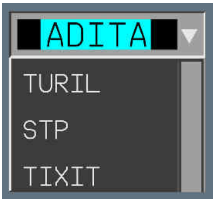
For the entry format of:
- Wind direction, *Refer to DSC-22-FMS-20-80 WIND DIRECTION*
- Wind speed, *Refer to DSC-22-FMS-20-80 WIND SPEED*.

Ident.: DSC-22-FMS-20-20-20-410-00004381.0001001 / 14 APR 14

CRZ WIND AT LIST

Indicates the cruise waypoint with which the displayed wind and temperature data are associated.
The flight crew selects the cruise waypoint from the CRZ WIND AT list.
The CRZ WIND AT list displays all cruise waypoints of the destination flight plan (between the T/C and the T/D).

CRZ WIND AT List



Ident.: DSC-22-FMS-20-20-20-410-00004382.0001001 / 22 APR 14

WAYPOINT SCROLL BUTTONS

The flight crew uses the scroll down(up) button to display the wind and temperature data of the next down-path(previous up-path) cruise waypoint, without opening the CRZ WPT AT list.

Note: *When the cursor is on the CRZ panel of the WIND page, the KCCU wheel has the same function as the scroll buttons: Scrolling down(up) the wheel displays the next down-path(previous up-path) cruise waypoint and the associated wind data.*

Ident.: DSC-22-FMS-20-20-20-410-00004383.0001001 / 14 APR 14

ALT AND T.WIND ENTRY FIELDS [CRZ]

Indicate the cruise winds that are associated with a maximum of four flight levels.

L2 The cruise winds can be entered, only if no temporary flight plan is on standby.

L1 ALT ENTRY FIELD

Indicates a cruise flight level.
When the flight crew enters an altitude, the altitude is propagated to all (up-path and down-path) cruise waypoints. The flight crew can change this altitude only on the waypoint on which it was defined, and not on the waypoints where the altitude was propagated. If the waypoint is sequenced, the flight crew can change the altitude value on the next down-path waypoint.

Entry Format

Refer to DSC-22-FMS-20-80 WIND ALTITUDE.

T.WIND ENTRY FIELDS

Indicate the wind direction (true north reference) and the wind speed.
When the flight crew enters a wind direction and a wind speed, these direction and speed are propagated to the down-path cruise waypoints, until the waypoint for which the flight crew entered different wind data for the same flight level.
The flight crew can always change, but not clear, propagated wind data.

Propagated wind data is displayed in small font. Wind data that the flight crew enters is displayed in large font.

Entry Format

For the entry format of:
- Wind direction, *Refer to DSC-22-FMS-20-80 WIND DIRECTION*
- Wind speed, *Refer to DSC-22-FMS-20-80 WIND SPEED*.

EXAMPLE

Step 1

The flight crew enters a wind altitude, a wind direction, and a wind speed at ADITA:
- The wind altitude (FL 320) is propagated to all waypoints, and this altitude can be changed at only ADITA
- The wind direction and wind speed (320 °/050 kt) are propagated to all down-path waypoints, and can be changed at all down-path waypoints.

ALT AND SAT ENTRY FIELDS

Indicate a flight level and the associated Static Air Temperature (SAT).
The flight crew enters the altitude and SAT to define a temperature profile for prediction computation.

L2 The FMS defines an estimated temperature profile that is based on the difference between a reference temperature profile and a measured or entered SAT at different altitudes.
The reference temperature profile is defined by the tropopause altitude that is entered on the INIT page. The default tropopause altitude is the ISA tropopause.
The flight crew defines the deviation from the reference temperature profile, for the cruise waypoints, by entering the SAT that is associated with an altitude.

L1 The temperature is propagated to the down-path cruise waypoints in the same manner as the wind data.

ENTRY FORMAT

For the entry format of:
- SAT altitude, *Refer to DSC-22-FMS-20-80 SAT ALTITUDE*
- SAT, *Refer to DSC-22-FMS-20-80 SAT*.

Ident.: DSC-22-FMS-20-20-20-410-00004386.0001001 / 14 APR 14

ALT AND T.WIND ENTRY FIELDS [DES]

Indicate the descent winds that are associated with a maximum of 5 altitudes or flight levels.

L2 The descent winds cannot be entered or changed, when one of the following apply:
- The active flight phase is the DES, APPR, or GA flight phase
- There is a temporary flight plan on standby.

L1 **ALT ENTRY FIELD**

Indicates the descent altitude:
- In feet, if the altitude is below the transition altitude
- In flight level, if the altitude is above the transition altitude.

The flight crew can enter a surface wind, by entering an altitude less than 400 ft, or by entering GND in the entry field.

Entry Format

Refer to DSC-22-FMS-20-80 WIND ALTITUDE.

T.WIND ENTRY FIELDS

Indicate the wind direction (true north reference) and the wind speed.

Note: *1. The FMS automatically synchronizes all of the following:*
- *The surface wind in the T.WIND entry fields of the DES panel of the ACTIVE/WIND page*
- *The MAG WIND entry fields of the DES panel of the ACTIVE/PERF page (Refer to page).*

2. The FMS automatically synchronizes all of the following:
- *The surface wind in the T.WIND entry fields of the DES panel of the SEC1(2)(3)/WIND page*
- *The MAG WIND entry fields of the DES panel of the SEC1(2)(3)/PERF page (Refer to page).*

3. In order to synchronize the entry fields, if the north reference is not the same on the PERF page and on the WIND page, the FMS uses the magnetic variation at the destination airport to change north wind from magnetic wind, and vice versa.

Entry Format

For the entry format of:
- Wind direction, *Refer to DSC-22-FMS-20-80 WIND DIRECTION*
- Wind speed, *Refer to DSC-22-FMS-20-80 WIND SPEED*.

Ident.: DSC-22-FMS-20-20-20-410-00004387.0001001 / 14 APR 14

ALTN TRIP WIND ALTITUDE

Indicates the alternate cruise flight level:
- If the alternate flight plan distance is less than 200 NM, the alternate cruise flight level is FL220
- If the alternate flight plan distance is 200 NM or more, the alternate cruise flight level is FL310.

The flight crew cannot change the alternate cruise flight level.

Ident.: DSC-22-FMS-20-20-20-410-00004388.0001001 / 14 APR 14

ALTN TRIP WIND ENTRY FIELDS

Indicate the alternate trip wind direction (true north reference) and speed.
L2 The alternate wind can be entered, only if no temporary flight plan is on standby.

L1 ENTRY FORMAT

For the entry format of:
- Wind direction, *Refer to DSC-22-FMS-20-80 WIND DIRECTION*
- Wind speed, *Refer to DSC-22-FMS-20-80 WIND SPEED*.

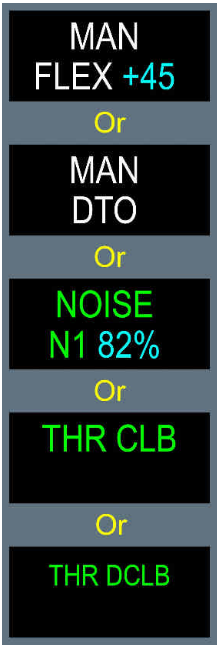
A/THR MODES



The Flight Mode Annunciator (FMA) displays the A/THR mode. The A/THR mode can be associated with one of the following thrust settings:

- FLX thrust or DTO thrust, as selected on the T.O panel of the ACTIVE/PERF page
- NOISE thrust, as selected on the T.O or CLB panel of the ACTIVE/PERF page
- CLB thrust or DCLB climb thrust, as selected on the CLB panel of the ACTIVE/PERF page.

For more information about:

- The display conditions of the above-listed A/THR modes on the FMA, and information about all A/THR modes on the FMA, *Refer to DSC-22-FG-90-80 A/THR Messages and Modes (Column 1)*
- The ACTIVE/PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

Ident.: DSC-22-FMS-20-40-10-00005211.0001001 / 22 APR 14

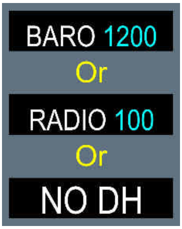
FMS MESSAGES

The third line of the FMA displays the following FMS messages:

- CHECK APPR SEL (*Refer to message*)
- CHECK EO SPD SETTING (*Refer to message*)
- EXTEND SPD BRK (*Refer to message*)
- NO NAV INTERCEPTION (*Refer to message*)
- NO VERT PATH INTERCEPT (*Refer to message*)
- RETRACT SPD BRK (*Refer to message*)
- SET HOLD SPD (*Refer to message*)
- T/D REACHED (*Refer to message*).

Ident.: DSC-22-FMS-20-40-10-00005212.0001001 / 22 APR 14

MINIMUM

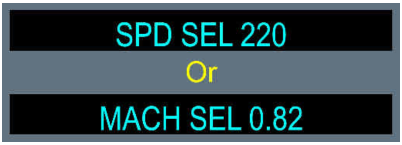


Indicates the required minimum altitude that is applicable to the approach procedure, as entered on the APPR panel of the ACTIVE/PERF page.

For more information about:
- The display of the required minimum altitude on the FMA, *Refer to DSC-22-FG-90-80 Minimum Descent Height/Altitude, or Decision Height (Column 4)*
- The ACTIVE/PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

Ident.: DSC-22-FMS-20-40-10-00005213.0001001 / 04 DEC 14

AFS MESSAGES



The FMA displays the preselected speed(Mach), as entered on the CLB or CRZ panel of the ACTIVE/PERF page.

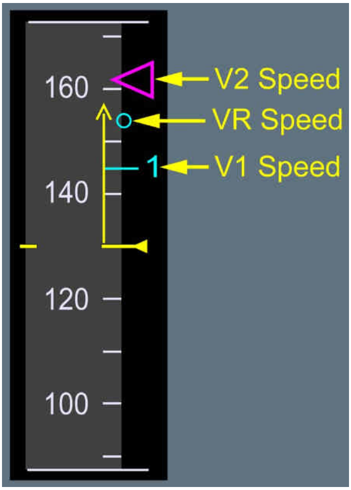
For more information about:
- The display of the AFS messages on the FMA, *Refer to DSC-22-FG-90-80 AFS Messages (Line 3)*
- The ACTIVE/PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

Ident.: DSC-22-FMS-20-40-10-00005214.0001001 / 14 APR 14

AIRSPEED INDICATIONS

The PFD airspeed scale displays the following FMS airspeed indications:
- The takeoff speeds
- The managed speed target
- The short-term managed speed.

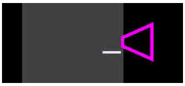
TAKEOFF SPEEDS



The PFD airspeed scale displays V1, VR, and V2, as entered on the T.O panel of the ACTIVE/PERF page.

For more information about:
- The display of airspeed indications on the PFD, *Refer to DSC-31-CDS-40-20-40 Airspeed Indications During Takeoff*
- The ACTIVE/PERF page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

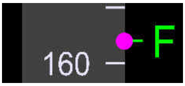
MANAGED SPEED TARGET



The FMS computes the managed speed target. The managed speed target appears as a magenta triangle on the PFD airspeed scale.

For more information about:
- The display of the managed speed target on the PFD airspeed scale, *Refer to DSC-31-CDS-40-20-40 General Airspeed Indications*
- The managed speed profile, *Refer to DSC-22-FMS-10-50-30 Overview*
- The managed speed/Mach target, *Refer to DSC-22-FG-60-20 Managed Speed/Mach Target*.

SHORT-TERM MANAGED SPEED



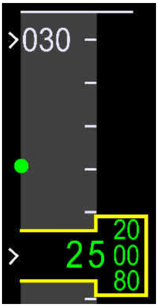
The FMS computes the short-term managed speed. The short-term managed speed appears as a magenta dot on the PFD airspeed scale. For more information about the short-term managed speed, *Refer to DSC-22-FG-60-20 Short-Term Managed Speed*.

Ident.: DSC-22-FMS-20-40-10-00005217.0001001 / 22 APR 14

VERTICAL DEVIATION

The FMS computes the vertical deviation. The vertical deviation is the difference between the current altitude of the aircraft and the FMS vertical profile.
The symbol that indicates the vertical deviation appears either on the PFD altitude scale, or on the PFD deviation scale.

Note: *The flight crew can display the numeric value of the vertical deviation on the DES and APPR panels of the ACTIVE/PERF page (Refer to page).*



On the PFD altitude scale, a green dot indicates the altitude of the FMS vertical profile.

This green dot is displayed:
- At and after the T/D
- During the DES flight phase
- During the APPR flight phase, if the approach is not an RNAV (RNP) approach.

For more information about the display of the vertical deviation on the PFD altitude scale, *Refer to DSC-31-CDS-40-20-50 Vertical Deviation*.

On the PFD deviation scale, a green rectangle indicates the vertical deviation.
This green rectangle is displayed during an RNAV (RNP) VIA or an RNAV(RNP) approach.

Ident.: DSC-22-FMS-20-40-10-00013666.0001001 / 22 APR 14

LATERAL DEVIATION

The FMS computes the lateral deviation. The lateral deviation is also referred to as the crosstrack error. The lateral deviation is the difference between the current aircraft position and the lateral flight plan of the FMS.
The symbol that indicates the lateral deviation appears on the PFD deviation scale.

Note: *The ND displays the numeric value of the lateral deviation. For more information about the display of the lateral deviation on the ND, Refer to DSC-31-CDS-40-40-80 FMS Data Overview.*

A green rectangle indicates the lateral deviation.
This green rectangle is displayed during an RNP AR procedure.

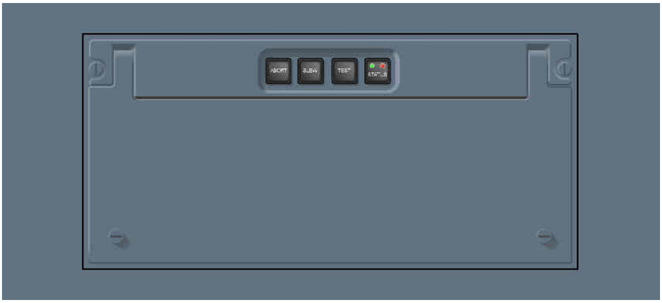
PRINTER

Ident.: DSC-22-FMS-20-75-00014188.0001001 / 22 APR 14
Applicable to: ALL

The PRINT function of the FMS uses the printer to print data and reports.

L2 For more information about the PRINT function, *Refer to DSC-22-FMS-10-90 Print Function*.

Printer



L1 For the description of the printer, *Refer to DSC-46-OIS-20-120 Overview*.

Intentionally left blank

HOW TO MANAGE FMS ERRONEOUS PREDICTIONS

Ident.: DSC-22-FMS-30-00025371.0001001 / 03 JUL 20
Applicable to: ALL

On ground or in flight, some FMS predictions could be temporary missing, or detected as erroneous. They may affect such data as ECON speed/Mach, T/D predictions, distances, fuel and time predictions.
The flight crew should not perform a reset of the FMC.

Note: *A FMC reset is without effect. It will restart the FMS, but it will not modify the conditions resulting in the erroneous or missing predictions.*

FOR MISSING PREDICTIONS OR OBVIOUS ERRONEOUS PREDICTIONS

To recover the FMS predictions:

1. On the WIND page, the flight crew should verify for each flight level:
   - The temperature value for each cruise waypoint
   - The wind data for each cruise waypoint.

   If some temperature or wind data are erroneous or missing the flight crew should:
   - Update data
   - Check if correct predictions are recovered.
2. In the legs of the Flight Plan, the flight crew should verify:
   - If there is one Flight Plan leg with erroneous predicted distance, or erroneous predicted time or erroneous predicted fuel consumption, and
   - If one Flight Plan leg with erroneous predictions exists, then the flight crew should:
     - Insert an intermediate waypoint
     - Check if correct predictions are recovered.

3. In the arrival procedure of the Flight Plan, the flight crew should verify:
   - If there is two successive waypoints separated by a distance of 3 NM or less, and
   - If one of these two waypoints contains an AT OR BELOW altitude constraint the flight crew should:
     - Insert the same altitude constraint to the lowest waypoint
     - Check if correct predictions are recovered.

1 FOR SUSPECTED ERRONEOUS PREDICTIONS OR TO FORCE A F-PLN RE-COMPUTATION

If the flight crew suspects that the FMS predictions are erroneous (slow computations, slightly erroneous values, ...) and if the previous actions remain not successful, in order to recover the FMS predictions, the flight crew should:

- Copy of the ACTIVE F-PLN into a SEC F-PLN
- Remove the STAR procedure of the ACTIVE F-PLN

  Note: *The STAR usually contains a lot of constraints which may disturb FMS predictions computations.*
- Insert again the STAR in the ACTIVE F-PLN, later during the flight.

HOW TO CHANGE DEPARTURE T.O DATA AFTER REJECTED TAKEOFF

Ident.: DSC-22-FMS-30-00025329.0001001 / 03 JAN 20
Applicable to: ALL

In case of rejected takeoff (with an aircraft speed above 90 kt or with sufficient thrust), the FMS remains in TAKEOFF phase and the flight crew cannot modify the FMS departure T.O Data in the active flight plan.

To change the FMS departure in the active flight plan, the flight crew:
- Uses an empty SEC F-PLN, or deletes a SEC F-PLN
- Initializes the SEC F-PLN with the appropriate inputs in the INIT/F-PLN/FUEL/PERF pages of the SEC F-PLN
- Uses the SWAP function in order to activate the secondary flight plan with the updated inputs.

The FMS remains in TAKEOFF phase but all the FMS data are updated and available for the new takeoff.

OVERVIEW

Applicable to: ALL

Ident.: DSC-22-FMS-40-10-00000522.0001001 / 04 SEP 14

NORMAL OPERATION

In normal operation:

- FMC-A provides data to FMS 1
- FMC-B provides data to FMS 2
- FMC-C is the backup FMC
- The FMS selector is set to NORM.

L2 FMC-A, FMC-B, and FMC-C are three identical computers, each able to complete all FMS tasks. However, FMC-A and FMC-B are assigned to a specific FMS side (i.e. FMC-A is assigned to FMS 1, and FMC-B is assigned to FMS 2), or to the standby position.

Note: *FMC-A cannot be assigned to FMS 2, and FMC-B cannot be assigned to FMS 1.*

In the case of an FMC-A or FMC-B failure, an automatic reconfiguration of the FMCs occurs, and FMC-C is assigned to either FMS 1 or FMS 2. For more information about abnormal operation, *Refer to Abnormal Operation*.

L1

DUAL MODE

In normal operation, FMS 1 and FMS 2 operate in DUAL mode: The two active FMCs independently calculate data, and then share, compare, and synchronize these data.

MASTER AND SLAVE FMC s

Of the two active FMCs, one FMC is referred to as the "master", and the other FMC is referred to as the "slave".
The Flight Guidance (FG) uses the long-term guidance data of the master FMC only.

L2 The master FMC provides some important FMS data to the slave FMC. For example:
- The FMS flight phase
- The AFS CP selected altitude
- The frequency and course of the landing system.

L1 The selection of the master FMC is based on which Autopilot (AP) is engaged, and on the position of the FMS selector. The position of the FMS selector has priority over the engaged AP.

Master FMS	Position of the FMS selector		
Engaged AP	**BOTH ON 2**	**NORM**	**BOTH ON 1**
AP 1	FMS 2	FMS 1	FMS 1
AP 2	FMS 2	FMS 2	FMS 1

When no AP is engaged and the FMS selector is in the NORM position, the FMC of FMS 1 is the master FMC.

L2 For more information about the FMS selector, *Refer to DSC-22-FMS-20-70 FMS Selector*

L1 BACKUP FMC

If FMC-A or FMC-B fails, FMC-C is able to take over and to provide data for either FMS 1 or FMS 2. For more information about abnormal operation, *Refer to Abnormal Operation*.
The backup FMC also independently achieves some simple calculations.

L2 During an RNP AR procedure, the backup FMC also computes lateral deviation. For more information, *Refer to DSC-22-FMS-10-30-50 LDEV and VDEV computation*.

L1 In normal operation, FMC-C is the backup FMC.

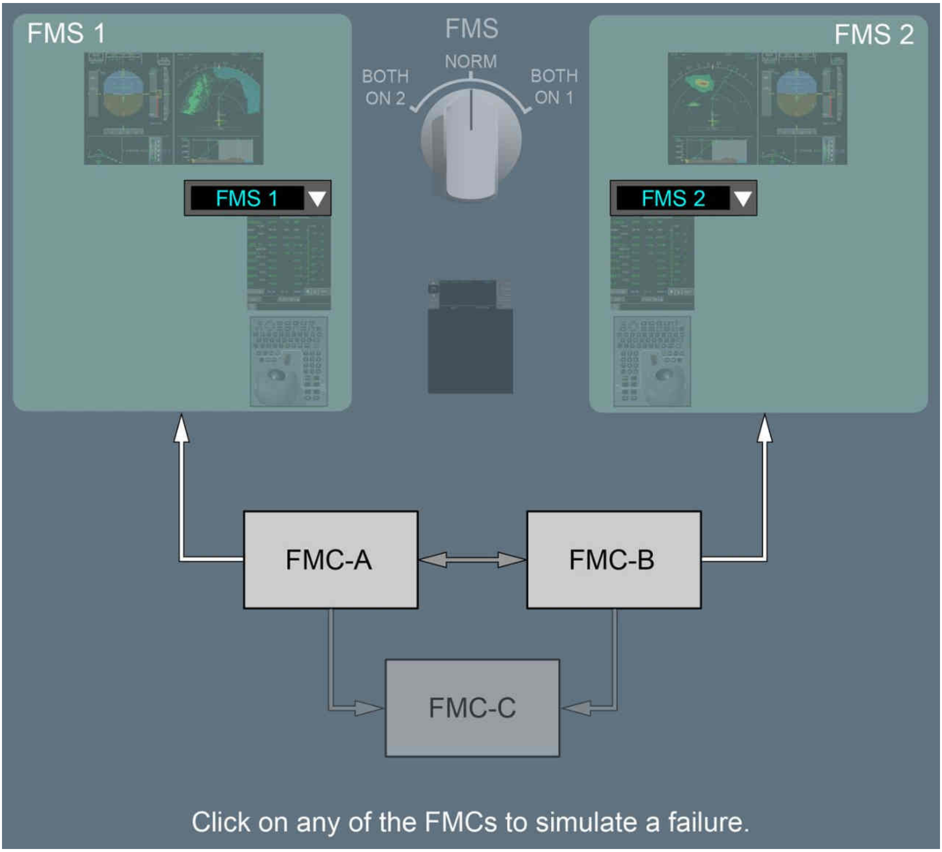
Ident.: DSC-22-FMS-40-10-00000529.0001001 / 04 SEP 14

ABNORMAL OPERATION

In abnormal operation, one (or more) of the following cases may occur:

- FMS 1 and FMS 2 no longer share data
  In this case, the two active FMCs operate in INDEPENDENT mode: *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.
- One or more FMCs fail
  On the illustration below, click on any of the FMCs to simulate a failure.

Abnormal Operation



FMS 1
FMS
NORM
BOTH ON 2
BOTH ON 1
FMS 2
FMS 1
FMS 2
FMC-A
FMC-B
FMC-C
Click on any of the FMCs to simulate a failure.

For information about:

- The failure of one FMC: *Refer to DSC-22-FMS-40 Failure of One FMC*
- The failure of two FMCs: *Refer to DSC-22-FMS-40 Failure of Two FMCs (SINGLE Mode)*
- The failure of all FMCs: *Refer to DSC-22-FMS-40 Failure of All FMCs (Backup Navigation)*.

- An automatic FMC reset occurs: *Refer to DSC-22-FMS-40 Automatic FMC Reset*
- The PRIMs reject FMC data, while the flight crew performs a RNP AR procedure: *Refer to DSC-22-FMS-40 FMC Data Not Valid during a RNP AR Procedure*.

The NDs display the Backup Trajectory (BACKUP TRAJ) if:

- The FMC abnormal operation causes the loss of the flight plan in the two active FMCs
- During a RNP AR procedure, the PRIMs reject the FMC data of the two active flight plans and request the display of the BACKUP TRAJ.

The BACKUP TRAJ is based on the FMS data that the CDS memorizes, when the abnormal operation occurs.

Note: *The BACKUP TRAJ function automatically deactivates when at least one FMC provides a valid flight plan to the CDS. During a RNP AR procedure, the BACKUP TRAJ function deactivates only if, above safety altitude, the flight crew revises the active flight plan at aircraft present position (i.e. DIR TO).*

L2 For more information about the BACKUP TRAJ, *Refer to DSC-31-CDS-40-40-90 BACKUP TRAJ*.

INDEPENDENT MODE

Ident.: DSC-22-FMS-40-00000523.0001001 / 03 AUG 16
Applicable to: ALL

In normal operation, FMS 1 and FMS 2 are in DUAL mode: The two active FMCs independently calculate data, and then share, compare, and synchronize these data.
Both FMS change from DUAL to INDEPENDENT mode, if there is a communication failure (due to an avionics network failure) between the active FMCs.
When both FMS operate in INDEPENDENT mode, the FMCs no longer share information. The FMCs therefore operate independently. If the flight crew modifies any entry on one , the flight crew must duplicate the entry on the other FMS MFD page.

Note: *If the flight crew performs an RNP AR procedure, the PRIMs consider that the data of the two active FMCs are not valid. As a result, the PRIMs reject the two active FMCs and no longer consider their data for guidance. Two rejected active FMCs does not result in the AP disengagement (if previously engaged). The PRIMs use the data of the backup FMC for the FG. No lateral mode reversion occurs but vertical guidance mode reverts in basic mode. After the exit of the RNP AR procedures, the flight crew shall pull the HDG knob on the FCU in order to interact with the MFD FMS pages.*

RNP AR

L3 At FMC power-up, the active FMCs crosscheck the specific data that must be identical in both active FMCs for normal operation in DUAL mode. If any part of this data is not identical in both active FMCs, the active FMCs change to INDEPENDENT mode.

The specific data are:
- Navigation, performance, and magnetic variation databases
- Airline Modifiable Information (AMI) file
- Aircraft type and engine type
- FM operational program
- Engine manufacturer program pins.

L1 CONTROLS AND INDICATORS

ECAM ALERTS

If the active FMCs change to INDEPENDENT mode while the flight crew performs an RNP AR procedure (i.e. with the NAV mode engaged with the AP or the FD engaged. The flight crew must engage the AP if the RNP value is strictly below 0.3 NM), the following ECAM alert is triggered: AUTO FLT FMS 1+2 REJECTED (*Refer to procedure*).

ON THE MFD AND THE ND

If the flight crew does not perform an RNP AR procedure

If the flight crew does not perform an RNP AR procedure, both MFDs display:
- The IND message in the shared message area
- The INDEPENDENT OPERATION message in the FMS message area.

L3 At FMC power-up, if the active FMCs change to INDEPENDENT mode because they do not have identical data, the FMS message area displays one or more of the following messages to indicate the data that is not identical:
- FMCs ACFT STATUS DISAGREE INDEPENDENT OPERATION (*Refer to message*)
- FMCs PIN PROG TYPE DISAGREE INDEPENDENT OPERATION (*Refer to message*).

INDEPENDENT OPERATION

L2 In addition, the POSITION pages do not display:

- On the MFD of the Captain, the position data that FMS 2 provides
- On the MFD of the First Officer, the position data that FMS 1 provides.

L1 If the flight crew performs an RNP AR procedure

If both FMS change to INDEPENDENT mode while the flight crew performs an RNP AR procedure:

- On both NDs:
  - The upper part of the ND displays the BACKUP TRAJ
  - The FMS message zone of ND displays RNP AR CAPABILITY LOST
  - The VD displays the altitude and distance scales in red.

L2 *Note: The VD of the Captain(First Officer) no longer displays the flight plan, neither weather(terrain) data.*

L1

- If the MFD displays an FMS page, the FMS page disappears, and the MFD displays the FMS PAGE NOT AVAIL message instead of the FMS page.

L3 *Note: An additional secondary MFD may appear on the outer display unit of the Captain, on the outer display unit of the First Officer, or on both sides. This display configuration occurs if the center lower DU displays the OIS, and the outer display unit display MFD. In this display configuration, on the additional secondary MFD:*

- *The FMS page disappears*
- *The ADDITIONAL FMS PAGE NOT AVAIL message appears instead of the FMS page.*

FAILURE OF ONE FMC

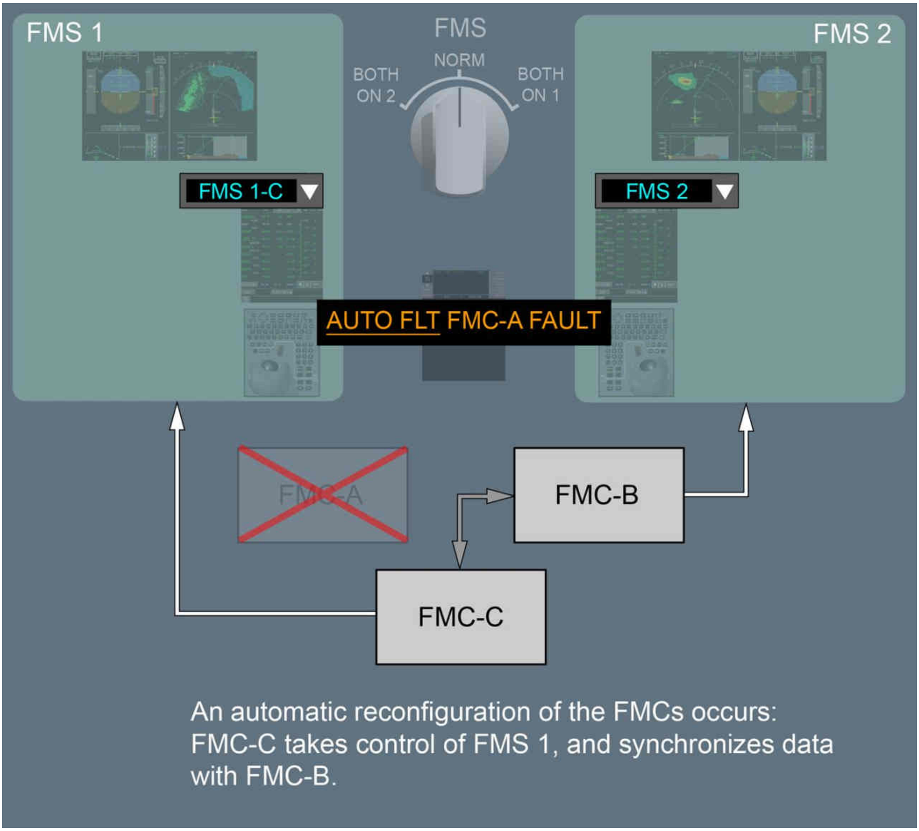
Ident.: DSC-22-FMS-40-00000524.0001001 / 04 SEP 14
Applicable to: ALL

If one of the active FMCs fails, an automatic reconfiguration of the FMCs occurs. The backup FMC takes over, and synchronizes with the active FMC that is not affected. FMS 1 and FMS 2 are still operative. However, redundancy is lost, because there is no longer a backup FMC.
If the backup FMC fails, the reconfiguration of the FMCs is not necessary. The active FMCs will continue to control FMS 1 and FMS 2, but redundancy is lost.

Note:

1. *One active FMC failure does not disengage the AP (if previously engaged) and no mode reversion occurs. When AP 1(2) is engaged, if the active FMC that fails is used for FMS 1(2), the PRIMs temporarily use the data of the opposite FMS for the Flight Guidance (FG), until the backup FMC takes control of the affected FMS.*
2. *The behavior remains the same during an RNP AR procedure.*

The following illustration provides an example (automatic reconfiguration after the failure of FMC-A).



FMS 1
FMS
NORM
BOTH ON 2
BOTH ON 1
FMS 2
FMS 1-C
FMS 2
AUTO FLT FMC-A FAULT
FMC-A
FMC-B
FMC-C

An automatic reconfiguration of the FMCs occurs: FMC-C takes control of FMS 1, and synchronizes data with FMC-B.

CONTROLS AND INDICATORS

ECAM ALERTS

In the case of an FMC failure, one of the following ECAM alerts is triggered:
- AUTO FLT FMC-A FAULT (*Refer to procedure*), if FMC-A is failed
- AUTO FLT FMC-B FAULT (*Refer to procedure*), if FMC-B is failed
- AUTO FLT FMC-C FAULT (*Refer to procedure*), if FMC-C is failed.

ON THE MFD AND THE ND

If the backup FMC (i.e. FMC-C) fails, the MFD will not indicate the FMC failure.

If FMC-A(B) fails:

- On the ND:
  - The upper part of the ND of the Captain(First Officer) no longer displays the flight plan and displays the MAP NOT AVAIL message

L2 *Note: The display on the upper part of the ND of weather(terrain) data remains operative.*

L1
  - The VD of the Captain(First Officer) displays the altitude and distance scales in red

L2 *Note: The VD of the Captain(First Officer) no longer displays the flight plan, neither weather(terrain) data.*

L1
- If the MFD of the Captain(First Officer) displays an FMS page, the FMS page disappears, and the MFD displays the FMS PAGE NOT AVAIL message instead of the FMS page.

L3 *Note: An additional secondary MFD may appear on the outer display unit of the Captain(First Officer). This display configuration occurs if the center lower display unit displays the OIS, and the outer display unit displays two MFDs. In this display configuration, on the additional secondary MFD:*
  - *The FMS page disappears*
  - *The ADDITIONAL FMS PAGE NOT AVAIL message appears instead of the FMS page.*

L1 As soon as the backup FMC (i.e. FMC-C) takes over, the MFD displays:

- FMS 1-C(FMS 2-C) in the MFD system menu, to indicate that FMC-C will provide data to FMS 1(2)
- The DATA/STATUS page (before engine start), or the ACTIVE/F-PLN page (after engine start)
- The PLEASE WAIT FOR FMS RESYNCH message in the FMS message area.
  When the backup FMC becomes operative, the PLEASE WAIT FOR FMS RESYNCH message disappears from the FMS message area.

FAILURE OF TWO FMCS (SINGLE MODE)

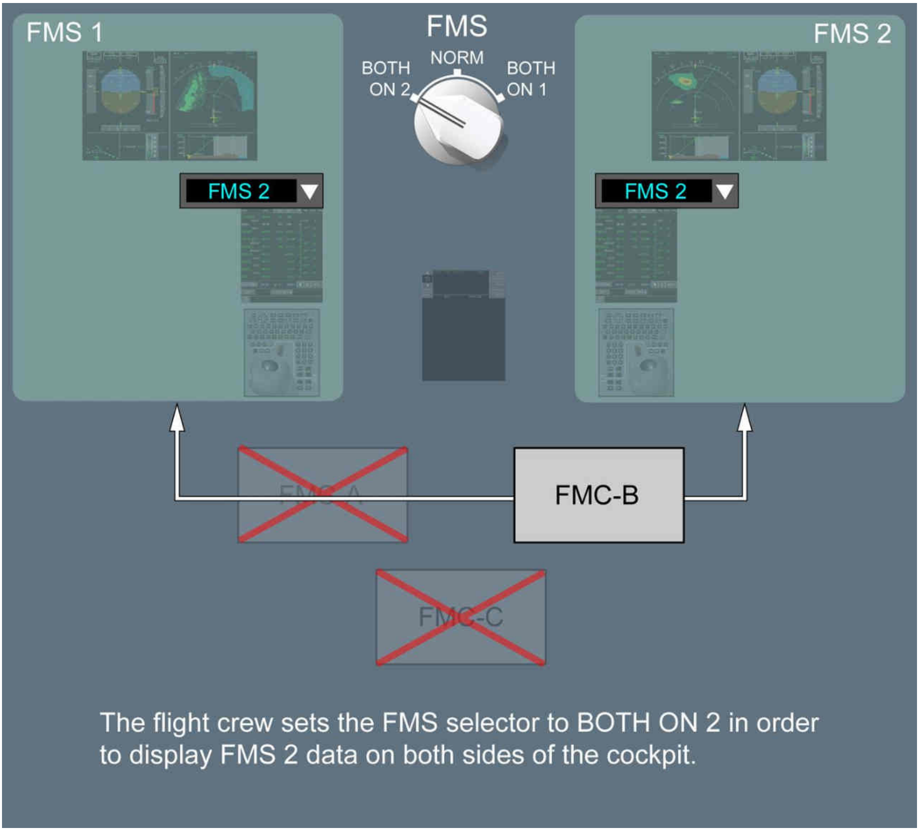
Ident.: DSC-22-FMS-40-00000525.0001001 / 02 OCT 14
Applicable to: ALL

If two FMCs fail, one entire FMS side (FMS 1 or FMS 2) is failed. The remaining FMS operates in SINGLE mode.

The flight crew uses the FMS selector as follows:
- If FMS 1 is failed, the flight crew sets the FMS selector to BOTH ON 2, in order to display FMS 2 data on both sides of the cockpit
- If FMS 2 is failed, the flight crew sets the FMS selector to BOTH ON 1, in order to display FMS 1 data on both sides of the cockpit.

Note: *1. One FMS failure does not result in the AP disengagement (if previously engaged) and no mode reversion occurs. When AP 1(2) is engaged, if FMS 1(2) fails, the PRIMs temporarily use the data from FMS 2(1) for Flight Guidance (FG), until the flight crew sets the FMS selector to BOTH ON 2(1).*
2. The behavior remains the same during an RNP AR procedure.

The following illustration provides an example (manual reconfiguration after the failure of FMC-A and FMC-C).



The flight crew sets the FMS selector to BOTH ON 2 in order to display FMS 2 data on both sides of the cockpit.

CONTROLS AND INDICATORS

ECAM ALERTS

In the case of a dual FMC failure, one of the following ECAM alerts is triggered:

- AUTO FLT FMS 1 FAULT (*Refer to procedure*), if FMS 1 is failed
- AUTO FLT FMS 2 FAULT (*Refer to procedure*), if FMS 2 is failed.

Note: *After the flight crew clears the procedure, the WD displays the FMS SWTG memo to indicate that the FMS selector is set to BOTH ON 2 or BOTH ON 1.*

ON THE MFD AND THE ND

If FMS 1(2) fails:

- On the ND:
  - The upper part of the ND of the Captain(First Officer) no longer displays the flight plan and displays the MAP NOT AVAIL message

    L3 If the two active FMCs fail, and the time between the two failures is too short for the backup FMC to synchronize the data, all FMS data is lost. As a result, the BACKUP TRAJ appears on the upper part of both NDs. The flight crew must initialize the FMS again.

    L2 *Note:* *1. The display of weather(terrain) data on the upper part of the ND remains operative.*
    2. If the failure causes the loss of the flight plan in the remaining FMCs, the MAP NOT AVAIL message does not appear. The upper part of both NDs displays the BACKUP TRAJ. For more information, Refer to DSC-31-CDS-40-40-90 BACKUP TRAJ.

  - L1 The VD of the Captain(First Officer) displays the altitude and distance scales in red

    L2 *Note:* *The VD of the Captain(First Officer) no longer displays the flight plan, neither weather(terrain) data.*

- L1 If the MFD of the Captain(First Officer) displays an FMS page, the FMS page disappears, and the MFD displays the FMS PAGE NOT AVAIL message instead of the FMS page.

  L3 *Note:* *An additional secondary MFD may appear on the outer display unit of the Captain(First Officer). This display configuration occurs if the center lower display unit displays the OIS, and the outer display unit displays two MFDs. In this display configuration, on the additional secondary MFD:*
  - *The FMS page disappears*
  - *The ADDITIONAL FMS PAGE NOT AVAIL message appears instead of the FMS page.*

L1 After the flight crew sets the FMS selector to BOTH ON 2(1):

- The MFD of the Captain(First Officer) displays the ACTIVE/F-PLN page
  The MFD system menu displays the same label as on the MFD of the First Officer(Captain). The fact that both MFD system menus display the same label indicates that both sides of the cockpit display data that comes from the same FMC.
- The ND of the Captain(First Officer) displays the OFFSIDE FM CONTROL message
  This message indicates that the active FMC on the side of the First Officer(Captain) provides the FMS data for the side of the Captain(First Officer).

- The PFD of the Captain(First Officer) displays the same RNP AR lateral and vertical deviations as on the PFD of the First Officer(Captain).
- On the EFIS CP of the Captain(First Officer), the flight crew can no longer select:
  - The FMS display options: CSTR, WPT, VORD, NDB, and ARPT
  - The ND mode (except the ROSE-VOR and ROSE-LS modes)
  - The ND range (except the ZOOM position).

  The flight crew manages these display options via the EFIS CP of the First Officer(Captain).

L2 *Note: The ND and VD displays of weather(terrain) data remain operative.*

FAILURE OF ALL FMCS (BACKUP NAVIGATION)

Ident.: DSC-22-FMS-40-00000526.0002001 / 14 APR 16
Applicable to: ALL

If all FMCs fail, all FMS data and functions are lost on both sides (FMS 1 and FMS 2). However, the ND still displays a trajectory. This trajectory is the BACKUP TRAJ.

L2 For more information about the BACKUP TRAJ, *Refer to DSC-31-CDS-40-40-90 BACKUP TRAJ*.

L1 The flight crew must tune the navaids via the STBY RAD NAV mode of the RMP.

L2 For more information about the STBY RAD NAV mode of the RMP, *Refer to DSC-34-NAV-70-30 How to Tune the Navaids in STBY RAD NAV*.

L1 *Note:*
1. *The failure of all FMCs does not disengage the AP (if previously engaged), but the lateral and vertical guidance modes revert in basic mode.*
2. *The behavior remains the same during an RNP AR procedure.*

If necessary, the flight crew can create a basic flight plan via the SND ◁✻ .

L2 For more information about the SND, *Refer to DSC-34-NAV-30-10 Overview*.

The flight crew can create a basic flight plan via the ISIS.

L1 CONTROLS AND INDICATORS

ECAM ALERTS

If all FMCs fail, the following ECAM alert is triggered: AUTO FLT FMS 1+2 FAULT (*Refer to procedure*).

ON THE MFD AND THE ND

If all FMCs fail:
- On both NDs:
  - The upper part of the ND displays the BACKUP TRAJ
  - The VD displays the altitude and distance scales in red

L2 *Note: The VD of the Captain(First Officer) no longer displays the flight plan, neither weather(terrain) data.*

L1
- If the MFD displays an FMS page, the FMS page disappears, and the MFD displays the FMS PAGE NOT AVAIL message instead of the FMS page.

L3 *Note: An additional secondary MFD may appear on the outer display unit of the Captain, on the outer display unit of the First Officer, or on both sides. This display configuration occurs if the center lower DU displays the OIS, and the outer display unit display MFD. In this display configuration, on the additional secondary MFD:*
- *The FMS page disappears*
- *The ADDITIONAL FMS PAGE NOT AVAIL message appears instead of the FMS page.*

FMC RESET AND RESYNCHRONIZATION

Applicable to: ALL

Ident.: DSC-22-FMS-40-20-00000527.0001001 / 04 SEP 14

AUTOMATIC FMC RESET

If the FMC software does not work correctly, or receives instructions to perform operations that are not possible, the FMC automatically resets.

MINOR RESET

In the case of a **minor** reset, the FMC recovers all of the FMS data.
After the data is recovered, the FMC resynchronizes with the other active FMC, in order to restore the DUAL mode of operation.

MAJOR RESET

When three resets occur at short intervals, the FMC loses all of the FMS data. This type of reset is referred to as a **major** reset. To recover the FMS data, the FMC resynchronizes with the active FMC, if there is one.

LATCH

When four resets occur at short intervals, the FMC automatically latches its state, and the AUTO FLT FMC-A(B)(C) FAULT alert is triggered. The backup FMC, if available, takes over.

Ident.: DSC-22-FMS-40-20-00000530.0001001 / 04 SEP 14

AUTOMATIC FMC RESYNCHRONIZATION

After a reset, the FMC resynchronizes with the active FMC, in order to recover all of the FMS data, and to restore the DUAL mode of operation.
If several resynchronizations occur and fail, at short intervals, the active FMCs automatically change to INDEPENDENT mode.

Ident.: DSC-22-FMS-40-20-00000531.0001001 / 04 DEC 14

MANUAL FMC RESET

In some cases, it may be necessary to manually reset the FMCs.
The flight crew should reset only one FMC at a time.
In order to manually reset FMC-A(B)(C), the flight crew uses the FMC-A(B)(C) reset button that is on the overhead panel.

FMC MALFUNCTION

If the flight crew detects an FMC malfunction (with or without the associated AUTO FLT FMC-A(B)(C) FAULT alert), the flight crew can attempt to restore the FMS functions by a reset of the affected FMC.
For information on how to manually reset an FMC in the case of an FMC malfunction, *Refer to PRO-ABN-ABN-RESET AUTO FLT FMC-A(B)(C) Reset*.

ABNORMAL CONFIGURATION OF THE FMCs

Before engine start, if all FMCs are operative, the three FMCs automatically ensure the normal operation configuration. The normal configuration is the following configuration:

- FMC-A is assigned to FMS 1
- FMC-B is assigned to FMS 2
- FMC-C is the backup FMC.

After engine start, the flight crew may detect that the three FMCs are operative, but in an abnormal configuration (e.g. FMC-C is assigned to FMS 1, and FMC-A is the backup FMC).

Note: *In the case of an abnormal configuration, the PRIMs downgrade the RNP AR capability.*

The flight crew can restore the normal operation configuration by a reset of one of the FMCs that is not in the correct configuration.
Example: FMC-C is assigned to FMS 1, FMC-B is assigned to FMS 2, and FMC-A is the backup FMC. All three FMCs are operative. When the flight crew resets FMC-C, FMC-A takes control of FMS 1, and FMC-C becomes the backup FMC again.
For information on how to manually reset an FMC in the case of an abnormal configuration of the FMCs, *Refer to PRO-ABN-ABN-RESET AUTO FLT FMC-A(B)(C) Reset*.

PLEASE WAIT FOR FMS RESYNCH

After FMC resynchronization, the MFD displays:

- Before engine start, the DATA/STATUS page
- After engine start, the ACTIVE/F-PLN page.

- The automatic tuning of the navaids is lost on the affected side.
  After FMC resynchronization, the automatic tuning is recovered.

- One reset of an active FMC does not disengage AP (if previously engaged) and no mode reversion occurs. When AP 1(2) is engaged, if the active FMC that resets is the FMC that is used for FMS 1(2), the PRIMs temporarily use the data of FMS 2(1) for FG, until the recovery of the affected FMC.
- If the flight crew performs an RNP AR procedure, no resynchronization occurs after an FMC reset. The PRIMs reject the affected FMC. For more information, *Refer to DSC-22-FMS-40 FMC Data Not Valid during a RNP AR Procedure*.

FMC DATA NOT VALID DURING A RNP AR PROCEDURE

Ident.: DSC-22-FMS-40-00000533.0001001 / 02 OCT 14
Applicable to: ALL

While the aircraft performs a RNP AR procedure (i.e. with the NAV mode engaged and with the AP or the FD engaged), the PRIMs reject a FMC in two cases:

- The PRIMs detect a FMC reset, and the PRIMs reject this FMC
- The PRIMs cross check the data that the three FMCs provide. If the PRIMs consider that the data of a FMC is not valid, the PRIMs reject this FMC

As a result, the PRIMs no longer use the rejected FMC for the Flight Guidance (FG).
If the PRIMs reject the backup FMC, redundancy is lost, and RNP AR capability is downgraded.

If the PRIMs reject one active FMC, the affected FMS is inoperative. The PRIMs use the active FMC that is operative, and the backup FMC. RNP AR capability is downgraded. The flight crew uses the FMS selector as follows:

- If the PRIMs reject the FMC that controls FMS 1, the flight crew sets the FMS selector to BOTH ON 2 in order to display FMS 2 data on both sides of the cockpit
- If the PRIMs reject the FMC that controls FMS 2, the flight crew sets the FMS selector to BOTH ON 1 in order to display FMS 1 data on both sides of the cockpit.

Note: *One rejected active FMC does not disengage AP (if previously engaged) and no mode reversion occurs. When AP 1(2) is engaged, if the active FMC that is rejected is the FMC that is used for FMS 1(2), the flight crew shall select AP 2(1).*

If the PRIMs reject the two active FMCs, both FMS are inoperative. The PRIMs use the backup FMC only. RNP AR capability is lost.

Note: *Two rejected active FMCs do not disengage AP (if previously engaged). The PRIMs use the data of the backup FMC for the FG. No lateral mode reversion occurs but vertical guidance mode reverts in basic mode. The flight crew cannot interact anymore with MFD FMS pages until exiting the RNP AR procedures by pulling HDG knob on FCU.*

CONTROLS AND INDICATORS

ECAM ALERTS

If the PRIMs reject FMC data, one of the following ECAM alerts is triggered:

- AUTO FLT FMS BKUP REJECTED (*Refer to procedure*), if the PRIMs reject the backup FMC
- AUTO FLT FMS 1 REJECTED (*Refer to procedure*), if the PRIMs reject the active FMC that controls FMS 1

L2 *Note: After the flight crew clears the procedure, the WD displays the FMS SWTG memo to indicate that the FMS selector is set to BOTH ON 2.*

L1
- AUTO FLT FMS 2 REJECTED (*Refer to procedure*), if the PRIMs reject the active FMC that controls FMS 2

L2 *Note: After the flight crew clears the procedure, the WD displays the FMS SWTG memo to indicate that the FMS selector is set to BOTH ON 1.*

L1
- AUTO FLT FMS 1+2 REJECTED (*Refer to procedure*), if the PRIMs reject the two active FMCs.

ON THE MFD, THE PFD AND THE ND

If the PRIMs reject the backup FMC

If the PRIMs reject the backup FMC, the MFD and the ND do not display specific indications.

If the PRIMs reject one active FMC

If the PRIMs reject the FMC that controls FMS 1(2):

- On the ND:
  - The upper part of the ND of the Captain(First Officer) displays the MAP NOT AVAIL message instead of the flight plan.

L2 *Note:* *The display of weather(terrain) data on the upper part of the ND remains operative.*

L1
  - The VD of the Captain(First Officer) displays the altitude and distance scales in red

L2 *Note:* *The VD of the Captain(First Officer) no longer displays the flight plan, neither weather(terrain) data.*

L3 *Note:* *If the VD displays the FMS dialog box:*
  - *The FMS dialog box disappears*
  - *The FMS PAGE NOT AVAIL message appears instead of the FMS dialog box.*

L1
- If the MFD of the Captain(First Officer) displays an FMS page, the FMS page disappears, and the MFD displays the FMS PAGE NOT AVAIL message instead of the FMS page.

L3 *Note:* *An additional secondary MFD may appear on the outer display unit of the Captain(First Officer). This display configuration occurs if the center lower display unit displays the OIS, and the outer display unit displays two MFDs. In this display configuration, on the additional secondary MFD:*
  - *The FMS page disappears*
  - *The ADDITIONAL FMS PAGE NOT AVAIL message appears instead of the FMS page.*

L1
- On the PFD of the Captain(First Officer) , the lateral and vertical RNP AR deviation scales and the RNP AR title disappear.

After the flight crew sets the FMS selector to BOTH ON 2(1):

- The MFD of the Captain(First Officer) displays the ACTIVE/F-PLN page
  The MFD system menu displays the same label as on the MFD of the First Officer(Captain). The fact that both MFD system menus display the same label indicates that both sides of the cockpit display data that comes from the same FMC.
- The ND of the Captain(First Officer) displays the OFFSIDE FM CONTROL message
  This message indicates that the active FMC on the side of the First Officer(Captain) provides the FMS data for the side of the Captain(First Officer).

- The PFD of the Captain(First Officer) displays the same RNP AR lateral and vertical deviations as on the PFD of the First Officer(Captain).
- On the EFIS CP of the Captain(First Officer), the flight crew can no longer select:
  - The FMS display options: CSTR, WPT, VORD, NDB, and ARPT
  - The ND mode (except the ROSE-VOR and ROSE-LS modes)
  - The ND range (except the ZOOM position).

  The flight crew manages these display options via the EFIS CP of the First Officer(Captain).

L2 *Note: The ND and VD displays of weather(terrain) data remain operative.*

L1 If the PRIMs reject the data of the two active FMCs

If the PRIMs reject the two active FMCs:

- On both NDs:
  - The upper part of the ND displays the BACKUP TRAJ (refer to *Refer to DSC-31-CDS-40-40-90 BACKUP TRAJ*)
  - The upper part of the ND displays the RNP AR CAPABILITY LOST message
  - The VD displays the altitude and distance scales in red

L3 *Note: If the ND displays the FMS dialog box instead of the VD:*
  - *The FMS dialog box disappears*
  - *The FMS PAGE NOT AVAIL message appears instead of the FMS dialog box.*

L1
- On both PFDs, the RNP AR vertical deviation disappears.

  Note: On both PFDs, the RNP AR lateral deviation remains, based on the backup FMC computation.
- If the MFD displays an FMS page, the FMS page disappears, and the MFD displays the FMS PAGE NOT AVAIL message instead of the FMS page.

L3 *Note: An additional secondary MFD may appear on the outer display unit of the Captain, on the outer display unit of the First Officer, or on both sides. This display configuration occurs if the center lower DU displays the OIS, and the outer display unit display MFD. In this display configuration, on the additional secondary MFD:*
  - *The FMS page disappears*
  - *The ADDITIONAL FMS PAGE NOT AVAIL message appears instead of the FMS page.*

DISPLAY OF ERRONEOUS FIX INFO ON THE ND

Ident.: DSC-22-FMS-40-00025376.0001001 / 03 JUL 20
Applicable to: ALL

1 DESCRIPTION

The FIX INFO revision allows the flight crew:
- To create a waypoint at the intersection of the F-PLN and the FIX INFO (radial, circle (radius) or abeam)
- To display the FIX INFO (radial, circle (radius) or abeam) on the ND.

For more information on the FIX INFO, *Refer to FIX INFO*.
When the ND displays a FIX INFO (dotted blue line or dotted blue circle), this FIX INFO may not appear correctly. This is particularly visible for FIX INFO RADIUS with a large radius (more than 300 NM).
The flight crew must not base any decision making on the display of the FIX INFO on the ND. For example, the use of the FIX INFO circle (radius) function is not recommended to display ETOPS operating area on the ND, as it may not show appropriate information relative to the current aircraft position or the planned trajectory.

The following information are correct and the flight crew can use them:
- On the ND, the waypoint created at the intersection of the FIX INFO and the F-PLN is correct.
- On the MFD, the information on the FIX INFO page are correct:
  - The time of arrival at the intersection waypoint
  - The distance to the intersection waypoint
  - The predicted altitude at the intersection waypoint.

Intentionally left blank

ERRONEOUS TRAJECTORY WHILE IN HDG(TRK) MODE DURING PROCEDURES WITH A TURN DIRECTION ON A LEG WITH AN ALTITUDE TERMINATION

Ident.: DSC-22-FMS-45-00023833.0001001 / 01 SEP 16
Applicable to: ALL

In some very specific operational conditions that depend on the coding in the Navigation Database of the procedure, and on various performance conditions (aircraft weight, flaps, thrust setting, temperature, wind ...), the FMS may compute an erroneous trajectory.

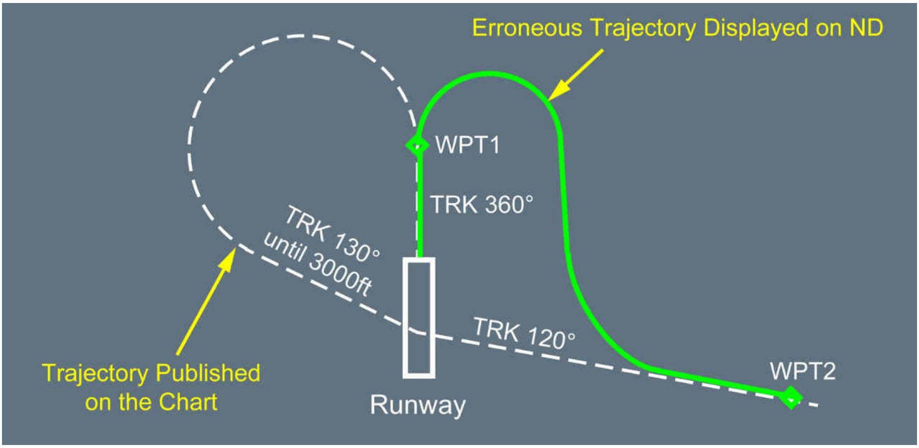
The SIDs and the Missed Approach procedures that may be affected are coded in the Navigation Database with a leg that has a turn direction and an altitude termination. The leg can be one of the following:
- A Course-to-an-Altitude (CA) leg that defines a course to follow to an altitude
- A Fix-to-an-Altitude (FA) leg that defines a track to follow from a waypoint to an altitude
- A Heading-to-an-Altitude (VA) leg that defines a heading to follow to an altitude
- A Holding-to-an-Altitude (HA) leg that defines a holding pattern to an altitude.

The turn direction (left or right) that is coded on a leg indicates that the aircraft has to execute a turn in the specified direction to intercept the leg.
In some very specific operational conditions, the FMS may predict that the aircraft will reach the altitude that terminates the leg, before the initiation of the leg. In that case, the FMS ignores the leg and the associated turn direction.
The FMS computes a new trajectory to directly join the next leg. The trajectory may not be consistent with the published trajectory.
The abnormal behavior depends on the AP/FD lateral modes engaged.

After takeoff, the NAV mode engages. At any time before the end of the altitude termination leg:
- If the NAV mode stays engaged, the FMS will compute a trajectory consistent with the published trajectory
- If the HDG/TRK mode is engaged, the FMS may compute an erroneous trajectory and display it on the ND. If the flight crew engages the NAV mode, the aircraft will follow the erroneous trajectory.

Example:
- Leg 1: A Course-to-Fix (CF) leg that defines a track (360 °) to a waypoint (WPT1)
- Leg 2: A Course-to-an-Altitude (CA) leg that defines a track (130 °) to intercept an altitude (3 000 ft). The leg is coded in the Navigation Database with a turn direction (left). The end of the leg depends on the aircraft performance. The turn direction is indicated by an arrow on the line of leg 1 on the F-PLN page of the MFD.
- Leg 3: A CF leg that defines a track (120 °) to a waypoint (WPT2).

Erroneous trajectory on ND



Depending on the aircraft performance, the FMS may predict that the aircraft will reach 3 000 ft before WPT1. In that case, if the HDG/TRK mode is engaged, the FMS ignores the leg 2 (CA leg) because the aircraft is already above the altitude that ends leg 2, before the beginning of leg 2. The FMS also ignores the turn direction that is coded on the leg.
As a result, the FMS computes again the trajectory from the end of leg 1, directly to leg 3. As shown on the above illustration, this trajectory includes a right turn, instead of a left turn, because it induces the shortest course change to intercept leg 3 (CF leg). This erroneous trajectory will be displayed on the ND.
If flight crew reengages the NAV mode before the end of the altitude termination leg, the aircraft follows this erroneous trajectory.

OPERATIONAL RECOMMENDATIONS

The flight crew should pay particular attention to the check of the flight plan during the Cockpit Preparation, and during the Descent Preparation.

CAUTION	Even if the flight plan is correct during the Cockpit Preparation or during the Descent Preparation, the FMS may compute and display an erroneous trajectory when the FMS updates its predictions after takeoff or after go-around initiation.

When in HDG/TRK mode after takeoff or go around initiation, if the flight crew detects that the lateral flight plan does not agree with the published trajectory, the flight crew should keep the HDG/TRK mode engaged, and monitor NAVAID raw data as appropriate.

The flight crew should only reengage the NAV mode when the lateral flight plan is consistent with the published trajectory.

ERRONEOUS ALTITUDE CONSTRAINT AFTER SID OR STAR SELECTION CHANGE

Ident.: DSC-22-FMS-45-00023660.0001001 / 07 JUL 16
Applicable to: ALL

DESCRIPTION

When the flight crew changes the SID or the STAR procedure, the FMS may keep a constraint of the previous procedure after the change.
The condition of occurrence is that both SID(STAR) procedures have the same last(first) waypoint but with different associated altitude constraints.
At the first SID(STAR) selection, the waypoint is linked to the en-route flight plan and the FMS considers this waypoint as the first(last) en-route waypoint.
When the SID(STAR) is changed, the FMS may keep the constraint of the first(last) en-route waypoint rather than the constraint of the new selected SID(STAR).

Note: *The issue may also appear if the altitude constraint was inserted manually in the previous SID(STAR).*

PROCEDURE

As per SOP, the flight crew must compare the inserted SID(STAR), including constraints, with the charts and make corrections if necessary.

ERRONEOUS FUEL & LOAD VALUES FOLLOWING RECEIVED CPNY F-PLN

Ident.: DSC-22-FMS-45-00023924.0001001 / 08 NOV 18
Applicable to: ALL

DESCRIPTION

In SEC 1(2)(3) on the SEC INDEX page, if the flight crew presses the IMPORT/ACTIVE button when a CPNY F-PLN is received, the FMS creates a link between the SEC 1(2)(3) F-PLN and the ACTIVE F-PLN. This action can be due to an inadvertent selection of the IMPORT/ACTIVE button instead of the RECEIVED CPNY F-PLN button.
This link has no impact on the current flight preparation: if the flight crew presses the RECEIVED CPNY F-PLN button, the FMS correctly inserts the CPNY F-PLN in the SEC 1(2)(3) F-PLN.
However, this link is erroneously active for the next flight. When the flight crew creates a new SEC 1(2)(3) F-PLN (received by ACARS or not), the fuel and load data stored during the FMS DONE phase of the previous flight are inserted in this SEC 1(2)(3) F-PLN. Then, when the flight crew swaps the ACTIVE F-PLN with this SEC 1(2)(3) F-PLN, the FMS inserts these fuel and load data in the ACTIVE F-PLN.

These erroneous data may affect the automatic fuel distribution and the fuel order in case of refuel process in progress.

PROCEDURE

HOW TO AVOID THIS ERRONEOUS INSERTION OF DATA?

If a CPNY F-PLN is received via ACARS, the flight crew inserts the F-PLN on the ACTIVE F-PLN only.

L2 Because there is no IMPORT button on the ACTIVE/INIT page, there is no risk of inadvertently pressing the IMPORT/ACTIVE button.

L1 Then the flight crew imports the ACTIVE F-PLN in the SEC 1(2)(3).

HOW TO MANAGE THE ERRONEOUS INSERTION OF DATA IN THE ACTIVE F-PLN?

The flight crew must overwrite the erroneous data values:

- Flight number
- Cruise flight level and temperature
- Tropopause altitude
- Cost Index (CI)
- ZFW, ZFWCG, Minimum fuel at destination, and BLOCK fuel
- Route reserve and final fuel (time) data
- Passenger number.

Note: *These data are inserted during the MFD FMS Preparation part of the Cockpit Preparation SOP (Refer to PRO-NOR-SOP-60 MFD FMS Preparation - Flight Plan Initialization).*

ERRONEOUS VERTICAL GUIDANCE IN APPROACH SUBSEQUENT TO A DIR TO PERFORMED WHEN NEAR THE TOP OF DESCENT

Ident.: DSC-22-FMS-45-00024988.0001001 / 08 JUL 19
Applicable to: ALL

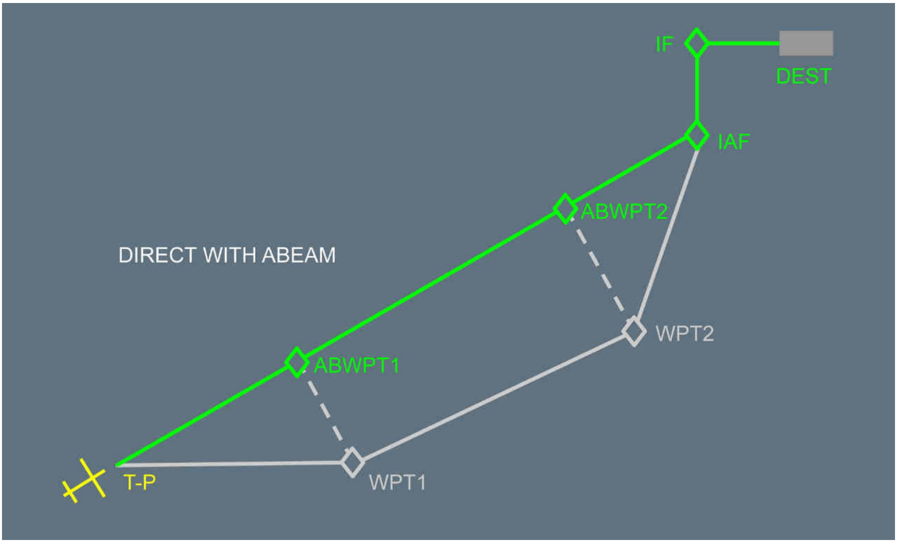
DESCRIPTION

When the flight crew inserts a DIR TO waypoint, the FMS computes the horizontal path to the destination. When near the top of descent, if the flight crew inserts a DIR TO waypoint that is at, or after the IAF, the FMS computation may be erroneous for all of the following:
- The distance of the legs after the DIR TO waypoint
- The vertical deviation on the legs after the DIR TO waypoint
- The vertical guidance in DES or APP DES mode.

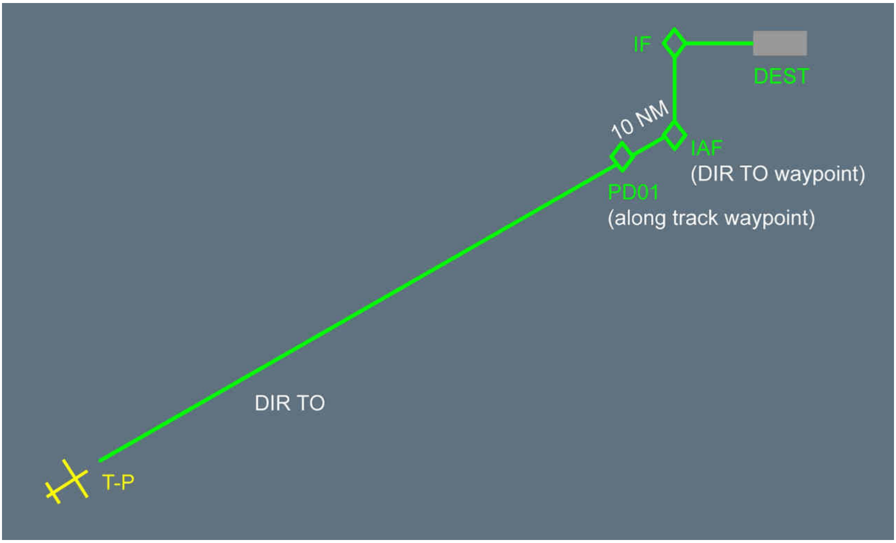
In order to compute the turn radius of the horizontal path, the FMS uses the current TAS at the time of the DIR TO insertion. This is the cause to the erroneous calculation. Instead, the FMS should use the TAS that is predicted at the DIR TO waypoint.

PROCEDURE

When near the top of descent, to insert a DIR TO waypoint that is at or after the IAF, the flight crew should use the DIRECT WITH ABEAM function. The flight crew must then check that at least one abeam waypoint is computed ahead of the position of the aircraft.
For more information on the DIRECT WITH ABEAM function, *Refer to DSC-22-FMS-10-40-20 Purpose*.



If there is no abeam waypoint computed, the flight crew must insert a place/distance waypoint 10 NM before the DIR TO waypoint. For more information, *Refer to DSC-22-FMS-20-20-20 DATA/WAYPOINT Page*



FMC RESET DUE TO F-PLN CONTENT WITH TWO SUCCESSIVE WAYPOINTS DISTANT FROM LESS THAN 2 NM

Ident.: DSC-22-FMS-45-00025375.0001001 / 03 JUL 20
Applicable to: ALL

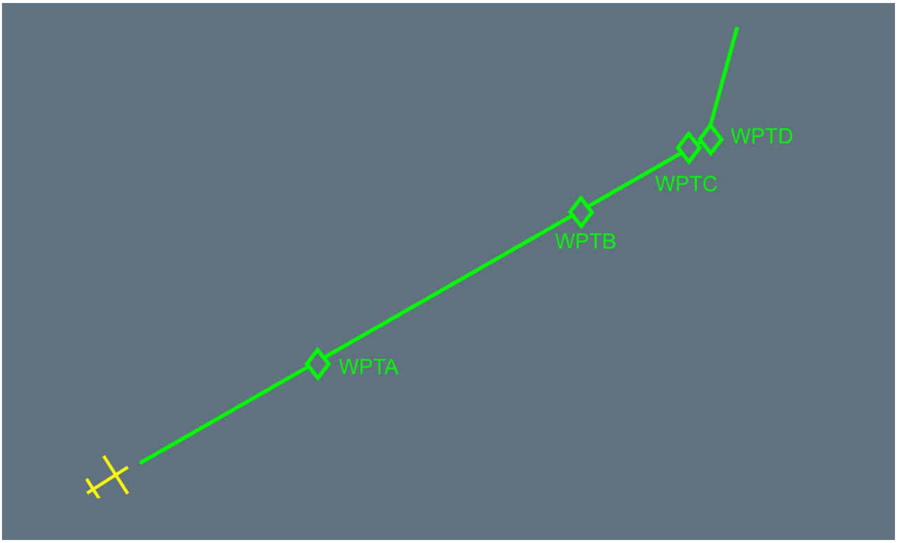
DESCRIPTION

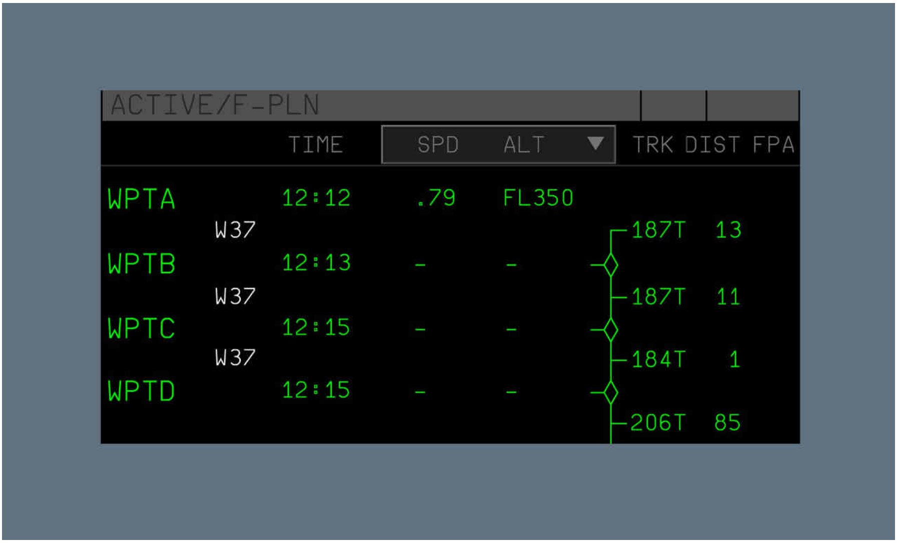
The reset occurs on the ground or in flight, upon F-PLN initialization or revisions, if either ACTIVE or SEC F-PLN has two successive waypoints with this specific configuration:

- The aircraft predicted speed for the two successive waypoints is above 250 kt
- The distance between the two successive waypoints is less than 2 NM
- The course change is above or equal to 3 °.

Note: *The waypoints could belong to the navigation database, the waypoints could be created by the pilot or the waypoints could be uplinked from the company ground station.*

The illustrations below are an example of an issue that the flight crew should identify and clean:





```
ACTIVE/F-PLN
                 TIME     SPD    ALT  ▼   TRK  DIST FPA
WPTA             12:12    .79    FL350
          W37                              187T   13
WPTB             12:13     -      -
          W37                              187T   11
WPTC             12:15     -      -
          W37                              184T    1
WPTD             12:15     -      -
                                           206T   85
```

Due to the specific configuration of these two waypoints, the transition of the path between WPT C and WPT D is very short. For each waypoint, the FMS builds this transition with several segments

from the previous leg to the next leg. The FMS continuously starts to build the transition, but never succeed. This causes to the reset.
The reset is repeated as long as the conditions mentioned above are present in one of the F-PLN.

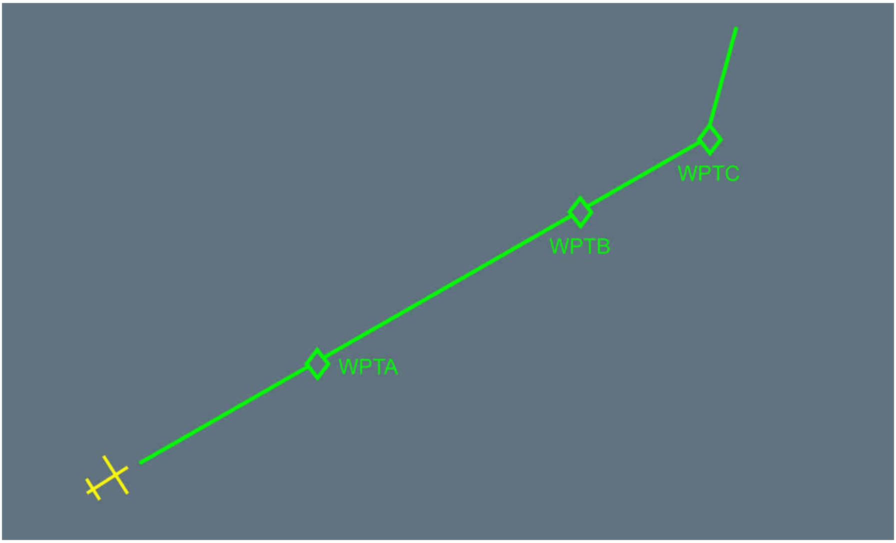
1 OPERATIONAL RECOMMENDATIONS

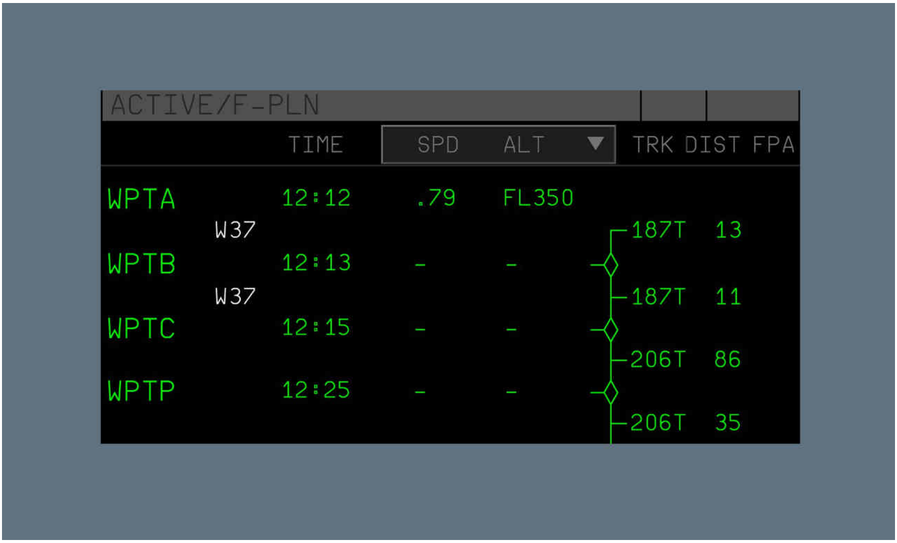
Check in the ACTIVE F-PLN and SEC F-PLN the presence of waypoints with a predicted speed above 250 kt.
If this condition is true, the flight crew must check:

1. If the distance between two successive waypoints is less than 2 NM, and
2. If the course change between these two successive waypoints is above or equal to 3 °.

If all the above conditions are met, the flight crew must:
- Not store any F-PLN that contains this configuration in a SEC F-PLN (else the reset will occur)
- Delete one of the two successive waypoints from the F-PLN.

The following illustrations show the result after the correction:





```
ACTIVE/F-PLN
                 TIME      SPD    ALT ▼     TRK  DIST FPA
WPTA             12:12     .79    FL350
           W37                             187T   13
WPTB             12:13      -      -
           W37                             187T   11
WPTC             12:15      -      -
                                           206T   86
WPTP             12:25      -      -
                                           206T   35
```

INTRODUCTION

Ident.: DSC-23-10-10-00000477.0001001 / 07 JUL 16
Applicable to: ALL

The communication system enables:

- Internal communication between the:
  - Flight crew and additional cockpit occupant(s)
  - Cabin crew
  - Ground crew
  - Passengers (i.e. for flight or cabin crew announcements)

  Internal communication is possible via the flight, cabin, and service interphones, and via the Passenger Address (PA).
- External communication via radiocommunication (HF or VHF) or Satellite Communication (SATCOM), either in voice mode or data mode.

L2 HF data mode ◁ is optional.

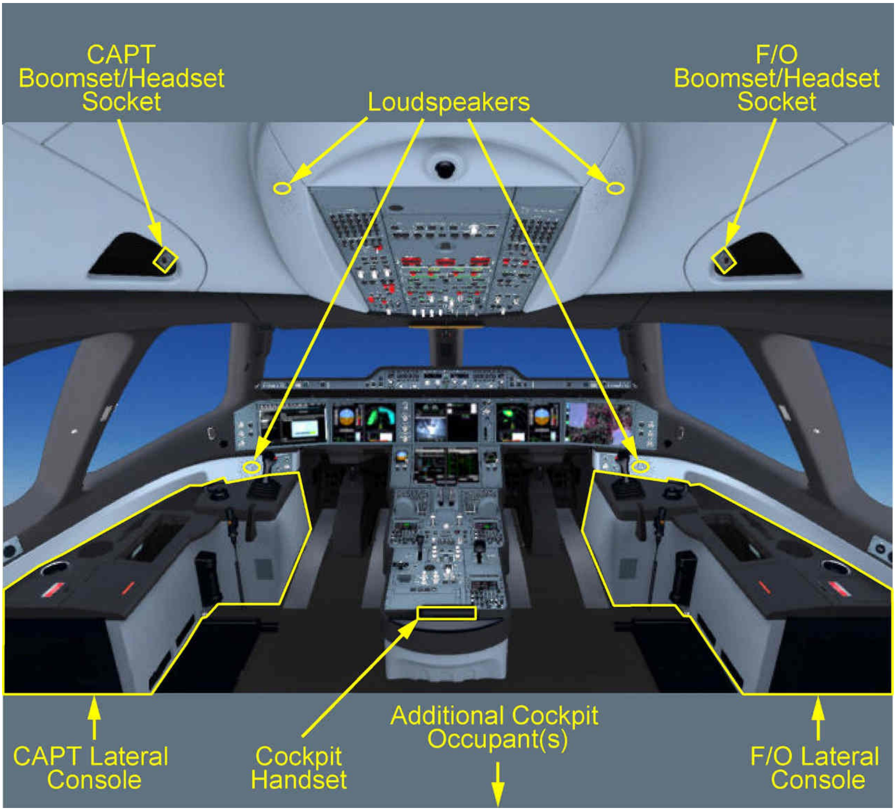
COMMUNICATION EQUIPMENT

Communication Equipment Cockpit View



CAPT Boomset/Headset Socket
Loudspeakers
F/O Boomset/Headset Socket
CAPT Lateral Console
Cockpit Handset
Additional Cockpit Occupant(s)
F/O Lateral Console

The cockpit has the following equipment:

- Four loudspeakers

L2 The two loudspeakers on the left are for communication broadcasts that the Captain selects on the RMP.

The two loudspeakers on the right are for communication broadcasts that the First Officer selects on the RMP.

L1
- One Push-To-Talk switch (PTT sw) on each sidestick
- Two glareshield PTT pb
- Three boomsets/headsets

- Three hand microphones, each with a PTT sw

L3 Communication via the hand microphone takes priority over communication via the boomset or via the oxygen mask microphone.

L1
- One microphone on the oxygen mask of the Captain (CAPT), First Officer (FO) and third occupant
- One cockpit handset.

Ident.: DSC-23-10-10-10-00000114.0001001 / 03 JUL 20

1 RADIO MANAGEMENT PANEL (RMP)

There are three Radio Management Panels (RMPs) in the cockpit. The flight crew uses these RMPs to control the communication system.

On each RMP, the flight crew can:
- Select the communication mean(s) in transmission and/or reception mode(s)
- Tune HF and VHF frequencies
- Dial SATCOM Telephone (TEL) numbers
- Select voice or data mode
- Monitor and change data mode parameters
- Enter the Squawk (SQWK) code and squawk IDENT
- Load frequencies and phone numbers from the mailbox
- Select Standby Radio Navigation (STBY RAD NAV) and tune the NAVAIDs (only via RMP 1 and RMP 2).
  For information on standby radio navigation tuning, *Refer to DSC-34-NAV-70-30 How to Tune the Navaids in STBY RAD NAV*.
- Adjust the volume for voice communication and for NAVAID identification.

In addition to the RMPs, the flight crew uses:
- The CALLS panel to generate visual, and aural call indications (in the cabin and/or on the steering nose gear panel) via the flight and cabin interphones
- The Evacuation (EVAC) Panel ◁ , to initiate evacuation of the aircraft
- The Emergency Locator Transmitter (ELT) panel, to control the ELT.

L2 For more information on the RMPs, *Refer to DSC-23-10-10 RMP Architecture*.

Ident.: DSC-23-10-10-10-00000115.0001001 / 30 APR 14

L2 AUDIO MANAGEMENT UNIT (AMU)

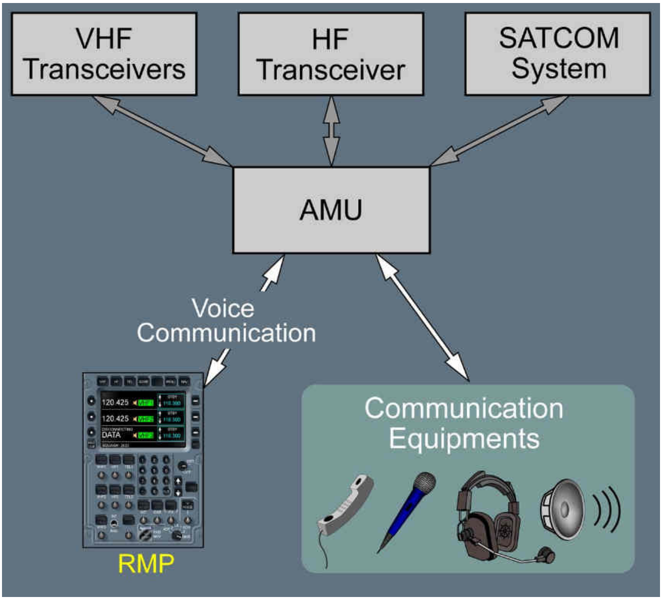
There are two Audio Management Units (AMUs) in the aircraft. The AMUs are located in the avionic bays.

The AMUs manage:
- communication transmission / reception of all the radio communication and radio navigation facilities,
- Internal communication.

L3 The AMUs manage, and adjust the volume of audio signals (analog) between the communication equipment and the:
- HF/VHF transceivers
- SATCOM system
- SELCAL
- NAVAID receivers (for NAVAID identification in STBY RAD NAV)
- Flight interphone
- Cabin Intercommunication Data System (CIDS) that includes:
  - The cabin interphone
  - The service interphone
  - The Passenger Address (PA).

L2 *Note: The cockpit handset is directly connected to the CIDS.*

L3 The AMU is the interface for the voice.



VHF Transceivers
HF Transceiver
SATCOM System
AMU
Voice Communication
RMP
Communication Equipments

L2 AVIONICS COMMUNICATION ROUTER (ACR)

The RMPs also transmit flight crew selections to the Avionics Communication Router (ACR). The ACR controls datalink communications for Air Traffic Control (ATC) and Airline Operational Communications (AOC) applications.

Note: *The ACR interfaces with:*
- *The Flight Management System (FMS)*
- *The ATC datalink system*
- *The Onboard Information System (OIS).*

The ACR is the interface for the data.

RMP SYNCHRONIZATION

The RMPs share selections and inputs to enable the flight crew to control all radio communication via any RMP.

L3 The RMPs share mainly the following data:
- Active and standby frequencies
- SATCOM channels and their status (e.g. logged on/off, cabin calls enabled/disabled, connected)
- Active function displays (e.g. Amplitude Modulation (AM))

L1 However, it is possible to display a different page on each RMP.

Ident.: DSC-23-10-10-20-00000119.0001001 / 14 APR 16

ACTIVE COMMUNICATION

In normal operation:
- The Captain controls communication via RMP 1
- The First Officer controls communication via RMP 2
- The third occupant controls communication via RMP 3
- The fourth occupant controls communication via the fourth occupant ACP ◁ .

RMPs 1 and 2 are directly connected to the VHF and HF transceivers.
L3 RMP 1 transmits all commands to VHF 1, VHF 3 and HF 1.
RMP 2 transmits all commands to VHF 2.
L1 RMP 3 transmits commands to RMP 1 or RMP 2, via the appropriate control connection. RMP 1 and/or RMP 2 then send these commands to the appropriate transceivers.
All three RMPs are directly connected to the SATCOM system.

Ident.: DSC-23-10-10-20-00000120.0001001 / 30 APR 14

STANDBY CONTROL

If a connection or an RMP fails, the communication system can automatically reconfigure to ensure continued communication control.
L3 Standby connections are activated instead of the failed connections.
L1 RMP 3 can be used, as a backup, instead of the failed RMP (not for STBY RAD NAV control).
For information on reconfiguration with RMP failures or with connection failures, *Refer to Abnormal operations chapter*.
If the FMS can no longer control the radio NAVAIDS (e.g. FMS failure), RMPs 1 and 2 can also be used, as a backup, to tune the NAVAIDS.

Intentionally left blank

FLIGHT INTERPHONE

Ident.: DSC-23-10-20-00000121.0001001 / 30 APR 14
Applicable to: ALL

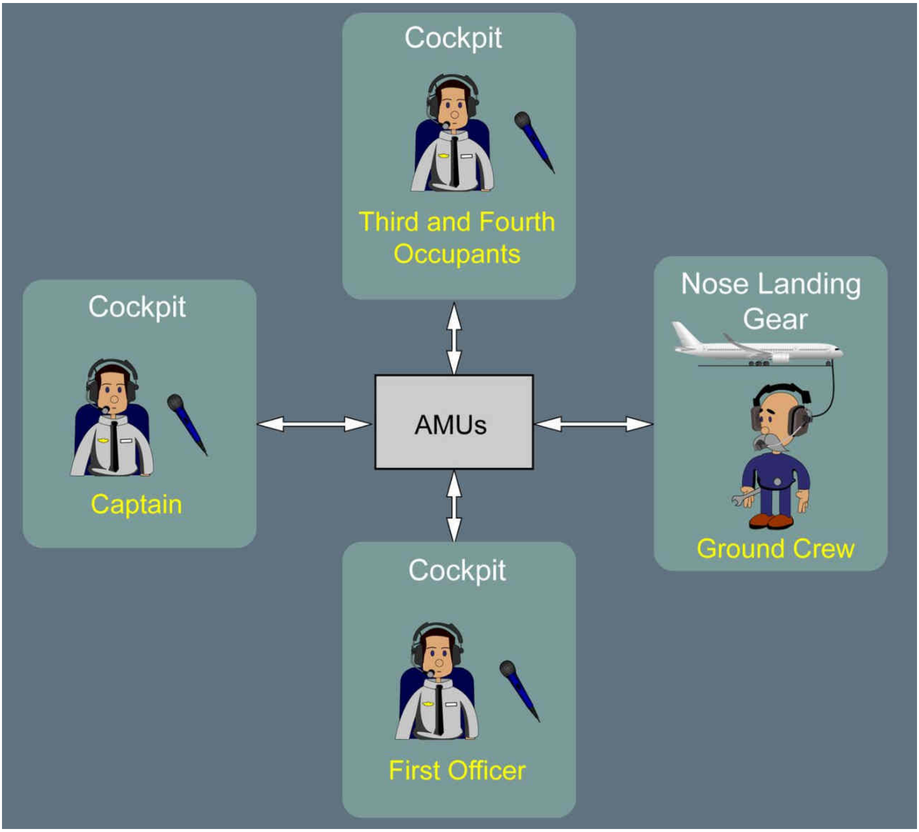
L3 The Audio Management Units (AMUs) host the flight interphone.

L1 The flight crewmembers use the flight interphone to communicate with each other, and with the ground crew via the:

- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks.

The ground crew can communicate with the flight crew via the FLT INT jack on the maintenance nose landing gear panel.

Flight Interphone



Cockpit
Third and Fourth Occupants
Cockpit
Captain
AMUs
Nose Landing Gear
Ground Crew
Cockpit
First Officer

Before transmitting via the flight interphone, on the RMP the flight crewmember must:
- Press and release the INT reception knob to the out position
- Press the INT transmission key
- Press a PTT sw or set the INT/RAD sw to RAD to transmit.

For permanent transmission (i.e. conference mode):
- Press and release the INT reception knob to the out position
- Set the INT/RAD sw to INT.

CABIN INTERPHONE

Ident.: DSC-23-10-20-00000122.0001001 / 30 APR 14
Applicable to: ALL

L3 The Cabin Intercommunication Data System (CIDS) hosts the cabin interphone.

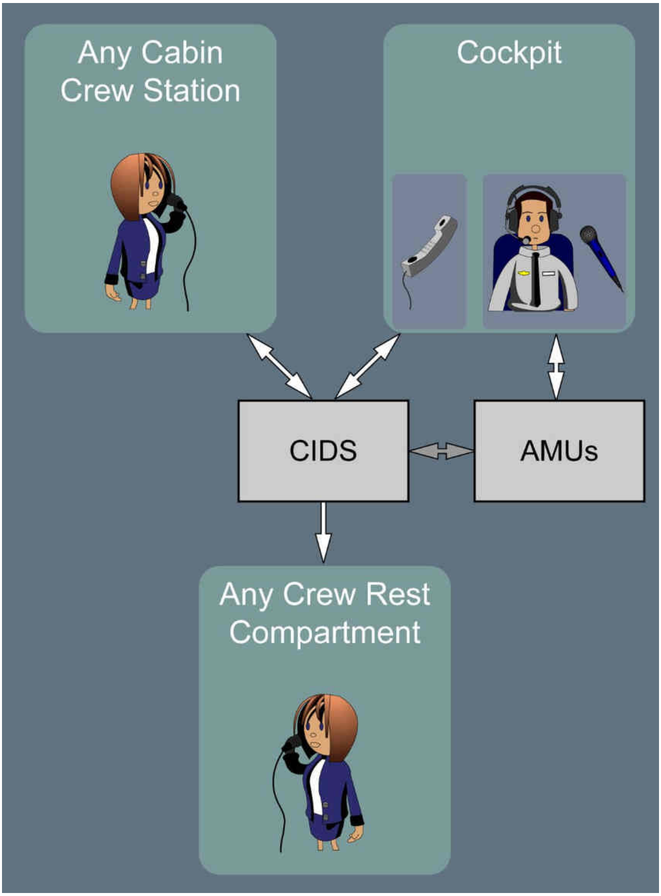
L1 The flight crew can use the cabin interphone to communicate with the cabin crew at any cabin crew station, and with a crewmember in a crew rest compartment via the:

- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks
- Cockpit handset.

L2 For more information *Refer to Cockpit handset description* .

L1 *Note:* *Cabin crewmembers can also use the cabin interphone to communicate with other cabin crewmembers that are at different attendant stations or in the crew rest compartment.*

Cabin Interphone



Any Cabin Crew Station
Cockpit
CIDS
AMUs
Any Crew Rest Compartment

Before transmitting via any other appropriate equipment, on the RMP the flight crewmember should:

- Press and release the CAB reception knob in the out position
- Press the CAB transmission key
- Press a PTT sw or set the INT/RAD sw to RAD to transmit.

PASSENGER ADDRESS (PA)

Ident.: DSC-23-10-20-00000132.0001001 / 30 APR 14
Applicable to: ALL

L3 The Cabin Intercommunication Data System (CIDS) hosts the PA.

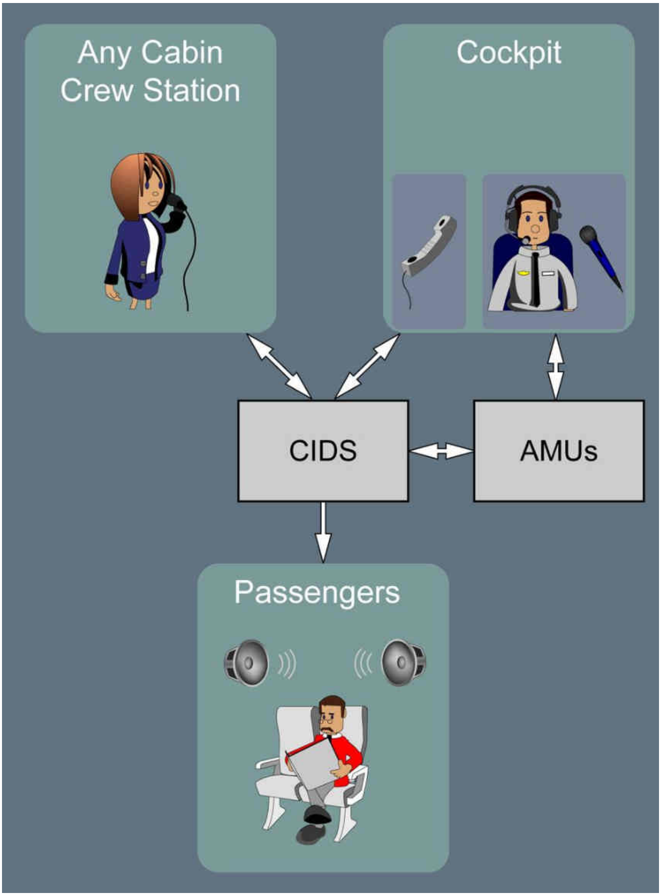
L1 The flight crew, and the cabin crew can use the PA to make announcements to the passengers via the:

- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks
- Cockpit handset.

L2 For more information *Refer to Cockpit handset description*.

For more information on the PA, *Refer to CCOM/General information on the Passenger Address system.*

PA



Any Cabin Crew Station
Cockpit
CIDS
AMUs
Passengers

L1 Before making an announcement via any other appropriate equipment, on the RMP the flight crewmember should:
- Press and release the PA reception knob to the out position
- Press and hold the PA transmission key on the RMP to make the announcement.

Note: It is not necessary to use a PTT sw.

SERVICE INTERPHONE

Ident.: DSC-23-10-20-00000134.0001001 / 07 NOV 18
Applicable to: ALL

L3 The Cabin Intercommunication Data System (CIDS) hosts the service interphone.

L1 The flight crew can use the service interphone to communicate with the cabin crew at any cabin crew station, and with the ground crew via the:
- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks
- Cockpit handset.

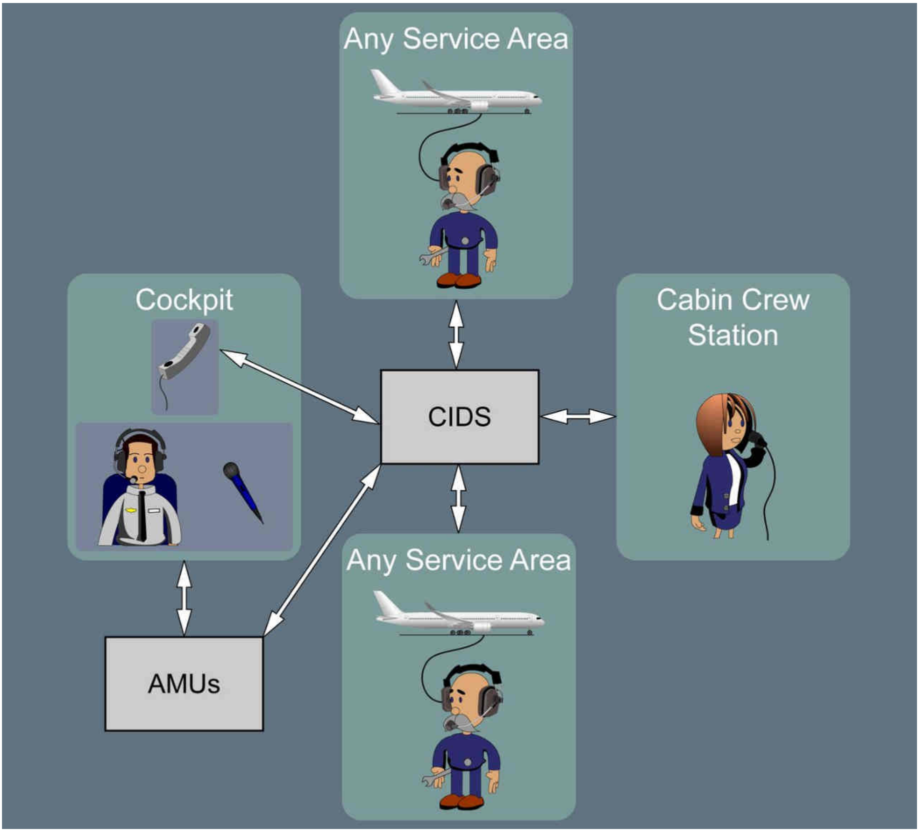
L2 For more information *Refer to Cockpit handset description*.

L1 The ground crew can communicate with the flight crew via any SVCE INT jack at any service area.

L2 There is a SVCE INT jack:
- At the nose landing gear maintenance panel
- In the APU bay
- In the avionic bay
- At several locations on the fuselage.

L1 *Note:* *Ground crewmembers can also use the service interphone to communicate with other ground crewmembers who are at different service areas.*

Service Interphone



Any Service Area
Cockpit
Cabin Crew Station
CIDS
AMUs
Any Service Area

Before transmitting via any other appropriate equipment, on the RMP the flight crewmember should:
- Press and release the CAB reception knob to the out position
- Press the CAB transmission key
- Press a PTT sw or set the INT/RAD sw to RAD to transmit.

Radiocommunication

VHF

Ident.: DSC-23-10-30-10-00000136.0001001 / 30 APR 14
Applicable to: ALL

The communication system has three VHF channels, and each channel has its own antenna.

L2 For antenna locations *Refer to DSC-20-20-20 Antenna Locations*

L3 Each VHF transceiver operates within a frequency band that ranges from 118.000 MHz to 136.975 MHz, by increments of 8.33 kHz.

L1 VHF 1 and VHF 2 are for short-range communication in voice mode only.
VHF 3 is mainly for short-range communication in data mode. VHF 3 can be a backup for communication in voice mode.

L3 Data communication is automatically transferred to the SATCOM if:
- VHF 3 is in voice mode, or
- The aircraft is outside the range of a VHF station.

The Operator can customize the configuration software that defines the policy for Avionics Communication Router (ACR) transfers.

HF

Ident.: DSC-23-10-30-10-00000137.0001001 / 08 NOV 18
Applicable to: ALL

The communication system has:
- Two independent HF channels (HF 1 and HF 2 ◁) that operate either in Amplitude Modulation (AM) or Single Side Band (SSB) mode and
- One antenna.

L2 The flight crew can select the AM or SSB mode via the HF page on any RMP.
For antenna locations *Refer to DSC-20-20-20 Antenna Locations*

L1 HF 1 and HF 2 ◁ are for long-range communication in voice mode and in data mode ◁ .
The two channels (HF 1 and HF 2 ◁) use the same antenna, and cannot transmit simultaneously.

L3 HF voice transceiver operates within a frequency band that ranges from 2 MHz to 29.999 MHz, by increments of 1 kHz.

L2 In case of simultaneous voice and data transmission, voice communication takes priority over data communication. Simultaneous reception is possible, when HF is not in transmission.

L3 On ground, HF data mode ◁ communication is automatically inhibited. For maintenance purposes, the ground crew can override the inhibition of the data mode using the GND HF DATALINK pb-sw

◁ on the overhead maintenance panel. Manual override is nevertheless not possible during refueling / defueling / fuel transfer operations.

SATCOM

SATCOM

Ident.: DSC-23-10-30-20-00000138.0001001 / 06 NOV 14
Applicable to: ALL

The flight crew, the cabin crew, and the passengers use the SATCOM to communicate with ground, in voice and data modes.

The SATCOM system supports five channels of simultaneous operation:
- Two channels are allocated to cockpit voice
- One to data
- Two to swiftbroadband.

L2 Swiftbroadband allows more simultaneous users and provides voice and high-speed data to cabin passengers services.
For information on priority levels, *Refer to DSC-23-20 Priority Level*.

L1 The SATCOM has:
- An antenna to exchange signals with Ground Earth Stations (GES), via geostationary satellites
L2 For localization *Refer to DSC-20-20-20 Antenna Locations*
L3 - A Satellite Data Unit (SDU), that encodes/decodes the voice and data signals that are exchanged between the GES and the aircraft systems
  The SDU interfaces with the RMPs, the AMUs, and the ACR.
  Voice communication is exchanged via the AMUs, and data communication via the ACR.
  The SDU also receives aircraft position and aircraft attitude data from the Air Data and Inertial Reference Units (ADIRUs), in order to send an appropriate steering command to the HGA.
- A High Power Amplifier (HPA), that amplifies SDU signals.
- A Diplexer / Low Noise Amplifier (D/LNA) that amplifies the signal received from the satellite and permits to transmit and emit at the same time.
- A High Gain Antenna (HGA) that integrates the Beam Steering function in order to steer the antenna to track the selected satellite.

The SATCOM system is not available, when the position of the aircraft exceeds a latitude of 80 ° North or 80 ° South.

Note: *The coverage is guaranteed between 72 ° north latitude and 72 ° south latitude.*

L1 The flight crew can select either one of the following functions for SATCOM connection to a GES:
- The AUTO LOG ON function
  The SATCOM automatically selects the satellite and the GES .
- The MANUAL LOG ON function
  The flight crew manually selects the satellite and the GES .

The flight crew uses the LOG OFF function to disconnect the SATCOM.

SELCAL

SELCAL

Ident.: DSC-23-10-30-30-00000139.0001001 / 06 MAR 15
Applicable to: ALL

In order to help the selection of the numerous VHF or HF messages, the Selective Calling (SELCAL) identifies incoming VHF or HF calls that have the aircraft-specific SELCAL code. SELCAL then triggers visual and aural alerts:

- On the RMP, the CALL light of the corresponding VHF or HF transmission key flashes in amber and the Reset (RST) key comes on in amber.
- A buzzer sounds in the cockpit until the flight crew presses the RST key of the RMP, or the flight crew answers the call.

Note: *The buzzer sounds when an incoming call is identified, regardless of the setting of the loudspeaker volume, but is inhibited during takeoff and landing.*

MECH CALL pb

When pressed:
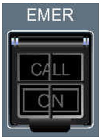
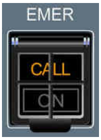
- The COCKPIT CALL light on the maintenance nose gear panel comes on
- An external horn sounds as long as the flight crew maintains the MECH CALL pb pressed.

Ident.: DSC-23-20-70-00000238.0001001 / 17 NOV 17

EMER pb



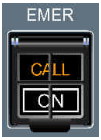
Neither the flight crew nor the cabin crew has made an EMER call.



The cabin crew has made an EMER call:

- The CALL light flashes or come on steady
- A buzzer sounds three times through the cockpit loudspeakers
- The ATT transmission key flashes amber on all RMPs.

Note: *The selection of flashing/steady mode can be assigned via the Cabin Assignment Module (CAM).*



When pressed by the flight crew:
- The ON light and the CALL light come on steady
- A pink light, on all the ACPs in the cabin, flashes or comes on steady
- The EMER CAPT message appears at all AIPs and a red light comes on
- Three successive high/low chime are dispatched via cabin loudspeakers.

Crew rest compartments ⊲ are also called.

Note: The selection of flashing/steady mode can be assigned via the Cabin Assignment Module (CAM).

Ident.: DSC-23-20-70-00000242.0001001 / 06 NOV 14

ALL pb

When pressed:
- A pink light, on all the ACPs in the cabin, comes on. For information on the ACPs, *Refer to CCOM/04-20-20 Area Call Panel (ACP)*
- The CALL ALL CAPT message appears on all AIPs in the cabin. For information on the AIPs, *Refer to CCOM/04-20-20 Attendant Indication Panel (AIP)*
- A high/low chime sounds through the cabin loudspeakers.

Ident.: DSC-23-20-70-00000233.0001001 / 30 APR 14

PURS pb

When pressed:
- A pink light, on the Purser Area Call Panel (ACP), comes on
- The CAPTAIN CALL message appears on the Purser Attendant Indication Panel (AIP)
- A high/low chime sounds through the associated cabin loudspeakers.

Ident.: DSC-23-20-70-00011269.0001001 / 30 APR 14

FWD(MID)(EXIT)(AFT) pb

When pressed:
- A pink light, on the FWD(MID)(EXIT)(AFT) ACPs in the cabin, comes on. For information on the ACPs, Refer to CCOM/Area Call Panel (ACP)
- The CALL FWD(MID)(EXIT)(AFT) CAPT message appears on all AIPs in the cabin. For information on the AIPs, Refer to CCOM/attendant Indication Panel (AIP)
- A high/low chime sounds through the cabin loudspeakers

COCKPIT HANDSET DESCRIPTION

Applicable to: ALL

Ident.: DSC-23-20-105-00000124.0001001 / 03 JAN 20

The flight crew can use the cockpit handset:
- For passenger address
- For internal communication to each cabin or CCRC handset
- For communication with ground crew to each service area.

L3 The company can customize the CIDS to permit the crew to have access to optional functions through the Cabin Assignment Module (CAM) (100000 parameter compilation).

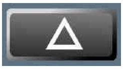
Line 3: Soft menu line

Ident.: DSC-23-20-105-00000127.0001001 / 03 JAN 20

SOFT MENU SELECTION KEYS

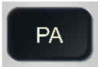


When pressed, access the relevant menu or function displayed on the soft menu line.

Ident.: DSC-23-20-105-00000128.0001001 / 03 JAN 20

FUNCTION KEYS

PASSENGER ADDRESS (PA) KEY



When pressed, access the PA menu on the dialing feedback line.

After the access to the PA menu, the flight crew can choose a specific zone for passenger address using:

- Area selection key, or
- Soft menu selection key.

To transmit voice message, the flight crew will push and keep pushed the PTT key.

PRIO KEY

L12

When pressed, access the PRIO menu on the dialing feedback line. After the access to the PRIO menu the flight crew can press PURS or CONF key to change the priority.
To transmit voice message, the flight crew will push and keep pushed the PTT key.

Note: *For the handset operation, the following order of priority is defined (level 1 is the highest priority) :*
- *Level 1: Emergency call (EMER)*
- *Level 2: Calls from cockpit*
- *Level 3: Priority calls (PRIO)*
- *Level 4: Purser calls (PURS)*
- *Level 5: Conference calls (CONF)*
- *Level 6: Normal calls*

For passenger address operation, the following order of priority is defined (not combined with interphone) :
- *Level 1: PA from AMU (cockpit)*
- *Level 2: Direct passenger address (Direct PA)*
- *Level 3: Priority passenger address (PRIO PA)*
- *Level 4: Normal passenger address (PA)*

CONF KEY

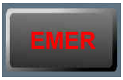
When pushed, access the CONF menu on the dialing feedback line.
The flight crew chooses the desired zone for conference interphone calls by using the soft menu selection key.
The flight crew will push the SEND key to activate the CONF call.

PURS KEY

When pushed, access the PURS menu on the dialing feedback line.
The flight crew will push the SEND key after PURS key to activate the purser call.

EMER KEY

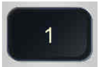
L12



When pushed, initiates an emergency call to all the handsets in the cabin.
For activation of the emergency call the flight crew must press the EMER key at least 1 s.
This key also requires higher pressure than the others.
The emergency call has priority over any other function or call.

Ident.: DSC-23-20-105-00000129.0001001 / 03 JAN 20

AREA SELECTION KEYS

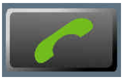


When pressed, selects the correspondent zone for PA.

Ident.: DSC-23-20-105-00000130.0001001 / 03 JAN 20

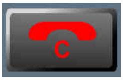
INTERPHONE TRANSMISSION CONTROL KEYS

SEND KEY



When pressed, calls the selected interphone address

C. KEY

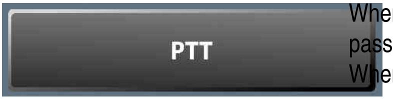


When pressed:
- Undo or deletes the last selection menu, or
- Stops the conversation.

Ident.: DSC-23-20-105-00000131.0001001 / 03 JAN 20

PUSH TO TALK KEY

L12



When pressed and keep pressed, directly access to passenger for the entire aircraft.
When specific areas are selected before the PTT key is pressed, announcements will be made on these areas only.
This mode overrides all other active announcements.

Normal Operation. Neither the Captain nor the Chief Purser order an evacuation.

The Chief Purser requests or orders an evacuation.

If the CAPT & PURS/CAPT sw is set to CAPT position, when the Chief Purser requests an evacuation:
- The EVAC light comes on
- A horn sounds in the cockpit during 3 s.

If the CAPT & PURS/CAPT sw is set to CAPT & PURS position, when the Chief Purser orders an evacuation:
- The EVAC light flashes
- A horn sounds continuously in the cockpit
- The EVACUATION ALERT message appears on all Attendant Indication Panels (AIP) in the cabin
- EVAC CMD pb on FAPs, and AAPs will be lit in the cabin
- The evacuation horn sounds in the cabin.

The Flight Crew orders an evacuation, regardless of the CAPT & PURS/CAPT sw position (CAPT or CAPT & PURS).

When pressed:
- The ON light and the EVAC light flashes
- The EVACUATION ALERT message appears on all Attendant Indication Panels (AIP) in the cabin
- EVAC CMD pb on FAPs, and AAPs will be lit in the cabin
- The evacuation horn sounds continuously in the cabin.

Ident.: DSC-23-20-80-00000240.0001001 / 03 JUL 20

2 HORN OFF pb

SQUAWK: 2123

HF Page

The illustration indicates:
- HF 1 is in transmission (AM mode) and reception mode
- The active frequency is 12.020 MHz
- The standby frequency is boxed to indicate that it is selected for modification.

Ident.: DSC-23-20-20-00000199.0001001 / 30 APR 14

LOUDSPEAKER SYMBOL

	When there is no display, indicates reception mode is off.
🔈	The active frequency is in reception mode.
L13 🔇	The active frequency is in transmission mode, but not in reception mode. When the flight crew turns on the transmission mode only, the symbol flashes for 2 s, and then remains steady.

Ident.: DSC-23-20-20-00000200.0001001 / 30 APR 14

TRANSCEIVER IDENTIFICATION

HF1	HF 1 is not in transmission mode.
HF1	HF 1 is in transmission mode.

Ident.: DSC-23-20-20-00000201.0001001 / 07 JUL 16

ACTIVE FREQUENCY

12.020

The HF transceiver is tuned on the displayed frequency.

L12

--.---

The HF transceiver is in voice mode, and is either failed or not available.

For information on possible failures:
- *Refer to DSC-23-30-20 RMP Synchronization Failure*
- *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure*.

DATA

The HF transceiver is in data mode ◁✳ .

L12

The HF transceiver is in data mode ◁✳ , and is either failed or not available.

For more information on possible failure:
- *Refer to DSC-23-30-20 RMP Synchronization Failure*
- *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure*

Ident.: DSC-23-20-20-00000202.0001001 / 07 MAY 18

STANDBY (STBY) FREQUENCY

15.500

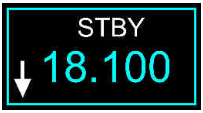
The standby frequency is displayed and cannot be changed.

L12

--.---

The HF transceiver is in voice mode and is either failed, or not available. For an example of failure, *Refer to DSC-23-30-20 RMP Synchronization Failure*.

L12



STBY
18.100

When boxed, the standby frequency can be modified.

A voice standby frequency displays:
- In large characters until it is inserted, via the appropriate LSK
- In small characters after insertion.

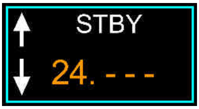
Note: *After a flight crewmember modifies the standby frequency, they should insert it, in order to prevent inadvertent modification of the frequency.*

The up-arrow and the down-arrow indicate that the list of frequencies can be scrolled up, or down.

The list contains the following frequencies:
- 8.364 MHz
- The modifiable frequency.

When the flight crew enters a frequency, via the numerical keypad, the modifiable frequency appears automatically whatever the current display.

L12



STBY
24. - - -

The standby frequency is not a standard HF voice frequency. The flight crew can clear the erroneous digits, via the CLR key, until the standby frequency displays in blue again.
The HF1 FREQ NOT VALID RMP message is also displayed.
For more information on this message, *Refer to DSC-23-20 VHF 1(2)(3)/HF 1 FREQ NOT VALID*.

Ident.: DSC-23-20-20-00000203.0001001 / 30 APR 14

AMPLITUDE MODULATION FUNCTION

HF1 AM SELECT ON*

HF 1 is in Single Side Band (SSB) mode. When the flight crew presses the associated LSK, the Amplitude Modulation (AM) mode activates.

HF1 AM ON : SELECT OFF*

HF 1 is in Amplitude Modulation (AM) mode. When the flight crew presses the associated LSK, the Single Side Band (SSB) mode activates.

Ident.: DSC-23-20-20-00000204.0001001 / 30 APR 14

AMPLITUDE MODULATION DISPLAY

When there is no display, indicates that Single Side Band (SSB) mode is active.

AM

Amplitude Modulation (AM) mode is active.

NAV PAGE

Ident.: DSC-23-20-00000184.0001001 / 30 APR 14
Applicable to: ALL

The flight crew uses the NAV page to tune the NAVAID frequencies/channel when FMS 1 and FMS 2 are failed.
This page is available on RMP 1 and RMP 2 only. The flight crew must press the RAD NAV STBY key to enable the NAV page access key.

L2 For more information on how to tune the navaid in standby mode, *Refer to DSC-34-NAV-70-30 How to Tune the Navaids in STBY RAD NAV*.

Scroll Keys

Ident.: DSC-23-20-06-00000189.0001001 / 30 APR 14

Line Selection KEYS : LSK 1(2)(3)

When pressed, selects, validates, or activates the corresponding displays (e.g. frequencies, functions, page titles).

Ident.: DSC-23-20-06-00000190.0001001 / 30 APR 14

Activation/Dialing KEYS : ADK 1(2)(3)

When pressed, dials, selects, validates, activates the corresponding displays (e.g. frequencies, functions).

Ident.: DSC-23-20-06-00000191.0001001 / 30 APR 14

MESSAGE CLEAR (MSG CLR) KEY

When pressed, clears any displayed RMP message.

Note: *Does not clear the squawk code that appears on the VHF, HF and TEL pages.*

Ident.: DSC-23-20-06-00000192.0001001 / 30 APR 14

NUMERICAL KEYPAD

NUMBER KEYS

When pressed, inserts the corresponding number at the cursor position, in the field selected for modification.

DECIMAL KEY

Not active. The decimal is automatically-entered where necessary.

CLR KEY

- When pressed and released, clears the last digit
- When pressed and maintained, clears the field selected for modification, and displays the last validated entry.

Ident.: DSC-23-20-06-00000193.0001001 / 30 APR 14

SCROLL KEYS

UP KEY

- When pressed and released, scrolls up a list of items provided that an up arrow is displayed in the field that is selected for modification.
- When pressed and maintained, displays the first item of the list.

DOWN KEY

- When pressed and released, scrolls down a list of items provided that a down arrow is displayed in the field that is selected for modification.
- When pressed and maintained, displays the last item of the list.

Ident.: DSC-23-20-06-00000194.0001001 / 30 APR 14

VHF 1(2)(3)/HF 1(2)/TEL 1(2) TRANSMISSION KEYS AND Reception knobS

VHF 1(2)(3)/HF 1(2)/TEL 1(2) Transmission KEYS

The associated communication means (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is not in transmission mode. When pressed, the transmission key turns on the transmission mode.

Note: *Only one communication means at a time (internal and external communication) can be in transmission mode on each RMP.*

The associated communication means (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is in transmission mode. When pressed, the transmission key turns off the transmission mode.
The TEL 1(2) transmission key flashes to indicate that an outgoing telephone call is connected, and TEL 1(2) is not in transmission mode. When pressed, the TEL 1(2) transmission key activates the transmission mode and enables the telephone communication.

Flashes to indicate an incoming:
- Telephone call, or
- SELCAL.

When a telephone call, or a SELCAL is received, a buzzer sounds in the cockpit until it is reset, via the RST key, or the flight crew answers the call.

VHF 1(2)(3)/HF 1(2)/TEL 1(2) Reception knobS

The associated communication means (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is not in reception mode. When pressed and released in the out position, the reception knob turns on the reception mode.

The associated communication means (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is in reception mode. When pressed and released in the in position, the reception knob turns off the reception mode.
When turned, the reception knob adjusts the volume of the headset.

RMP MESSAGES

Applicable to: ALL

Ident.: DSC-23-20-100-00000156.0001001 / 07 NOV 16

RMP MESSAGES

The RMP displays messages to inform the flight crew, when:
- A selection is not appropriate, or not complete, or
- A connection is failed, or
- Voice or data mode is not available.

Note: *The current squawk is displayed by default in the scratchpads of the VHF, HF, and TEL pages. In addition, in the case the XPDR is not in the AUTO mode, the current XPDR mode (i.e. ON or STBY) is also displayed.*

L3 An RMP message can be displayed on all RMPs simultaneously (global display), or on one RMP only (local display). However, some local messages can be displayed on more than one RMP, provided that the same page is displayed.
If several messages are displayed one after the other without being cleared, the active messages are stored in a queue, in their order of appearance (the RMP displays the most recent message).
The flight crew must check, and clear the active messages, one by one, in order to cancel the queue.

L1 The various RMP communication messages are listed below:

Ident.: DSC-23-20-100-00000253.0001001 / 30 APR 14

L12

DATA FIELD NOT MODIFIABLE : The flight crew tries to modify a field that cannot be modified.

Ident.: DSC-23-20-100-00000254.0001001 / 30 APR 14

L12

VHF 3 DATA MODE NOT AVAILABLE : The flight crew tries to activate VHF 3 in data mode, but the data mode is not available.

Ident.: DSC-23-20-100-00000255.0001001 / 30 APR 14

L12

VHF 1(2)(3) / HF 1 FREQ NOT COMPLETED : The flight crew tries to validate a frequency that is not complete.

Ident.: DSC-23-20-100-00000256.0001001 / 30 APR 14

L12

VHF 1(2)(3) / HF 1 FREQ NOT VALID : The flight crew enters a frequency that is not a standard VHF / HF voice communication frequency.

Ident.: DSC-23-20-100-00000257.0001001 / 30 APR 14

L12

VHF 1(2)(3) / HF 1 / TEL 1(2) RECEPTION NOT SELECTED : The flight crew selects VHF 1(2)(3) / HF 1 / TEL 1(2) in transmission mode, but the reception mode is not active.

Ident.: DSC-23-20-100-00000258.0001001 / 30 APR 14

L12

VHF 1(2)(3) / HF 1 STBY REVERTED TO PREV ENTRY : The flight crew tries to validate a frequency that is not a standard VHF / HF voice frequency, and the VHF 1(2)(3) / HF 1 FREQ NOT VALID message is already displayed. The last validated STBY frequency appears instead of the invalid entry.

Ident.: DSC-23-20-100-00000259.0001001 / 30 APR 14

L12

HF 1 VOICE MODE NOT AVAILABLE : The flight crew tries to activate HF 1 in voice mode, but the voice mode is not available.

Ident.: DSC-23-20-100-00000260.0001001 / 30 APR 14

L12

LOG OFF TO MODIFY SATCOM SETTINGS: The flight crew tries to modify the SATCOM settings, but the SATCOM is logged on.

Ident.: DSC-23-20-100-00000261.0001001 / 30 APR 14

L12

MAN DIALING NOT ALLOWED : The flight crew tries to manually dial a telephone number, but the SATCOM configuration software does not permit it.

Ident.: DSC-23-20-100-00000262.0001001 / 30 APR 14

L12

NO MORE LIST ITEMS : The flight crew tries to scroll through a list and the first (last) element of the list is displayed.

Ident.: DSC-23-20-100-00000263.0001001 / 30 APR 14

L12

NO NUMBER DIALED : The flight crew tries to make a telephone call by pressing an ADK, but has not dialed a telephone number.

Ident.: DSC-23-20-100-00000264.0001001 / 30 APR 14

L12

SATCOM CONFIG PAGE NOT AVAIL : The flight crew presses the SATCOM CONFIG page access key, but the SATCOM or the connections between the RMPs and the SATCOM are failed.

Ident.: DSC-23-20-100-00000265.0001001 / 30 APR 14

L12

SATCOM LOG ON: FAIL : The flight crew tries to log on the SATCOM, but the log on fails.

Ident.: DSC-23-20-100-00000266.0001001 / 30 APR 14

L12

SATCOM SETTING PAGE NOT AVAIL : The flight crew presses the SATCOM SETTING page access key, but the SATCOM, or the connections between the RMPs and the SATCOM are failed.

Ident.: DSC-23-20-100-00000267.0001001 / 30 APR 14

L12

TEL 1(2) CONNECTION: FAIL : The flight crew tries to make a telephone call, but it cannot be established or it is interrupted due to a failure.

Ident.: DSC-23-20-100-00000268.0001001 / 30 APR 14

L12

TEL 1(2) NOT CONNECTED : The flight crew selects TEL 1(2) in transmission mode, but no connection is established.

Ident.: DSC-23-20-100-00000269.0001001 / 30 APR 14

L12

TEL 1(2) REVERTED TO PREV ENTRY : The flight crew dials a telephone number, then clears it by using the MSG CLR key.

Ident.: DSC-23-20-100-00000270.0001001 / 30 APR 14

L12

TEL 1(2) STILL CONNECTED : The flight crew tries to end a telephone call that is still connected.

Ident.: DSC-23-20-100-00000271.0001001 / 30 APR 14

L12

USE MAN SCAN TO MODIFY PROVIDER	:	The flight crew tries to modify the VHF datalink provider on the VHF DATALINK PROVIDER page, and the AUTO SCAN function is active.

INT/RAD SWITCH

The flight crew uses the INT/RAD sw to activate the boomset, or the oxygen mask microphones.

The switch on:
- RMP 1 controls the microphones for the Captain
- RMP 2 controls the microphones for the First Officer
- RMP 3 controls the microphones for the third occupant.

The Interphone/Radio Push-To-Talk switch (INT/RAD sw) is in the off position.

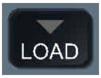
- When set to RAD, the INT/RAD sw activates the boomset or the oxygen mask microphone. However, the appropriate transmission key should be selected first, in order to transmit the message.
- When released, the INT/RAD sw returns to the off position.

- When set to INT, the INT/RAD sw activates the boomset or the oxygen mask microphone.
- When released, the INT/RAD sw remains in the INT position, until the flight crew selects another.

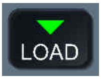
Note: *When set to INT position induces an attenuation of the loudspeaker in the cockpit.*

Ident.: DSC-23-20-05-00020046.0001001 / 30 APR 14

LOAD KEY



Load key is not active.

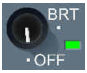


The light comes on when a VHF or HF CPDLC frequency is received on the mailbox. When pressed, provided that the corresponding HF or VHF page and LSK KEY is selected on the RMP, loads and displays the frequency automatically.

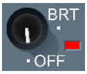
Ident.: DSC-23-20-05-00000179.0001001 / 30 APR 14

BRT/OFF knob

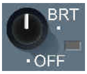
The flight crew uses the BRT/OFF knob to turn the RMP on or off, and to adjust the brightness of the RMP screen.
The status indicator changes color to indicate the status of the RMP.



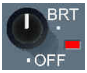
The RMP is OFF and is available.



The RMP is OFF, and is failed.



The RMP is on.



The RMP is on, but is failed.

Ident.: DSC-23-20-05-00000180.0001001 / 28 APR 17

RST KEY

The Reset (RST) key is not active.

The RST key goes on in amber, when the buzzer sound associated to an incoming SELCAL, or telephone call is generated.
When the RST key is pressed, the buzzer sound is canceled, and the RST light goes off.

Ident.: DSC-23-20-05-00000181.0001001 / 30 APR 14

RAD NAV CONTROLS AND INDICATORS

For more information for description. *Refer to DSC-34-NAV-70-20 STBY RAD NAV Key*

Ident.: DSC-23-20-05-00000182.0001001 / 30 APR 14

INT(CAB)(PA) TRANSMISSION KEY AND Reception knob

INT(CAB)(PA) Transmission KEY

The associated interphone (i.e. INT, CAB, or PA) is not in transmission mode.
When pressed, the transmission key turns on the transmission mode.

Note: *Only one communication type at a time (internal and external communication) can be in transmission mode on each RMP.*

The associated interphone (i.e. INT, CAB, or PA) is in transmission mode.
When pressed, the transmission key turns off the transmission mode.

Note: *To make an announcement on the PA, the flight crew must press and maintain the PA transmission key during the announcement. In this case, it is not necessary to use any PTT sw.*

Flashes to indicate an incoming:
- Call from the ground crew (MECH light), or
- Call from the cabin crew (ATT light).

When a ground(cabin) crew call is received, a buzzer sounds in the cockpit, and the MECH(ATT) light flashes for 60 s, or until the flight crew answers the call.

INT(CAB)(PA) Reception knob

The associated interphone (i.e. INT, CAB, or PA) is not in reception mode. When pressed and released in the out position, the reception knob turns on the reception mode.

The associated interphone (i.e. INT, CAB, or PA) is in reception mode. When pressed and released in the in position, the reception knob turns off the reception mode.
When turned, the reception knob adjusts the volume of the headset.

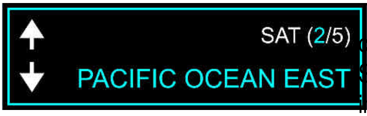
SATELLITE NAME

 SAT (2/5) PACIFIC OCEAN EAST	The SATCOM is not connected, and the flight crew cannot change the satellite name.
 SAT (2/5) PACIFIC OCEAN EAST	The SATCOM is connected, and the flight crew cannot change the satellite name.

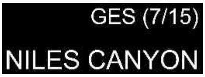
L12



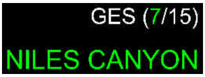
The SATCOM is not connected, and the flight crew can change the satellite name, because it is boxed.
SAT(2/5) indicates that PACIFIC OCEAN EAST is second in the list of satellites, and there are 5 satellites currently available.
The up and down arrows indicate that the flight crew can scroll through the list of currently available satellites.

Ident.: DSC-23-20-50-00000230.0001001 / 06 NOV 14

GROUND EARTH STATION (GES) NAME

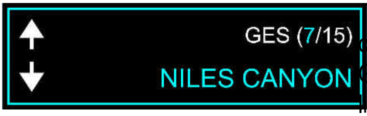


The SATCOM is not connected, and the flight crew cannot change the GES.



The SATCOM is connected, and the flight crew cannot change the GES.

L12



The SATCOM is not connected. The GES is boxed, and can be changed.
GES(7/15) indicates that NILES CANYON is seventh in the list of GES, and there are 15 GES currently available.
The up and down arrows indicate that the flight crew can scroll through the list of currently available GES.

Ident.: DSC-23-20-50-00000231.0001001 / 30 APR 14

RETURN FUNCTION

When selected, the previous page (SATCOM CONFIG) appears.

SQWK PAGE

Ident.: DSC-23-20-00000185.0001001 / 30 APR 14
Applicable to: ALL

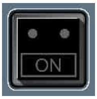
The flight crew uses the SQWK page to:

- Set the squawk,
- Activate the IDENT function. *Refer to DSC-34-SURV-50-20 RMP*

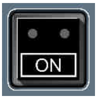
SVCE INT OVRD pb

Ident.: DSC-23-20-00000160.0001001 / 30 APR 14
Applicable to: ALL

L2 SVCE INT OVRD pb



The service interphone is automatically inhibited in flight.



If the service interphone remains abnormally inhibited on ground, the ground crew can manually activate it, by pressing the SVCE INT OVRD pb .
